NERCHINSK MINING DISTRICT (29,450 sq.m.) includes all the silver, lead and tin mines and gold-fields between the Shilka and the Argun, together with a few on the left bank of the Shilka. It is traversed by several parallel chains of mountains which rise to 4,500 ft., and are intersected by a complicated system of deep, narrow valleys, densely wooded, with a few expansions along the larger rivers, where the inhabitants with difficulty raise some rye and wheat. The Nerchinsk mountains, not yet fully surveyed, form the watershed between the streams flowing south-east into the Argun and the Onon, Unda and Shilka on the north-west. They consist of crystalline slates and limestones interspersed with granite, syenite and diorite; they contain rich ores of silver, lead, tin and iron, while the diluvial and alluvial valley formations contain auriferous sands; asbestos is found near the tin.

The Nerchinsk silver mines began to be worked in 1704, but during the first half of the 18th century their yearly production did not exceed 8,400 oz., and the total amount for the first 150 years (1704–1854) amounted to 11,540,000 ounces. Transport

and climatic difficulties have prevented the exploitation of the minerals in the region and the silver mines were closed in 1900. If the present scheme of linking the mines to the main railway is carried out, production may redevelop. The more easily reached veins of silver have been exhausted and expensive plant would be needed to work the deeper veins. Gold was first discovered in 1830, and between 1833 and 1855 260,000 oz. of gold dust were obtained. In 1864 a large number of auriferous deposits were discovered. Until 1863 all the labour was performed by serfs and convicts, numbering usually nearly four thousand. The output of gold up to 1914 was about 171,000 oz. troy, but is very small at present (1928).

NEREUS, in Greek mythology, the eldest son of Pontus and Gē, and father of the Nereids. He is represented as a beneficent and sage old man of the sea. The only myth concerning him is that Heracles compelled him, although, like Proteus, he assumed various forms, to tell him the way to the Hesperides (Apollodorus ii. 115). The Nereids are mermaids. Amphitrite (consort of Poseidon) and Thetis (see PELEUS) are the best known; Galatea is a Sicilian figure, loved by the Cyclops Polyphemus. The name has nothing to do with the modern Greek νερόν (really νερόν, "fresh" [water]).

NERGAL, the name of a solar deity in Babylonia, the main seat of whose cult was at Kutha or Cuthah, represented by the mound of Tell-Ibrahim. The importance of Kutha as a religious and at one time also as a political centre led to his surviving the tendency to concentrate the various sun-cults of Babylonia in Shamash (q.v.). He becomes, however, the representative of a certain phase only of the sun and not of the sun as a whole. Portrayed in hymns and myths as a god of war and pestilence, Nergal represents the sun of noon-time and of the summer solstice which brings destruction to mankind. Nergal is pictured also as the deity who presides over the nether-world, and stands at the head of the special pantheon assigned to the government of the dead, who are supposed to be gathered in a large subterranean cave known as Arallu or Irkalla. In this capacity there is associated with him a goddess Allatu or Erishkigal, though there are indications that at one time Allatu was regarded as the sole mistress of Arallu. Ordinarily the consort of Nergal is Laz. Nergal was pictured as a lion and his symbol is a griffin with panther's head, sometimes supporting his other symbol, a weapon with two panther heads.

As in the case of Nin-urta, Nergal appears to have absorbed a number of minor solar deities, which accounts for the various names or designations under which he appears, such as Lugalgira, Sharrapu, ("the burner," perhaps a mere epithet), Ira or Gira, Gibil (though this name more properly belongs to Nusku, q.v.). A certain confusion exists in cuneiform literature between Nin-urta and Nergal, perhaps due to the traces of two different conceptions regarding these two solar deities. Nergal is called the "raging king," the "furious one," and the original Sumerian name consists of three elements, Ne-urugal, "might of the great dwelling" and thus at the head of the nether-world a pantheon is indicated. In the astral-theological system he is the planet Mars, while in ecclesiastical art the great lion-headed colossi serving as guardians to the temples and palaces seem to be a symbol of Nergal, just as the bull-headed colossi probably typify Nin-urta.

The name of his chief temple at Kutha was E-shid-lam, from which the god receives the designation of Shidlamtāea, "the one that rises up from Shidlam." The cult of Nergal does not appear to have been as widespread as that of Nin-urta. He is frequently invoked in hymns and in votive and other inscriptions of Babylonian and Assyrian rulers, but we do not learn of many temples to him outside of Kutha. Sennacherib speaks of one at Tarbisu to the north of Nineveh, but although Nebuchadrezzar II. (606-586 B.C.), the great temple-builder of the neo-Babylonian monarchy, alludes to his operations at E-shid-lam in Kutha, he makes no mention of a sanctuary to Nergal in Babylon. Local associations with his original seat—Kutha—and the conception formed of him as a god of the dead acted in making him feared rather than actively worshipped. He is often spoken of as a god who passed judgment on the souls of the dead, and in the late period

arose the theory of compensation at his hands in Arallu for the righteous, and thus arose the late Hebrew belief in rewards after death to explain the problem of providence.

NERI, PHILIP (FILIPPO DE), Saint (1515-1595). Italian churchman, was born at Florence on July 21, 1515, the youngest child of Francesco Neri, a lawyer of that city, and his wife Lucrezia Soldi. He received his early teaching from the friars at San Marco, the famous Dominican monastery in Florence. At sixteen Philip was sent to his uncle, Romolo, a merchant at San Germano, to assist him in his business, and with the hope that he might inherit his possessions. But in 1533 Philip went to Rome, where he acted as a private tutor, and was able to study under the Augustinians, and to begin those labours amongst the sick and poor which gained him in later life the title of "Apostle of Rome." His nights were spent in prayer and meditation in the churches of the city and in the catacombs. In 1538 he began his missionary work; somewhat in the manner of Socrates he traversed the city, seizing opportunities of entering into conversation with persons of all ranks, and of leading them on, with playful irony, questions and counsel, to consider the topics he desired to set before them.

In 1548 he founded the confraternity of the Santissima Trinità de' Pellegrini e de' Convalescenti, to minister to the thousands of poor pilgrims to Rome, and also to relieve the patients discharged from hospitals. In 1551 he was ordained priest. He settled, with some companions, at the hospital of San Girolamo della Carità, and while there tentatively began, in 1556, the institute with which his name is more especially connected, that of the Oratory. The scheme at first was for a series of evening meetings in a hall (the Oratory), at which there were prayers, hymns, readings from Scripture, from the fathers, and from the *Martyrology*, followed by a lecture, or by discussion of some religious question proposed for consideration. The musical selections (settings of scenes from sacred history) were called *oratorios*. In 1564 the Florentines invited Philip to take charge of their church in Rome, San Giovanni dei Fiorentini, then newly built. At this time the new society included amongst its members Caesar Baronius, the ecclesiastical historian, Francesco Maria Tarugi, afterwards archbishop of Avignon, and Paravicini, all three subsequently cardinals, and also Gallonius, author of a work on the *Sufferings of the Martyrs*, Ancina, Bordoni, and other men of ability and distinction.

The Florentines, however, built in 1574 a large oratory or mission-room for the society contiguous to San Giovanni. Eventually the society took the church of Santa Maria in Vallicella, in the middle of Rome. The building was pulled down, and a splendid church erected on the site. Neri then formally organized, under permission of a bull dated July 15, 1575, a community of secular priests, entitled the Congregation of the Oratory. The new church was consecrated early in 1577, but Neri himself did not migrate from San Girolamo till 1583, and then only in virtue of an injunction of the pope that he, as the superior, should reside at the chief house of his congregation. He was at first elected for a term of three years (as is usual in modern societies), but in 1587 was nominated superior for life. He desired that all congregations formed on his model outside Rome should be autonomous, a regulation formally confirmed by a brief of Gregory XV. in 1622. Neri's only interference in political matters was in 1593, when he induced Clement VIII., to withdraw the excommunication and anathema of Henry IV. of France. Neri administered the Oratory until his death (May 26, 1595) at Rome. He was succeeded by Baronius. Neri was beatified by Paul V. in 1600, and canonized by Gregory XV. in 1622.

NERNST, WALTER (1864–), German physical chemist, was born on June 25, 1864, at Briesen, West Prussia. He studied at the universities of Zürich, Berlin, Graz and Würzburg and became an assistant at the University of Leipzig, subsequently going in this capacity to Göttingen, where he later became a professor. In 1905 he was appointed ordinary professor of physics in the University of Berlin, and later became director of the Physikal. Techn. Reichsanstalt, Charlottenburg, a position he held until 1924. In 1925 he became director of the Physical Institute in the University of Berlin. On the technical side Nernst is known for the invention of an electric glow lamp which was more efficient although more complicated, than the old carbon lamps. In comparison with the modern metal filament lamps, however, the Nernst lamp has no general value, but in scientific work it is still used to a small extent as a concentrated source of light. In physical chemistry Nernst is responsible for a great deal of the fundamental work on reversible galvanic cells; he has also made considerable contributions to the theory of solutions, more especially in connection with diffusion, hydration and dissociation of electrolytes. With H. von Wartenberg he devised a method for measuring vapour densities at very high temperatures; they investigated the dissociation of various elements and compounds. Nernst is noted for the statement of the so-called third law of thermo-dynamics and for initiating important measurements of specific heats at low temperatures. In 1920 he received the Nobel Prize for physics.

He has edited the *Jahrbuch der Elektrochemie*, the *Zeitschrift für angewandte Chemie*, and the *Zeitschrift für Elektrochemie*. His *Experimental and Theoretical Applications of Thermodynamics to Chemistry* has appeared in a number of German and English editions. His new contribution to thermodynamics is described in *Die theoretischen und experimentellen Grundlagen des neuen Wärmesatzes* (1918); an English translation has been published.

NERO (NERO CLAUDIUS CAESAR AUGUSTUS GERMANICUS) (A.D. 37–68), Roman emperor 54–68, was born at Antium on Dec. 15, 37. He was the son of Gnaeus Domitius Ahenobarbus and Agrippina the younger, and his name was originally L. Domitius Ahenobarbus. His father died when Nero was scarcely three years old. In the previous year (39) his mother had been banished by order of her brother Caligula (Gaius), and Nero early found shelter in the house of his aunt Domitia. The emperor Claudius recalled Agrippina, who spent the next 13 years in a struggle to obtain the succession of the throne for Nero. She married Claudius in 49, and in 50 he adopted Nero as his son. Seneca was recalled from exile to be his tutor. On his fourteenth birthday he assumed the *toga virilis*, and was introduced to the Senate by Claudius with the title of *princeps iuventutis*. This made his succession almost certain, and Agrippina subsequently got rid of the partisans of Britannicus and installed Burrus as praefect of the praetorian guard.

Succession.—In 52, in Claudius' absence, Nero was praefect of the city. He married Claudius's daughter Octavia. On Oct. 13, 54 Claudius died, poisoned by Agrippina's orders and Nero was presented to the soldiers on guard as their new sovereign. From the palace steps he proceeded to the praetorian camp, and thence to the senate-house, where he was made emperor.

Agrippina's bold stroke has been completely successful. Only a few voices were raised for Britannicus; nor is there any doubt that Rome was prepared to welcome the new emperor with genuine enthusiasm. His prestige and his good qualities, carefully fostered by Seneca, made him popular, while his darker passions were as yet unsuspected. His first acts confirmed this favourable impression. He modestly declined the title of *pater patriae*; the memory of Claudius, and that of his own father Domitius were duly honoured. He promised to follow the principles of Augustus, and his clemency, liberality and affability were the talk of Rome.

Much of the credit of all this is due to Seneca and Burrus. Seneca had seen from the first that the real danger with Nero lay in the savage vehemence of his passions, and he made it his chief aim to stave off by every means in his power the dreaded outbreak. The policy of indulging his tastes and helping him to enjoy the sweets of popularity without the actual burdens of government succeeded for the time. During the first five years of his reign, little occurred to damp the popular enthusiasm. Nero's promises were

fulfilled, and the senate found itself free to discuss and even to decide important administrative questions. Abuses were remedied, the provincials protected from oppression, and the burdens of taxation lightened. On the frontiers no serious disaster occurred, and even the murder of Britannicus was accepted as a necessary measure of self-defence. But an essential part of Seneca's policy was to remove Nero from the influence of his mother.

Agrippina's Eclipse.—In 55, he found a powerful ally in Nero's passion for the beautiful freedwoman Acte, a passion which he deliberately encouraged. Agrippina's angry remonstrances served only to irritate Nero, and caresses equally failed. She then threatened to espouse the cause of Britannicus. Nero retaliated by poisoning Britannicus. Agrippina then tried to win over Nero's neglected wife Octavia, and to form a party of her own. Nero dismissed her guards, and placed her in a sort of honourable confinement (Tac. *Ann.* xiii. 12–20). During nearly three years she disappears from the history, and with her retirement things again for the time went smoothly. In 58 Nero was enslaved by Poppaea Sabina, a woman of a very different stamp from her predecessor. She was resolved to be Nero's wife, and her first object was the removal of Agrippina. By rousing Nero's jealousy and fear she induced him to seek her death, with the aid of a freedman Anicetus, praefect of the fleet of Misenum. Agrippina was invited to Baiae, and after an affectionate reception, was conducted on board a vessel so constructed as, at a given signal, to fall to pieces. But Agrippina saved herself by swimming, and wrote to her son, announcing her escape, and affecting entire ignorance of the plot. A body of soldiers under Anicetus then surrounded her villa, and murdered her in her own chamber. Nero was horrorstruck at the enormity of the crime and terrified at its possible consequences. But a six months' residence in Campania, and the congratulations which poured in upon him from the neighbouring towns, where the report had been officially spread that Agrippina had fallen a victim to her treacherous designs upon the emperor, gradually restored his courage. In Sept. 59 he re-entered Rome amid universal rejoicing. Races, exhibitions and games in the Greek fashion rapidly succeeded each other.

Poppaea.—The result of the death of Agrippina was the growing influence over Nero of Poppaea and her friends. In 62 Burrus died, it was said by poison, and Seneca retired from his post. Their place was filled by Poppaea, and the infamous Tigellinus, whose sympathy with Nero's sensual tastes had gained him the command of the praetorian guards in succession to Burrus. The fear of conspiracy was skilfully used by them to direct Nero's suspicions against possible opponents. Cornelius Sulla, who had been banished to Massilia in 58, was put to death on the ground that his residence in Gaul was likely to arouse disaffection in that province, and a similar charge proved fatal to Rubellius Plautus, who had for two years been living in retirement in Asia. Nero's taste for blood thus whetted, Octavia was divorced, banished to the island of Pandateria and murdered. Poppaea's triumph was now complete. She was married to Nero; her head appeared on the coins with his; and her statues were erected in the public places of Rome.

In the course of 61 occurred the rebellion of Boudicca (Boadicea) and the Iceni in Britain, resulting in the sack of Colchester and the destruction of the ninth legion before it was suppressed by Suetonius Paulinus. Further disasters were the destruction of Pompeii and the evacuation of Armenia in 63.

The Burning of Rome.—A far deeper and more lasting impression was produced by the great fire in Rome. The fire broke out on the night of July 18, 64, among the wooden booths at the south-east end of the Circus Maximus. Thence in one direction it rapidly spread over the Palatine and Velia up to the low cliffs of the Esquiline, and in another it laid waste the Aventine, the Forum Boarium and Velabrum till it reached the Tiber and the solid barrier of the Servian wall. After burning fiercely for six days it started afresh and desolated the regions of the Circus Flaminius and the Via Lata, and after it was finally quenched only four of the 14 *regiones* remained untouched; three had been utterly destroyed and seven reduced to ruins. The conflagration is said by all authorities later than Tacitus to have been deliberately caused by Nero himself. But Tacitus, though he mentions the rumours,

declares that its origin was uncertain, and in spite of such works as Profumo's *Le fonti ed i tempi dello incendio Neroniano* (1905), there is no proof of his guilt. By Nero's orders, the open spaces in the Campus Martius were utilized to give shelter to the homeless crowds, provisions were brought from Ostia and the price of corn lowered. In rebuilding the city every precaution was taken against the recurrence of such a calamity. Broad regular streets replaced the narrow winding alleys. The new houses were limited in height, built partly of hard stone and protected by open spaces.

This disaster undoubtedly told against Nero, being widely regarded as evidence of the wrath of the gods. The work of rebuilding included the erection of Nero's famous palace, the "golden house," and the laying-out of its wonderful grounds.

To defray the enormous cost, Italy and the provinces, says Tacitus, were ransacked, and in Asia and Achaia especially the rapacity of the imperial commissioners recalled the days of Mummius and of Sulla. It was the first occasion on which the provincials had suffered from Nero's rule, and the discontent it caused helped to weaken his hold over them at the very moment when the growing dissatisfaction in Rome was gathering to a head. Early in 65 Nero was panic-stricken by the discovery of a conspiracy involving such men as Faenius Rufus, Tigellinus's colleague in the prefecture of the praetorian guards, Plautius Lateranus, one of the consuls elect, the poet Lucan, and, lastly, not a few of the tribunes and centurions of the praetorian guard itself. Their chosen leader, whom they destined to succeed Nero, was C. Calpurnius Piso (q.v.), a handsome, wealthy and popular noble, and a boon companion of Nero. The plan to murder Nero was betrayed by a freedman Milichus. Piso, Faenius Rufus, Lucan and Seneca himself were executed.

In the next few months many more fell victims to his fear and resentment. Conspicuous among them was Paetus Thrasea, whose unbending virtue had long made him distasteful to Nero, and who was now suspected, possibly with reason, of sympathy with the conspirators. Poppaea died in the autumn of 65, and the general gloom was increased by a pestilence which followed the fire. Early in the summer of 66 the Parthian prince Tiridates came to Italy to receive the crown of Armenia at Nero's hands. It represented the final triumph of the arms and policy of Corbulo in the East, and at least a temporary solution of the Parthian problem.

Greece.—Towards the end of 66 Nero visited Greece with a retinue of soldiers, courtiers, musicians and dancers. The spectacle presented by Nero's visit was unique. He went professedly as an enthusiastic worshipper of Greek art and a humble candidate for the suffrages of Greek judges. At each of the great festivals, which to please him were for once crowded into a single year, he entered in regular form for the various competitions, scrupulously conformed to the tradition and rules of the arena, and awaited in nervous suspense the verdict of the umpires. The dexterous Greeks humoured him to the top of his bent. He planned and commenced the cutting of a canal through the Isthmus of Corinth.

Meanwhile the general dissatisfaction was coming to a head, as we may infer from the urgency with which the imperial freedman Helius insisted upon Nero's return to Italy. Revolt started in Gaul with the insurrection of Julius Vindex, governor of Gallia Lugdunensis. It is probable that the aims of Vindex included the liberation of northern Gaul, which would explain both the enthusiasm of the Gallic chiefs, and the opposition of the legions of the Rhine. This force defeated Vindex at Vesontio (Besançon) and offered the throne to their own commander Virginius Rufus, who refused it. Meanwhile the governors of Hispania, Tarraconensis and Galba and Otho, had rebelled, and Galba had claimed the throne. Nero returned from Greece to Naples for further revels.

Suicide.—The révolts in Spain and Germany terrified him too late into something like energy. The senate almost openly intrigued against him, and the populace were silent or hostile. The fidelity of the praetorian sentinels even was more than doubtful. When finally the palace guards forsook their posts, Nero despairingly stole out of Rome to seek shelter in a freedman's villa some four miles off. There he heard of the senate's proclamation of Galba as emperor, and of the sentence of death passed on him-

self. On the approach of the horsemen sent to drag him to execution, he collected sufficient courage to save himself by suicide. Nero died on June 9, 68, in the 31st year of his age and the fourteenth of his reign, and his remains were deposited by the faithful Acte in the family tomb of the Domitii on the Pincian hill. With his death ended the line of the Caesars, and Roman imperialism entered a new phase. His statues were broken, his name everywhere erased, and his "golden house" demolished.

The Roman populace for a long time revered his memory as that of an open-handed patron, and in Greece the recollections of his magnificence, and his enthusiasm for art, were still fresh when the traveller Pausanias visited the country a century later. The belief that he had not really died, but would return again to confound his foes, was long prevalent, not only in the remoter provinces, but even in Rome itself; and more than one pretender was able to collect a following by assuming the name of the last of the race of Augustus. More lasting still was the implacable hatred of those who had suffered from his cruelties. Roman literature, faithfully reflecting the sentiments of the aristocratic salons of the capital, while it almost canonized those who had been his victims, fully avenged their wrongs by painting Nero as a monster of wickedness. In Christian tradition he even appears as the mystic Antichrist, who was destined to come once again to trouble the saints. Even in the middle ages, Nero was still the very incarnation of splendid iniquity, while the belief lingered that he had only disappeared for a time, and as late as the 11th century his restless spirit was supposed to haunt the slopes of the Pincian hill.

The chief ancient authorities for Nero's life and reign are Tacitus (*Annals*, xiii.-xvii., edit. Furneaux), Suetonius, Dio Cassius (*Epit.* lxi., lxii., lxiii.) and Zonaras (*Ann.* xi.). The most important modern work is that of B. W. Henderson, *The Life and Principate of the Emperor Nero* (1903; see an important notice in *Class. Rev.* vol. xviii. p. 57), which contains full bibliography of ancient and modern writers; see also H. Schiller's *Nero*, and *Geschichte d. Kaiserzeit*; Lehmann, *Claudius und Nero*; Desider Kostolanyi, *Nero* (1928).

NERVA, MARCUS COCCEIUS (A.D. 735-98), Roman emperor from Sept. 18, 96 to Jan. 25, 98, was born at Narnia in Umbria on Nov. 8, probably in the year 35. He came of a senatorial family, his father and grandfather having been jurists.

He was praetor (66) and twice consul, in 71 with the emperor Vespasian for colleague and again in 90 with Domitian. Towards the close of the latter's reign (93) he is said to have been banished to Tarentum on a charge of conspiracy. On the murder of Domitian in September 96 Nerva was declared emperor by the people and the soldiers. He is described as a quiet, kindly, dignified man, honest of purpose, but unfitted by his advanced age to bear the weight of empire. Nevertheless, his selection, in spite of occasional exhibitions of weakness, justified the choice. The new emperor recalled those who had been exiled by Domitian; what remained of their confiscated property was restored to them, and a stop was put to the vexatious prosecutions which Domitian had encouraged. But the popular feeling demanded more than this. The reaction against the informers became as dangerous as the previous system. It was checked by Nerva, who was actuated by the taunt of Titus Catius Caesius Fronto that, "bad as it was to have an emperor who allowed no one to do anything, it was worse to have one who allowed everyone to do everything."

Nerva seems to have followed the custom of announcing the general lines of his future policy. He showed himself anxious to respect the traditional privileges of the senate, and such maxims of constitutional government as still survived. He pledged himself to put no senator to death. His councillors in all affairs of state were senators, and the hearing of claims against the *fiscus* was entrusted to a praetor and a court of *indices*.

The economical condition of Italy evidently excited his alarm and sympathy. The last mention of a *lex agraria* in Roman history is connected with his name. Under the provisions of this *lex*, large tracts of land were bought up and allotted to poor citizens. The cost was defrayed partly from the imperial treasury, but partly also from Nerva's private resources, and the execution of the scheme was entrusted to commissioners. He also founded or restored colonies at Verulae, Scyllacium and Sitifis in Mauretania. An entirely new departure was the main-

tenance at the public cost of the children of poor parents in the towns of Italy, which was combined ingeniously with the provision of loans for farmers. The treasury found the money, which was lent on the security of farms, and the farmers paid the interest to their municipality for the maintenance of poor children.

Private individuals were also encouraged to follow the imperial example. In the hands of Trajan, Hadrian and the Antonines, Nerva's example bore fruit in the institution of the *alimentationes*, the most genuinely charitable institution of the pagan world. These measures Nerva supplemented by others which aimed at lightening the financial burdens on the declining industry of Italy. The cost of maintaining the imperial postal system (*vehiculatio*) was transferred to the *fiscus*; from the same source apparently money was found for repairing the public roads and aqueducts; and lastly, the lucrative but unpopular tax of 5% on all legacies or inheritances (*vicesima hereditatum*), was so readjusted as to remove the grosser abuses connected with it. At the same time Nerva did his best to reduce the overgrown expenditure of the state. A commission was appointed to consider the best modes of retrenchment, and the outlay on shows and games was cut down to the lowest possible point. Early, apparently, in 97 he detected a conspiracy against his life headed by L. (or C.) Calpurnius Crassus, but he contented himself with a hint to the conspirators that their designs were known, and with banishing Crassus to Tarentum. The praetorian guards, at the instigation of one of their two prefects, Casperius Aelianus, whom Nerva had retained in office, imperiously demanded the execution of Domitian's murderers, the chamberlain Parthenius and Petronius Secundus, Aelianus's colleague. Nerva vainly strove to save, even at the risk of his own life, the men who had raised him to power, but the soldiers brutally murdered the unfortunate men, and forced him to propose a vote of thanks for the deed. This humiliation convinced Nerva of the necessity of placing the government in stronger hands than his own. He resolved to adopt as his colleague and destined successor, M. Ulpius Trajanus, a distinguished soldier, at the time in command of the legions on the Rhine. In Oct. 97, in the temple of Jupiter on the Capitol, Trajan was formally adopted as his son and declared his colleague in the government of the empire. For three months Nerva ruled jointly with Trajan, but on Jan. 25, 98, he died somewhat suddenly. He was buried in the sepulchre of Augustus, and divine honours were paid him by his successor. The verdict of history upon his reign is best expressed in his own words—"I have done nothing which should prevent me from laying down my power, and living in safety as a private man." The memory of Nerva is still preserved by the ruined temple in the Via Alessandrina (il Colonnacce) which marks the site of the Forum begun by Domitian, but which Nerva completed and dedicated.

NERVAL, GÉRARD DE (1808-1855), the adopted name of Gérard Labrunie, French man of letters, born in Paris on May 22, 1808. His father was an army doctor, and the child was left with an uncle in the country, while Mme. Labrunie accompanied her husband in his campaigns. She died in Silesia. In 1811 his father returned, and beside Greek and Latin taught the boy modern languages and the elements of Arabic and Persian. Gérard found his favourite reading in old books on mysticism and the occult sciences. His first work, *La France guerrière, élégies nationales*, was published while he was still a schoolboy at the Collège Charlemagne. In 1828 he published a translation of Goethe's *Faust*, the choruses of which were afterwards used by Berlioz for his legend-symphony, *The Damnation of Faust*. A number of poetical pieces and three comedies combined to acquire for him, at the age of 21, a considerable reputation, and led to his association with Théophile Gautier in the preparation of the dramatic

feuilleton for the *Presse*. He conceived a violent passion for the actress Jennie Colon, in whom he thought he recognized a certain Adrienne, who had fired his childish imagination. Her marriage and her death in 1842 were blows from which his nervous temperament never really recovered. He travelled in Germany with Alexandre Dumas, and alone in various parts of Europe, leading a very irregular and eccentric life. In 1843 he visited Constantinople and Syria, where, among other adventures, he nearly married the daughter of a Druse sheikh. He contributed accounts of his travels to the *Revue des Deux Mondes* and other periodicals. After his return to Paris in 1844 he resumed for a short time his *feuilleton* for the *Presse*, but his eccentricities increased and he committed suicide by hanging, on Jan. 25, 1855. The literary style of Gérard is simple and unaffected, and he has a peculiar faculty of giving to his imaginative creations an air of naturalness and reality. In a series of novelettes, afterwards published under the name of *Les Illuminés, ou les précurseurs du socialisme* (1852), containing studies on Rétif de la Bretonne, Cagliostro and others, he gave a sort of analysis of the feelings which followed his third attack of insanity. Among his other works the principal are *Les Filles du feu* (1854), which contains his masterpiece, the semi-autobiographical romance of *Sylvia; Scènes de la vie orientale* (1848-50); *Contes et facéties* (1852); *La Bohème galante* (1856); and *L'Alchimiste*, a drama in five acts, the joint composition of Gérard and Alexandre Dumas. His *Poésies complètes* were published in 1877.

See the notices by Théophile Gautier and Arsène Houssaye, prefixed to the posthumous *Le Rêve et la vie* (1855); Maurice Tourneux's sketch in his *Âge du romantisme* (1887); and a sympathetic study of temperament in the *Névroses* (1898) of Mme. Arvède Barine. See also G. Ferrières, *Gérard de Nerval* (1906).

NERVE, originally a sinew or tendon (*cf.* "strain every nerve") but now used for the conducting fibres of the nervous system in anatomy and secondarily as a psychical term for courage or firmness and in "nervousness" for the opposite quality. Here the anatomy of the nerves is dealt with; see also NERVOUS SYSTEM, MUSCLE AND NERVE, NEUROPATHOLOGY, etc.

CRANIAL

The 12 pairs of cranial nerves rise directly from the brain. With one exception they all contain medullated fibres (see NERVOUS SYSTEM). The following is a list:—

(1) Olfactory; (2) Optic; (3) Oculo-motor or Motor oculi; (4) Trochlearis or Patheticus; (5) Trigeminal or Trifacial; (6) Abducens; (7) Facial; (8) Auditory; (9) Glosso-pharyngeal; (10) Vagus or Pneumogastric; (11) Spinal accessory; (12) Hypoglossal.

Olfactory.—The first, or olfactory nerve, consists of the *olfactory bulb and tract*, which are a modified lobe of the brain and lie beneath the sulcus rectus on the frontal lobe of the brain (fig. 1). At its posterior end the tract becomes continuous with the brain; anteriorly is the bulb from which some twenty small non-medullated nerves pass through the cribriform plate of the ethmoid to supply the sensory organs in the olfactory mucous membrane (see OLFATORY SYSTEM).

Optic.—The second or optic nerve consists of the *optic tract*, the *optic commissure or chiasma*, and the *optic nerve proper*. The optic tract begins at the lower visual centres or internal and external geniculate bodies, the superior quadrigeminal body and the pulvinar (fig. 1), but these again are connected with the higher visual centre in the occipital lobe by the optic radiations (fig. 2). In the chiasma some of the fibres cross and some do not, so that the right optic tract forms the right half of both the right and left optic nerves. In addition, the fibres from the internal geniculate body of one side cross in the chiasma to the same body of the opposite side, forming *Gudden's commissure*. The optic nerve passes through the optic foramen into the orbit, where it is penetrated by the central artery of the retina, and pierces the sclerotic internal to the posterior pole of the eyeball. See EYE.

Oculomotor.—The third or oculomotor nerve rises from a nucleus in the floor of the aqueduct of Sylvius and comes to the surface on the inner side of the crus cerebri (fig. 1), pierces the dura mater, and lies in the outer wall of the cavernous sinus,

FROM D. J. CUNNINGHAM, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 1.—VIEW OF INFERIOR SURFACE OF BRAIN, WITH LOWER PORTION OF THE TEMPORAL AND OCCIPITAL LOBES: THE CEREBELLUM ON THE LEFT SIDE IS REMOVED TO SHOW ORIGINS OF THE CEREBRAL NERVES

where it divides into an upper and lower branch. Both these enter the orbit through the sphenoidal fissure, the upper branch supplying the superior rectus and levator palpebrae superioris muscles, the lower the inferior and internal rectus and the inferior oblique, thus supplying five of the seven orbital muscles.

Trochlear.—The fourth or trochlear nerve is very small, and comes from a nucleus a little lower than that of the third nerve. It crosses to the opposite side in the fourth ventricle, winds round the outer side of the crus cerebri (fig. 1) and enters the outer wall of the cavernous sinus to reach the orbit through the sphenoidal fissure. Here it enters the superior oblique muscle on its orbital surface.

Trigeminal.—The fifth or trigeminal nerve consists of motor and sensory roots. The motor root rises from a nucleus in the upper lateral part of the floor of the fourth ventricle, and by a descending (mesencephalic) tract near the Sylvian aqueduct (fig. 3). The large sensory root goes to a sensory nucleus a little external to the motor one, and also, by a spinal or descending root, to the substantia gelatinosa Rolandi as low as the second spinal nerve (fig. 3). The superficial origin of the fifth nerve is from the side of the pons (fig. 1), and the two roots at once pass into a small compartment of the dura mater, where the large crescentic *Gasserian ganglion* is formed upon the sensory root, and from this the three branches, ophthalmic, maxillary, mandibular, come off. The motor root only joins the mandibular branch. The *ophthalmic division* runs in the outer wall of the cavernous sinus, where it divides into frontal, lachrymal and nasal branches. They all enter the orbit through the sphenoidal fissure. The *maxillary division* leaves the skull through the foramen rotundum, and then runs across the roof of the sphenomaxillary fossa; here the *sphenomaxillary* or *Mecke's ganglion* hangs from it by two roots. The nerve then runs in the floor of the orbit, giving off *superior dental* branches, until it emerges on to the face at the infraorbital foramen, where it divides into *palpebral*, *nasal* and *labial branches*. The *mandibular division* leaves the skull through the foramen ovale, and at once gives off motor branches for the muscles of mastication; these are derived from the motor root of the fifth, except that for the buccinator, which really supplies only the skin and

mucous membrane in contact with the muscle. After the motor branch is given off, the nerve divides into *lingual*, *inferior dental* and *auriculo-temporal*. The lingual is joined by the *chorda tympani* branch of the facial nerve.

Abducent.—The sixth or abducent nerve rises from a nucleus in the floor of the fourth ventricle deep to the eminentia terebrales (fig. 3). It appears on the surface of the brain just below the pons and close to the middle line (fig. 1), pierces the dura mater and runs in the floor of the cavernous sinus to the sphenoidal fissure. Entering the orbit it supplies the external rectus muscle.

Facial.—The seventh or facial nerve begins in a nucleus which is about the same level as that for the sixth, but much deeper from the floor of the fourth ventricle as well as farther from the middle line (fig. 3). The fibres of the facial loop round the nucleus of the sixth, and then emerge in the triangular interval between the medulla, pons and cerebellum, close to the eighth nerve (fig. 1). Entering the internal auditory meatus the facial nerve passes into a canal in the petrous bone (*aqueductus Fallopii*), emerges at the stylo-mastoid foramen on the base of the skull, and enters the parotid gland, in which it forms a plexus called the *ples anserinus*. From this, branches pass to all the muscles of the face except those of mastication.

Auditory.—The eighth or auditory nerve is in two bundles, *cochlear* and *vestibular*. The former comes from the cochlear nuclei which lie deep to the acoustic tubercle in the floor of the fourth ventricle (fig. 3); the latter rises from the dorsal nucleus, nucleus of Deiters and the nucleus of the descending root, which are more deeply placed. The *nucleus of Deiters* is connected with the cerebellum, and is concerned in maintaining the equilibrium (*q.v.*) of the body; the cochlear nuclei are connected with the inferior quadrigeminal body by the lateral fillet as well as with the internal geniculate body, and thus with the higher auditory centre in the temporo-sphenoidal lobe by the auditory radiations. The vestibular root passes in front of the restiform body (fig. 3), and the cochlear behind that body. Together they enter the internal auditory meatus, pierce the lamina cribrosa, the vestibular nerve supplying the utricle and superior and external semicircular canals, the cochlear nerve, the posterior canal, the saccule

SPINAL

The spinal nerves arise from each side of the spinal cord and are distributed to the trunk and limbs, though some of the upper ones supply the lower parts of the head and face. There are generally thirty-one pairs, eight cervical (abbreviated C.), twelve thoracic (Th.)—formerly called dorsal,—five lumbar (L.), five sacral (S.) and one coccygeal (Coc.). As the thoracic nerves are

FROM A. M. PATERSON, IN "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 4.—THE DISTRIBUTION OF THE 10TH (PNEUMOGASTRIC OR VAGUS) NERVE

the simplest and most generalized in their arrangement, a typical one of these, say the fourth or fifth, will be first described.

The nerve is attached to the spinal cord by two roots, of which the ventral is purely efferent or motor and the dorsal purely afferent or sensory. On the dorsal root is a fusiform ganglion which lies in the foramen between the vertebrae through which the nerve passes. The two roots then join together to form a mixed nerve (fig. 5), but very soon divide once more into anterior (ventral) and posterior (dorsal) primary divisions. These, however, each contain sensory and motor fibres. Just before it divides in this way the mixed nerve gives and receives its rami communicantes with the sympathetic (see NERVOUS SYSTEM).

The anterior primary division runs round the trunk, between the ribs, forming an intercostal nerve and giving off a lateral cutaneous branch, when the side of the body is reached, which divides into anterior and posterior secondary branches. The rest of the division runs forward, supplying the intercostal muscles,

as far as the edge of the sternum, when it ends in an anterior cutaneous branch to the front of the chest. The dorsal primary division divides into an external (lateral) and internal (mesial) branch through which the skin and muscles of the back are supplied.

It will be seen from the foregoing that the thoracic nerves are almost completely segmental in their distribution, in other words, each supplies a slice of the body, but in the other regions this segmental character is masked by the development of the branchial skeleton and the limbs. In the cervical region the first cervical or *suboccipital* nerve comes out between the occiput and atlas and does not always have a posterior root. When it has not, it obviously can supply no skin. Its anterior primary division joins those of the second, third and fourth cervical nerves to form the *cervical plexus*, from which the skin of the side of the neck and lower part of the head and face are supplied by means of the *small occipital*, *great auricular*, *superficial cervical*, *suprasternal*, *supraclavicular* and *supraacromial* nerves (fig. 7), as well as those muscles of the neck which are not supplied by the cranial nerves. The *phrenic* nerve, which comes chiefly from the fourth cervical, runs down, through the thorax, to supply the greater part of the diaphragm. The explanation of this long course (see DIAPHRAGM) is that the diaphragm is formed in the neck region of the embryo. The posterior primary division of the second cervical nerve is large, and its inner (mesial) branch (*great occipital*) supplies most of the back of the scalp (fig. 7). The fifth, sixth, seventh and eighth anterior primary divisions of the cervical nerves as well as a large part of that of the first thoracic are prolonged into the arm, and in the lower part of the neck and armpit communicate with one another to form the *brachial plexus*. It will be seen from fig. 8 that each component nerve except the first thoracic divides into an anterior (ventral) and a posterior (dorsal) division which are best spoken of as secondary divisions in order to prevent confusion with the anterior and posterior

FROM A. M. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 5.—SCHEME OF THE DISTRIBUTION OF A TYPICAL SPINAL NERVE

primary divisions which all the spinal nerves undergo. In the diagram the anterior secondary divisions are white, while the posterior are shaded. Later on in the plexus three cords are formed of which the posterior is altogether made up of the posterior secondary divisions, while the anterior secondary divisions of the fifth, sixth and seventh cervical nerves form the external cord, and those of the eighth cervical and first thoracic the inner. As a general rule the nerves which rise from the ventral secondary divisions of the limb plexuses run only to that surface of the limb which was ventral in the embryo, while the

dorsal secondary divisions are confined to the original dorsal area, but, in order to apply this to the human adult, it must be realized that the limbs are at one time flattened buds coming off at right angles from the side of the body and having dorsal and ventral surfaces, one (preaxial) border toward the head of the embryo, and one (postaxial) toward the tail.

Brachial Plexus.—With regard to the muscular supply of a limb the general rule is that each muscle is supplied by fibres

from the *lesser internal cutaneous* (Th. 1) which often joins the *intercosto-humeral* or lateral cutaneous branch of the second intercostal nerve to supply the skin on the inner side of the upper arm, and the *internal anterior thoracic nerve* (C. 8, Th. 1) to the pectoralis minor and major.

From the posterior cord are derived the three *subscapular nerves* (C. 5, 6, 7, 8) which supply the subscapularis, teres major and latissimus dorsi muscles, the *circumflex nerve* (C. 5, 6) supplying the deltoid and teres minor muscles, and the skin over the lower part of the deltoid, and the *musculo-spiral nerve* (C. 5, 6, 7, 8) which is the largest branch of the brachial plexus and gives off cutaneous twigs to the outer side and back of the arm and to the back of the forearm, as well as muscular twigs to the triceps and adjacent muscles. At the elbow this nerve divides into the *radial* and *posterior interosseous*. The radial is entirely sensory and supplies the skin of the outer side of the back of the hand, including three digits and a half, while the posterior interosseous is wholly muscular, supplying the muscles on the back of the forearm. It will be seen that the posterior cord is derived altogether from posterior secondary divisions of the plexus, but there are three other nerves derived from these which should be mentioned.

The *posterior thoracic* or respiratory nerve of Bell comes off the back of the fifth, sixth and seventh cervical nerves before the anterior and posterior secondary divisions separate, and runs down to supply the serratus magnus muscle.

The *posterior scapular* or nerve to the rhomboid muscles runs to those muscles from the fifth cervical.

The *suprascapular nerve* (C. 5, 6) passes through the suprascapular notch to supply the supraspinatus and infraspinatus muscles.

Lumbo-Sacral Plexus.—The spinal nerves which are distributed to the lower limbs first intercommunicate in the lumbar and sacral plexuses, which, with the perineal nerves, are sometimes spoken of together as the lumbo-sacral plexus. The *lumbar plexus* (fig. 9) is formed as a rule of the first four lumbar nerves, though the greater part of the first lumbar is segmental in its distribution and resembles one of the thoracic nerves. It early divides into an *ilio-hypogastric* and *ilio-inguinal* branch, which run round the abdominal wall in the substance of the muscles, and of which the former gives off an iliac branch, which is in

FROM A. N. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 6.—DISTRIBUTION OF THE CUTANEOUS NERVES ON THE FRONT OF THE TRUNK, SHOWING, ON THE LEFT SIDE OF THE FIGURE, THE DISTRIBUTION OF THE SEVERAL NERVES

derived from more than one spinal nerve; this is made possible by the redistribution of fibres in the plexuses. Moreover, the muscular supply does not necessarily correspond to that of the overlying skin, because (see MUSCULAR SYSTEM) some of the primitive muscles have been suppressed, others have fused together, while others have shifted their position to a considerable distance. Bearing the foregoing facts in mind, the main distribution of the nerves of the brachial plexus may be surveyed. The outer cord of the plexus gives off the *external anterior thoracic nerve* (C. 5, 6, 7) to the pectoralis major, the *musculo-cutaneous nerve* (C. 5, 6) to the muscles on the front of the arm, and to the skin of the outer side of the forearm and the outer head of the *median nerve* (C. 5, 6, 7), which joins the inner head (C. 8, Th. 1) and supplies most of the flexor muscles of the front of the forearm as well as those of the ball of the thumb.

From the inner cord come the inner head of the median just mentioned, the *ulnar nerve* (C. 8, Th. 1), which passes down behind the internal condyle of the humerus, where it is popularly known as the "funny bone" and supplies the flexor carpi ulnaris, half the flexor profundus digitorum, and most of the muscles of the hand as well as the inner digit and a half on the palmar and dorsal aspects. Other branches of the inner cord are the *internal cutaneous* (C. 8, Th. 1) supplying the inner side of the forearm,

FROM A. N. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 7.—THE TRIANGLES OF THE NECK, SHOWING THE NERVES

series with the lateral cutaneous branches of the intercostal nerves and passes over the crest of the ilium to the gluteal region, while the hypogastric branch runs round to the skin of the pubic region.

The other anterior secondary division of the lumbar plexus is the obturator (fig. 9). The *obturator nerve* (L. 2, 3, 4) supplies the adductor group of muscles on the inner side of the thigh as well as the hip and knee joints; it occasionally has a cutaneous branch on the inner side of the thigh. The posterior secondary branches of the plexus are the *genito-crural*, the *external cutaneous* and the *anterior crural*. The *genito-crural nerve* (L. 1, 2)

FROM A. M. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 8.—THE NERVES OF THE BRACHIAL PLEXUS

is partly anterior (ventral) and partly posterior (dorsal). It sends one anterior branch through the inguinal canal to supply the cremaster muscle, and another (posterior) to the skin of the thigh just below the groin.

The *external cutaneous nerve* (L.2, 3) supplies the skin of the outer side of the thigh, while the *anterior crural* (L.2, 3, 4) innervates the muscles on the front of the thigh, the skin on the front and inner side of the thigh, through its *middle* and *internal cutaneous* branches, and the skin of the inner side of the leg and foot through the *internal saphenous* branch. At first sight it is difficult to understand how the anterior crural nerve, which supplies the skin of the front of the thigh, is a posterior secondary division of the lumbar plexus, but the explanation is that the front of the human thigh was originally the dorsal surface of the limb bud, and the distribution of the nerve is quite easily understood if the position of the hind limb of a lizard or crocodile is glanced at. The fourth lumbar nerve is sometimes called the *nervus furcalis*, because, dividing, it partly goes to the lumbar, and partly to the sacral plexus (fig. 9), though, when the plexus is prefixed, the third lumbar may be the *nervus furcalis*, or, when it is postfixed, the fifth lumbar.

All the constituent nerves of the plexus run into one huge nerve, the *great sciatic*, which runs down the back of the thigh and, before reaching the knee, divides into *external* and *internal popliteal* nerves. These two nerves are sometimes separate from their first formation in the plexus, and may always be separated easily by the handle of a scalpel, since they are only bound together by loose connective tissue to form the great sciatic nerve. When they are separated in this way it is seen that the external popliteal is made up entirely of posterior (dorsal) secondary divisions (fig. 9), and is derived from the fourth and fifth lumbar and first and second sacral nerves, while the internal popliteal is formed by the anterior (ventral) secondary divisions of the fourth and fifth lumbar and first, second and third sacral nerves. The *external popliteal nerve* supplies the short head of the biceps femoris (see MUSCULAR SYSTEM), and, just below the knee, divides into anterior tibial and musculo-cutaneous branches, which both supply the dorsal surface of the leg and foot. The *anterior tibial nerve* is chiefly muscular, innervating the muscles in front of the tibia and fibula as well as the extensor brevis digitorum pedis on the dorsum of the foot, though it gives one small cutaneous branch to the cleft between the first and second toes. The *musculo-cutaneous nerve* supplies the peroneus longus and brevis muscles, and the rest of the skin of the dorsum of the foot and lower part of the leg, while the skin of the upper part of the dorsum of the leg, below the knee, is supplied by the external popliteal before its

division. The *internal popliteal nerve*, after supplying the hamstrings, is continued into the calf of the leg as the *posterior tibial* and innervates all the muscles on this, the ventral, surface. Behind the inner ankle it divides into the *external* and *internal*

FROM "GRAY'S ANATOMY" (LONGMANS, GREEN & CO.)

FIG. 9.—PLAN OF THE LUMBAR AND SACRAL PLEXUSES

plantar nerves, from which the muscles and skin of the sole are supplied. A little above the knee each popliteal nerve gives off a contribution to help form the *external* or *short saphenous nerve*. These join about the middle of the back of the calf, and the, now

formed, *short saphenous nerve* runs down behind the outer ankle to supply the outer side of the foot. Sometimes it encroaches on the dorsum of the foot, replacing part of the musculo-cutaneous. To return to the sacral plexus: branches are given off from the anterior secondary divisions to the short external rotator muscles of the hip (pyriformis, quadratus femoris, etc.), while from the posterior secondary divisions come the superior gluteal (L. 5, S. 1) and the inferior gluteal (L. 5, S. 1, 2) to the muscles of the buttocks.

In modern descriptions the lower branches of the lumbo-sacral plexus are grouped into a *puddendal plexus*, and the plan, though open to criticism on morphological grounds, has such descriptive advantages that it is followed here. Contributions from the first, second, third and fourth sacral, and the coccygeal nerve, form it, and these contributions are almost all anterior (ventral) secondary divisions. The branches of this plexus are the small sciatic, pudic, visceral, perforating cutaneous, muscular and sacro-coccygeal nerves. The *small sciatic* (S.1, 2, 3) is partly dorsal and partly ventral in its origin and distribution; it supplies the skin of the perineum, buttock and the back of the thigh. The *pudic nerve* (S.2, 3, 4) helps to supply the skin and muscles of the perineum and genital organs. The *visceral branches* form the pelvic stream of white rami communicantes (see NERVOUS SYSTEM); they run from the second and third or third and fourth sacral nerves to the pelvic plexuses of the sympathetic system. The *perforating cutaneous nerve* (S.2, 3) pierces the great sacro-sciatic ligament and supplies the skin over the lower internal part of the buttock. The *muscular branches* (S.3, 4) supply the external sphincter, levator ani and coccygeus.

The *sacro-coccygeal nerve* (S.4, 5; Coc.1) runs down on each side of the coccyx to supply the adjacent skin, and represents the ventro-lateral nerve of the tail of lower mammals.

(F. G. P.; X.)

The function of the nerves is to transmit messages from the sense organs to the central nervous system and from the central nervous system to the muscles and gland cells. The incoming (or "afferent") messages are decoded, so to speak, in the spinal cord and brain and the outgoing ("efferent") messages are elaborated there, the nerves acting merely as the conducting mechanism between the periphery and the central controlling station. A nerve appears to the naked eye as a long cord of whitish, translucent

FIG. 10.—A PERIPHERAL NERVE AND ITS FIBRES. B. STRUCTURE OF NERVE FIBRE

material; the large nerve trunks like the sciatic (in man) may be half an inch in breadth, but the ultimate branches are so thin as to be scarcely visible. Microscopically the nerve is made up of a number of fibres, about $\frac{1}{100}$ mm. in diameter, each of which acts as an independent conducting path: so that a nerve of medium size may contain several thousand fibres, some terminating in sense organs and some in muscles or glands.

The nerve fibre itself is made of a central core or "axis cylinder" of protoplasm arising from the body of a nerve cell which is generally stationed in or near the spinal cord: the axis cylinder

runs from one end of the fibre to the other enclosed in a sheath of fatty material (myelin) interrupted by occasional constrictions or "nodes" and this in turn is enclosed in a membranous sheath called the neurilemma. Either or both sheaths may be absent in certain fibres. A diagram of the general structure of the nerve and its fibres is shown in fig. 10.

The impulse set up by an electric shock in an isolated nerve might have little connection with the normal working of the

FIG. 11.—ELECTRIC RESPONSE OF NERVE
A. Record of "action current" in a frog's sciatic nerve, stimulated electrically. B. Action of currents in sensory nerve fibres, by light touch

nerve in the body, but there is now no doubt that the messages normally conveyed by the nerve fibres do consist of these impulses and of nothing else. To show this it is necessary to magnify the electric changes in the nerve trunk several thousand times by valve amplification; it is then possible to record the discharge of impulses travelling towards the central nervous system from the sense organs or away from it to the muscles. A portion of such a record is given in fig. 11. A sense organ has been stimulated by touching the skin and a series of impulses passes up the sensory fibres. Each impulse has the usual brief action current and all are of the same size whatever the strength of the stimulus. This does not prevent the nerve fibre from signalling the intensity of stimulation, for it is found that the frequency of the discharge (the number of impulses per second) depends on the stimulus, and the frequency may vary over a wide range (from 5 to 150 a second in the frog).

The impulses from the different sense organs are not all exactly alike, for their rate of travel depends on the size of the fibre and the fibres from different organs are not all of the same diameter; but all impulses whether motor or sensory seem to be of the same type and up to the present we have no evidence of any other kind of nervous conduction. (E. D. A.)

NERVI, a coast town of Liguria, Italy, province of Genoa, 7½ m. S.E. of Genoa by rail (also electric tramway), 82 ft. above sea-level. Pop. (1921), 7,994. It is much frequented as a winter resort. It is surrounded with groves of olives, oranges and lemons, and its villas have beautiful gardens. At Quarto, 2½ m. N.W., 1,000 Garibaldians embarked for Marsala in 1860.

NERVOUS SYSTEM. The nervous system forms an extremely complicated set of links between different parts of the body, and is divided into (A) the central nervous system, composed of (1) the brain, and (2) spinal cord; (B) the peripheral nervous system, consisting of (1) the cranial nerves, (2) the spinal nerves, (3) the various sense organs, such as the eye, ear, olfactory organ, taste organ and tactile organs, and (4) the motor end plates; (C) the sympathetic system. The anatomy and physiology of many of these parts are treated in separate articles (see BRAIN; SPINAL CORD; NERVE; EYE; EAR; OLFACTORY SYSTEM; TASTE; TOUCH; MUSCLE AND NERVE; and also SYMPATHETIC SYSTEM). The object here is to deal with anatomical points which are common to the whole system, or for which a place does not conveniently occur elsewhere.

HISTOLOGY OF THE NERVOUS SYSTEM

Three kinds of tissue are found in the nervous system, *nerve fibres*, *nerve cells* and a supporting tissue called *neuroglia*.

Nerve Fibres may be medullated or non-medullated, but, whichever they are, they consist of the long process or *axon* of a nerve cell; in a non-medullated nerve this process is either naked or enclosed in a delicate membrane called the *primitive sheath* or *neurilemma*, but in a medullated nerve the process or *axis cylinder* is encased by a white fatty substance called *myelin*, and so the term "myelinated" is often used instead of "medullated" for these nerves (fig. 1). Outside this white sheath the neurilemma is present in most nerves, but is lost when they are massed to form

the white matter of the central nervous system and in the optic nerve. At regular intervals the myelin is interrupted by some substance which stains deeply with silver nitrate, and these breaks are known as *nodes of Ranvier*. They do not, however, affect the axis cylinder. In a large nerve, e.g., the median, the nerve fibres are collected into small bundles (*funiculi*), enclosed in a connective tissue sheath (*perineurium*), and separated from it by a lymph space. From this sheath delicate processes penetrate among the fibres (*endometrium*). The funiculi are collected into bundles called *fasciculi*, and the whole nerve consists of a variable number of fasciculi surrounded by a dense fibrous sheath, the *epineurium*.

FIG. 1.—STRUCTURE OF A SINGLE NERVE FILAMENT

and are best studied in the anterior horns of the grey matter of the latter, where they are nearly visible to the naked eye (fig. 2).

Neuroglia.—This is the delicate connective tissue which supports and binds together the nervous elements of the central nervous system. One part of it, which lines the central canal of the cord and ventricles of the brain, is formed of columnar cells (*ependyma*), while the rests consists of small cells with numerous processes which sometimes branch and sometimes do not.

Nerve Endings.—Sensory nerves end by breaking up into fibrillae or by various tactile organs. In the former case the minute fibrils composing the axons or nerve fibres separate and end among epithelial cells of the mucous membrane or skin. In the latter case the nerve fibres lose their myelin sheath and end in one of the seven following organs:—

1. *End bulbs of Krause* (see fig. 3), oval bulbs composed of elongated cells among which the nerve fibrils end in knobs or coils; each is surrounded by a sheath of neurilemma, and the organs are found in the lips, tongue, conjunctiva, epineurium of nerves, synovial membranes of joints, and in the glans penis et clitoridis, where they have a mulberry-like appearance.

2. *Pacimian corpuscles* (fig. 3) are large enough to be seen by the naked eye, and are oval bodies made up of a series of concentric capsules of connective tissue rather resembling the structure of an onion; in the centre is a structureless core, at the distal extremity of which the nerve fibre ends in one or more knobs. These bodies are found in the palm and sole, in the mesentery, the genital organs and in joints.

3. *Tactile corpuscles of Meissner and Wagner* (fig. 3) are oval

bodies found in certain of the skin papillae and mucous membrane, especially of very sensitive parts like the hand and foot, lips, tongue and nipple. They are oval and made of a connective tissue capsule from which septa enter the interior. The nerve fibre generally takes a spiral course through them, loses its myelin sheath, and ends by breaking up into its fibrils, which eventually become bulbous.

FROM R. HOWDEN, IN "CUNNINGHAM'S TEXTBOOK OF ANATOMY"

FIG. 3.—TACTILE CORPUSCLES

4. *Tactile corpuscles of Grandry* are found in the skin of those parts devoid of hair, and consist of a capsule containing two or more largish cells, between which the nerve fibre ends in the so-called tactile discs.

5. *Ruffini's endings* are flattened oval bodies with a thick connective tissue capsule, in which the nerve fibre divides into many varicose branches, form a rich plexus, and end in knobs. They are found between the true skin and subcutaneous tissues of the fingers.

6. *Organs of Golgi* occur in tendons. Nerve fibres penetrate the tendon bundles and divide in a tree-like manner to end in little disks and varicosities.

7. *Neuro-muscular spinules* are small fusiform bundles of embryonic muscle fibres, among which the nerve fibres end by encircling them and forming flattened disks. These are sensory endings, and must not be confused with the motor end plates.

Motor nerves end in striped muscle by *motor end plates*. These are formed by a nerve fibre approaching a muscle fibre and suddenly losing its myelin sheath while its neurilemma becomes continuous with the sarcolemma of the muscle fibre. The axis cylinder divides, and its ramifications are surrounded by a disk of granular matter containing many clear nuclei.

THE SYMPATHETIC SYSTEM

This system is made up of two gangliated cords running down one on each side of the vertebral column and ending below in the median coccygeal ganglion. In the neck the cords lie in front of the anterior tubercles of the transverse processes of the cervical vertebrae, in the thorax, in front of the heads of the ribs, while in the abdomen they lie in front of the sides of the bodies of the vertebrae. In addition to these cords there are numerous ganglia and plexuses through which the sympathetic nerves pass on their way to or from the viscera and blood-vessels.

A typical ganglion of the sympathetic chain is connected with its corresponding spinal nerve by two branches called *rami communicantes*, one of which is grey and the other white (fig. 4). The white consists of medullated fibres belonging to the central nervous system, and these are splanchnic afferent or centripetal, and efferent or centrifugal. The efferent fibres lie in the anterior roots of the spinal nerves, and, like all the fibres there, are either motor or secretory. They are the motor paths for the unstriped muscle of the vessels and viscera, and the secretory paths for the cells of the viscera. In the course of each fibre from the nerve cell in the spinal cord, of which it is an axon, to the vessel or viscus it supplies, there is always a break where it arborizes round a ganglion cell, and this may be in its own ganglion of the sympathetic chain, in a neighbouring ganglion above or below, or in one of the so-called collateral ganglia interposed between the sympathetic chain and the viscera.

The grey rami communicantes are found in connection with all the spinal nerves, though they are irregular in the paths by which they reach the sympathetic ganglia from the cells of which they spring; their fibres are mainly non-medullated, and pass into both roots of the spinal nerves and also into the anterior and posterior primary divisions of those nerves. In this way they reach the body wall and limbs, and are somatic vaso-motor, secretory and pilo-motor fibres, supplying the vessels, glands and hair muscles of the

FIG. 2.—NERVE CELLS FROM THE ANTERIOR HORN OF GREY MATTER OF THE HUMAN SPINAL CORD

skin and its glands.

In the gangliated chain there is a ganglion corresponding to nearly each spinal nerve, except in the neck, where only three are found; of these the superior cervical ganglion is more than an inch long, and is connected with the first four spinal nerves as well as with the ninth, tenth and twelfth cranial nerves (fig. 5). Branches of distribution pass from it to the pharyngeal plexus,

FROM A. M. PATERSON, "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG. 4.—SCHEME OF THE CONSTITUTION AND CONNECTIONS OF THE GANGLIATED CORD OF THE SYMPATHETIC

the heart and the two carotid arteries. Of these the branch accompanying the internal carotid artery passes to the carotid and cavernous plexuses, and through these communicates with the sphenomaxillary, otic and ciliary ganglia, while the branch to the external carotid communicates with the submaxillary ganglion. The middle cervical ganglion (fig. 5), when it is present, gives rami communicantes to the fifth and sixth cervical nerves, as well as branches of distribution to the thyroid body and heart.

The inferior cervical ganglion (fig. 5) lies behind the subclavian artery, and, besides the main connective cord, has a loop (ansa Vieussensii) joining it to the middle cervical ganglion in front of that vessel. It communicates with the seventh and eighth spinal nerves, and gives branches of distribution to the heart and to the subclavian artery and its branches, especially the vertebral. The thoracic part of the sympathetic cord has usually eleven ganglia, which receive both white and grey rami communicantes from the spinal nerves (fig. 6); of the former the upper ones run up in the chain and come off from the cervical ganglia as already described, while the lower ones form the three abdominal splanchnics which pass through the diaphragm (*q.v.*) and join the abdominal plexuses.

The great splanchnic (fig. 6) comes from the sixth to the ninth ganglia, and ends in the semi-lunar ganglion of the solar plexus. The small splanchnic comes from the ninth and tenth, or tenth and eleventh ganglia, and ends in the aortico-renal ganglion of the solar plexus, while the smallest splanchnic comes from the last thoracic ganglion, whether it be the tenth or eleventh, and ends in the renal plexus.

In the lumbar region the gangliated cord is very irregular; there may be four or more ganglia, and these are often fused. Gray rami communicantes are given to all the lumbar spinal nerves, and white ones are received from the first two. Most of the branches of distribution pass to the aortic plexus. The sacral gangliated cord runs down just internal to the anterior sacral foramina; it usually has four small ganglia, and the two cords end by joining the coccygeal ganglion or ganglion impar, though

the two-fourth sacral ganglia are united by transverse inter-funicular commissures. The white rami communicantes, already mentioned as the pelvic stream, from the second to the fourth sacral spinal nerves, do not enter the ganglia but pass directly to the pelvic plexuses (fig. 6).

Sympathetic Plexuses.—In the thorax are the superficial and deep cardiac plexuses and the coronary plexuses; the former receives the left superior cervical cardiac of the vagus, and lies in the concavity of the arch of the aorta. The deep cardiac plexus is larger, and lies in front of the bifurcation of the trachea; it receives all the other cardiac nerves, and communicates with the anterior pulmonary plexuses of the vagus (*see NERVE: Cranial*).

In the abdomen the solar plexus is by far the most important. It lies behind the stomach and surrounds the coeliac axis; in it are situated the semilunar, aortico-renal and superior mesenteric ganglia, and from it are prolonged subsidiary plexuses along the main arteries, so that diaphragmatic, suprarenal, renal, spermatic, coeliac, superior mesenteric, aortic and inferior mesenteric plexuses, are recognized. The hypogastric plexus is the continuation downward of the aortic, and lies just below the bifurcation of the aorta (fig. 6); it divides into two branches, which accompany the internal iliac arteries and are joined by the pelvic stream of white rami communicantes from the sacral spinal nerves and some twigs from the ganglia of the sacral sympathetic to form the pelvic plexuses. These are prolonged to the viscera along the branches of the internal iliac artery, so that haemorrhoidal, vesical, prostatic, vaginal and uterine plexuses are found. By the side of the neck of the uterus in the last-named plexus several

small ganglia are seen. (For the literature of the sympathetic system, *see* Quain, *Anatomy*, London.)

EMBRYOLOGY OF NERVOUS SYSTEM

The development of the brain, spinal cord and organs of special sense (eye, ear, tongue), will be found in separate articles. Here that of the cranial and spinal nerves and the sympathetic system is dealt with. The thoracic spinal nerves are the most typical, and one of them is the best to begin with. In fig. 7 the ganglion on the dorsal root is seen growing out from the neural crest, and the cells or neuroblasts of which it is composed become fusiform and grow in two directions as the ganglion recedes from the cord. Those which run toward the spinal cord are the axons, while those growing into the mesoderm are probably enlarged dendrites. The ventral roots rise as the axons of the large cells in the ventral

horn of the grey matter, and meet the fibres of the dorsal root on the distal side of the ganglion. As the two roots join each divides into an anterior (ventral) and a posterior (dorsal) primary division, the latter growing into the dorsal segment of its muscle plate and the skin of the back. The anterior primary division grows till it reaches the cardinal vein and dorsal limit of the coelom, and there forks into a somatic branch to the body

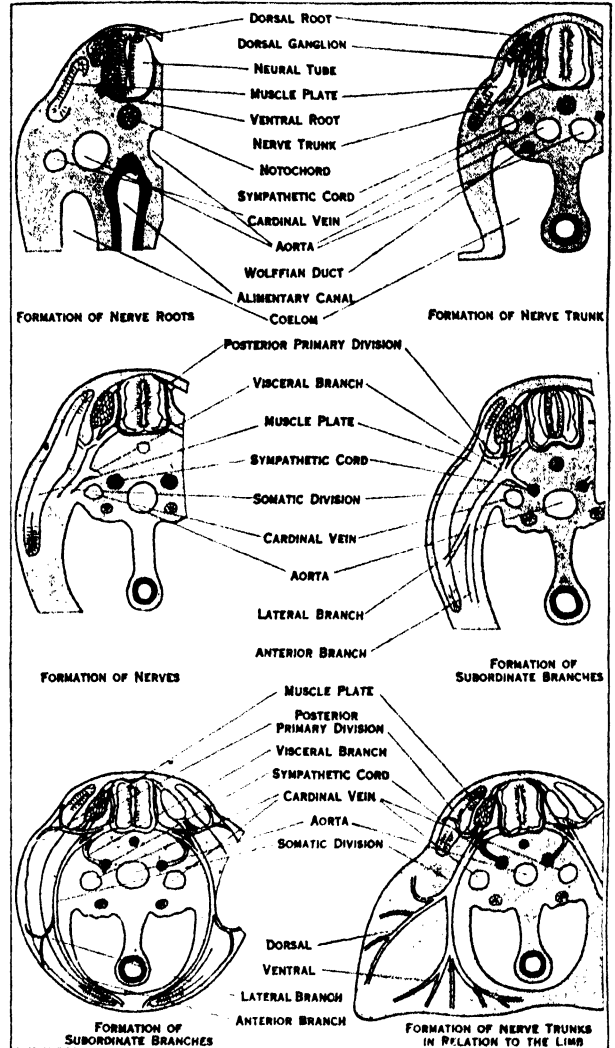

The cranial nerves are developed in the same way as the spinal, so far as concerns the facts that the motor fibres are the axons of cells situated in the basal lamina of the mesencephalon and

wall, and a splanchnic or visceral branch which joins the sympathetic and forms the white ramus communicans. The somatic branch grows round the body wall and gives off lateral and anterior branches.

FIG. 7.—DEVELOPMENT OF THE SPINAL NERVES

rhombencephalon (see BRAIN), and the sensory are the axons and dendrites of cells situated in ganglia which have budded off from the brain. The evidence of comparative anatomy, however, shows that the cranial nerves cannot be directly homologized with the spinal, nor can the fact of there being twelve of them justify us in assuming that the head contains the rudiments of twelve fused or unsegmented somites.

The sympathetic system is developed from the posterior root ganglia of the spinal nerves, by cells which in man migrate a few at a time. A. M. Paterson, however, believes that the sympathetic is developed, independently of the cerebro-spinal system, in the mesoderm (*Phil. Trans.*, B. clxxxi.).

COMPARATIVE ANATOMY

The comparative anatomy of the brain and spinal cord is dealt with in the separate articles devoted to them.

In *Amphioxus* the dorsal and ventral roots of the spinal nerves do not unite with one another but alternate, a dorsal root on one side being opposite a ventral on the other. The dorsal roots are both sensory and motor, the ventral only motor. In the *Cyclostomata* (*Petromyzon*) the arrangement is nearly the same, but in some regions there are two ventral roots to one dorsal. In the

fishes and higher vertebrates the dorsal and ventral roots unite, though in selachian (shark) embryos the dorsal and ventral roots alternate (F. M. Balfour, *The Development of Elasmobranch Fishes*, London, 1878).

The cranial nerves are only represented by two pairs in *Amphioxus*. In the Cyclostomata, fishes and Amphibia, ten pairs of nerves are found, which in their distribution do not always agree with those of man. In the Amniota or reptiles, birds and mammals, the eleventh and twelfth nerves have been added. The cranial nerves are formed of at least five components: (1) ventral motor, (2) lateral motor, (3) somatic sensory, (4) visceral sensory, (5) lateral line nerves.

The *ventral motor components* are those which rise from cells situated close to the mid line, and probably correspond to the ventral roots of the spinal nerves. The nerves to the eye muscles (motor oculi, trochlearis and abducens) have this origin (see NERVE: *Cranial*), as also has the hypoglossal, which doubtless is a cephalized spinal nerve.

The *lateral motor components* rise from cells situated more laterally, and comprise the motor roots of the fifth (trigeminal), seventh (facial), and ninth, tenth and eleventh (glossopharyngeal, vagus and spinal accessory). These nerves supply muscles belonging to the branchial skeleton, instead of the muscles of the primitive cranium, of which the eye muscles are the remnants.

The *somatic sensory components* supply the skin, and end in cells which, among the cyclostomes and fishes, form a considerable elevation in the rhombencephalon, known as the nucleus quinti (fig. 8). These components, in the lower forms, are found in the fifth, seventh and tenth nerves, but in mammals practically only the fifth contains them. They correspond to the dorsal roots of the spinal nerves.

The *splanchnic sensory or viscero sensory components* end in the brain in the medullary cells known as the *fasciculus communis* in fishes, and named the *fasciculus solitarius* in mammals, as well as in the nucleus vagi (fig. 8). They are found in the fifth, seventh, ninth, tenth and eleventh nerves, and supply visceral surfaces. In mammals the lingual and palatine branches of the fifth, the chorda tympani and great superficial petrosal of the seventh, and all the sensory fibres of the ninth and tenth except Arnold's nerve, represent these. In fishes and Amphibians the palate is supplied by the seventh nerve instead of the fifth.

FIG. 8.—A. BRAIN. B. CHOROID PLEXUSES OF LAMPREY

The system of the lateral line or acustico-lateralis component is sometimes regarded merely as a subdivision of the somatic sensory. It is best developed in the fish, and may be divided into pre- and post-auditory and auditory. The pre-auditory part comprises the pit and canal end organs supplied by the seventh, and also probably the olfactory organ supplied by the first nerve. The auditory apparatus, supplied by the eighth nerve, is, according to modern opinion, undoubtedly a part of this system, while the tenth nerve sends a large branch along the lateral line supplying the special end organs of the post-auditory part.

The following table, slightly modified from the one drawn up by J. McMurrich, gives a fair idea of the present state of our knowledge of the nerve components in the Mammalia.

NESFIELD, WILLIAM EDEN (1835-1888), British architect, one of the leaders of the Gothic revival in England, was born in Bath on April 2, 1835, and died in Brighton on March 25, 1888. His father, Maj. William Andrews Nesfield, a well-known landscape gardener, laid out Regent's park and St. James's park and remodelled Kew. Nesfield was educated at Eton and articulated successively to William Burn, a classicist, and Anthony Salvin of the Gothic school. He then travelled for study in France, Italy and Greece. The volume of his *Sketches from France and Italy* (1862) became one of the text-books of the Gothic revival. In 1859 Nesfield settled in London and began in 1862 a nominal partnership with Norman Shaw, when they shared rooms, but never collaborated. Nesfield's principal work was in domestic architecture, wherein he showed a mastery of planning and construction and a conscientious regard for detail. As he progressed he forsook the early French style of his earlier work, as seen in Combe abbey and Cloverly hall (1864) and developed a purely English manner, coming at last to English renaissance, as at Kinnel park. Among his other notable works are the lodge at Regent's park (1864) and at Kew gardens (1866); Farnham Royal house, Leawood, Loughton hall, Westcombe park, the Rose and Crown hotel and the bank at Saffron Walden. Many of his sketches and measured drawings are in the library of the Royal Institute of British Architects.

NEST. Nidification or the practice of making nests concerns all that appertains to the preparation for the reception of eggs, or newly-born young, and the subsequent care thereof on emergence. Our conceptions of nidification are commonly derived from observations on birds; but mammals, reptiles, amphibia and fishes, as well as invertebrates, include species which make more or less elaborate preparation in advance for the reception of their young.

The first stage in this sequence commonly consists in the selection of a definite site whereon, with a few exceptions, a nest is built in, or on which the eggs, or young, are deposited. Two factors govern this preparation,—the conditions of the environment, and the state of the young on emergence.

NESTING HABITS OF BIRDS, MAMMALS, INVERTEBRATES AND FISHES

1. Nest of the humming bird (*Pantherpe insignis*), Costa Rica, made of moss and spiders' webs. 2. Japim Hang-nests (*Cassicus persicus*), Amazon, with their nest of woven grass suspended from a tree branch. 3. Nest of the black and yellow crested oaclique, Mexico, sometimes several feet in length, made of grass and strips of palm leaf. 4. Reed warbler, England, and its cup-shaped nest of reed stems supported by several upright reeds. 5. The feathered nest of the palm swift, usually agglutinated to the under surfaces of palm leaves or grass roofs of huts. 6. Hanging nest of the Turkistan *Remera*, formed of dried grasses and feathers. The bottle-neck entrance affords protection against intruders. 7. Nest of the social weaver bird, Africa. It consists of an umbrella-shaped roof of grass sheltering an under surface honeycombed with numerous feather lined cavities. 8. Hanging nest of the *Remera* of Rumania, constructed of lichens, mosses and grass, lined with feathers. 9. Clay nest of the red oven-bird (*Furnarius*

rufus), South America, usually about a foot in diameter. 10. Nest of twigs lined with dry leaves built by a group of Anis, Mexico. It is large enough to accommodate all the females of the company who deposit their eggs in layers separated by leaves. 11. Nest of the woodcock, a hollow scratched in the ground. 12. View of a gopher turtle habitat (*Gopherus polyphemus*) (Daudin) in a sand dune showing the pile in front of the burrow where the turtle deposits its eggs. 13. Nest of the cape (African) weaver birds, constructed of grass stems and vegetable fibers suspended by long "arms" from trees, bushes or eaves. 14. Underground burrow of the mole, lined with grass. 15. Nest of the harvest mouse, woven of grass and leaves of corn and attached to cornstalks. 16. Butterfish (*Pholis gunnellis*) coiled around an egg mass in the reversed upper valve of a dead oyster shell. 17. Red backed salamander (*Plethodon cinereus*) guarding its eggs in the moist shadow of a cave nest. 18. Grass spider (*Agalena*)

Birds.—With the birds a nest is not invariably made, as for example with the guillemot whose single egg is deposited on a bare ledge of rock projecting from the face of a cliff rising steeply from the sea. Species which haunt sandy wastes make little or no preparation by way of a nest. This receptacle seems originally to have been made for the purpose of keeping the incubating bird, and the eggs, from contact with cold, damp earth.

Much more elaborate are the nests of the smaller species. These placed in hedgerows, or bushes, or even on the ground, are bowl-shaped structures made of fine grass-stems interwoven with horse-hair, and cunningly masked by moss or lichen, as in the case of the long-tailed titmouse. Some, like the thrush, use a foundation of clay, and line the interior of the nest with a mixture of decayed wood and cow-dung. Some of the African weaver-birds, and of the American hang-nests, suspend the nest, which is made of long grass-stems, and vegetable fibres, by a long "rope" attached to the bough of a tree. Towards the end this rope is enlarged to form a spherical chamber, with an entrance at the side in the hang-nests; and at the end of a further extension of the rope beneath the nest in the weavers.

Some of the flower-peckers of Africa build a nest of felted cotton-down. A few species make a more or less extensive use of saliva as a cement for mud-built nests, as with the swallow-tribe, the oven-bird, and the flamingo. The use of salivary glands in nest-building attains to its maximum with the edible swifts which use saliva alone. Such nests are used by the Chinese in making bird's nest soup.

Hollow trees are used by many birds, such as the parrots and the woodpeckers, the eggs being deposited on the rotten wood at the bottom of the hole. Others, like the sand-martin and the kingfisher drive long tunnels into the face of a sand-bank, enlarging the end of the tunnel to form a nest-chamber. The greatness of this achievement is commonly overlooked; for it would be difficult to find birds more apparently unsuited for such a task, since the sand-martin has the feeblest of feet and an extremely short beak, while the short legs, and syndactyle toes of the kingfisher, coupled with its long, pointed beak, seem still less fitted for burrowing.

While there is general conformity of type characteristic of the nests of the different groups of birds, there are striking exceptions to the rule. Thus the stork-tribe are content with a simple platform of sticks; but the hammer-head (*Scopus umbretta*) builds a huge nest of mud and sticks, covered in by a roof so substantial as to bear easily the weight of a man. This roof may be as much as 6 ft. across. The flamingo, again, builds a steep pedestal of mud, the top of which is scooped out to receive the eggs. Parrots nest in hollow trees, but the quaker-parrot (*Myopittacus*) of South America builds a large domed nest of sticks.

The Gallinaceous birds make little more than an apology for a nest, fashioned in a depression in the ground. But the megapodes of Celebes, New Guinea and Australia build a huge mound of decaying vegetable matter, and laying their eggs deep down in the fermenting mass leave them to hatch by the heat thus engendered.

One of the most remarkable cases of nidification among birds is furnished by the horn-bills. The eggs are laid at the bottom of a cavity in a tree, and as soon as the female has started incubation, the entrance-hole is closed by the male by means of clay; but a space is left open wide enough for his mate to push her beak through to receive food.

NON-AVIAN NEST-MAKERS

Mammals.—Few other animals have attained to the skill in weaving displayed by birds. The harvest-mouse among the mammals is, however, the rival of most birds. The rabbit builds a nest in her burrow, and lines it with the under-fur plucked from her body, forming a parallel to the case of the ducks, geese and swans, which line the nest with down similarly plucked from the breast for this purpose.

The only nest-building mammals which produce eggs are the *Echidna*, or spiny ant-eater, and the duck-billed platypus or *Ornithorhynchus*. The nest is of the simplest character, placed

in a chamber at the end of a long tunnel dug by the animal.

Reptiles.—Among the reptiles nest-building goes little or no further than digging a hole in the ground, and depositing the eggs within it, leaving them to their fate as in the case of the megapodes among the birds. The European pond-tortoise, however, takes a little more trouble. She first prepares the ground by watering it from the bladder, and from special anal water-sacs. Then, boring a hole with the tail, as one would use a stick, the feet are used to enlarge it. When about five inches deep the eggs are laid at the bottom, and the soil is put back again and beaten down flat.

The crocodile digs a hole in the sand nearly two feet deep, laying her eggs therein and covering them up. But she returns periodically to sleep above her treasures. She is thus at hand to assist the young to escape at the time of hatching. She is warned of this by the noise they make in endeavouring to break through the shell; just as young birds announce their advent by cheeping before the shell is actually broken. When they have all emerged the mother escorts them to the water. The alligator, on the other hand, builds a great mound of decaying leaves, mixed with fine earth, to a height of about three feet, and as much as eight feet in diameter. Some eight inches from the surface the eggs, twenty to thirty, white and hard-shelled, are laid.

The python, among the snakes, like *Ichthyophis* among the Amphibia coils her body around the eggs until they hatch, and guards her young for some time after.

Amphibia.—The Amphibia furnish instances of nidification of a very remarkable character, and at the same time, provide valuable material for the study of behaviour in regard to the parental instincts to serve as a standard of comparison with the higher vertebrates on the one hand, and the lower on the other.

The frogs of the genus *Phyllomedusa* build nests recalling that of the tailor-bird. The process of this nest-making has been watched in *Phyllomedusa hypochondria*, the *Wollenkuck* of the Paraguayan Chaco. The female carries the male upon her back while searching for a suitable leaf—which must be of some tree overhanging the water. This found, both then seize it and hold the edges together with their hind-feet, while the female pours her eggs into the funnel thus formed, the male fertilizing them as they pass in. The gelatinous envelope of the eggs suffices to hold the leaf-edges in position as they are brought together in the filling process which goes on until about 100 eggs are laid.

Fishes.—Among the fishes the fresh-water sticklebacks (*Gastrolepis*) and the marine fifteen-spine stickleback (*Spinachia*) build nests of weeds, the task being undertaken by the male, who uses, as a binding material, a secretion formed by the kidneys. He undertakes the sole charge of the eggs and young. The gourami (*Ospromemus*) of the Malay Archipelago fashions a nest of air-bubbles toughened by a kind of saliva, and mounts guard over both eggs and young. The Cichlid fishes both of America and the Old World, as well as some of the Siluroid fishes, carry the young in the mouth; in some species both sexes do this, in others the male alone. The male pipe-fish carries the eggs and young in a pouch running along the belly. The Aspredo of the Guianas carries her eggs attached to the under surface of the head, belly and paired-fins. For their accommodation the skin assumes a spongy condition so that each comes to lie within a deep depression, recalling the egg-pits of the Surinam toad, but in the case of Aspredo the pits are shallow and the larvae are not retained there.

Invertebrates.—Among the insects the elaborate care for the eggs and young displayed by the ants, bees and wasps is too well known to need further mention. The scorpions and the wolf-spiders carry their young about on their backs until they can fend for themselves; and some of the scorpions, again, like the wolf-spiders, bear their eggs about closely packed within a spherical silken bag.

Among the Echinoderms we find an Antarctic sea-slug (*Cucumaria crocea*) carrying the young on its back. One of the sea-urchins (*Hemiaster philippi*), and a starfish (*Asterias spirabilis*) carry the young in brood-pouches on the back in the case of the sea-urchin, and around the mouth in the starfish. It would seem that only Arctic and Antarctic species behave after this fashion.

In all other cases the young leave the parent as minute, free-swimming larvae, undergoing a complicated metamorphosis before attaining to the adult form. Here, then, we must regard the care of the young as an entirely impersonal, unconscious act, determined by the physical peculiarities of the external environment. This is a factor to be borne in mind in considering the origin, and evolution, of nidification in animals of all grades. (W. P. P.)

NESTOR (c. 1056–c. 1114), the reputed author of the earliest Russian chronicle, was a monk of the Pecherskiy cloister of Kiev from 1073. The only other known fact of his life is that he was commissioned with two other monks to find the relics of St. Theodosius, a mission which he succeeded in fulfilling. The chronicle begins with the deluge, as those of most chroniclers of the time did. The compiler appears to have been acquainted with the Byzantine historians; he makes use especially of John Malalas and George Hamartolus. He also had in all probability other Slavonic chronicles to compile from, which are now lost. Many legends are mixed up with Nestor's *Chronicle*; the style is occasionally so poetical that perhaps he incorporated *bilini* which are now lost. The early part is rich in these stories, among which are the arrival of the three Varangian brothers, the founding of Kiev, the murder of Askold and Dir, the death of Oleg, who was killed by a serpent concealed in the skeleton of his horse, and the vengeance taken by Olga, the wife of Igor, on the Drevlians, who had murdered her husband. The account of the labours of Cyril and Methodius among the Slavs is also very interesting, and to Nestor we owe the tale of the summary way in which Vladimir suppressed the worship of Perun and other idols at Kiev. As an eyewitness he could only describe the reigns of Vsevolod and Sviatopolk (1078–1112), but he gathered many interesting details from the lips of old men, two of whom were Giurata Rogovich of Novgorod, who gave him information concerning the north of Russia, Petchora, and other places, and Jan, a man ninety years of age, who died in 1106, and was son of Vishata the voivode of Yaroslavl and grandson of Ostromir the Posadnik, for whom the *Codex* was written. Many of the ethnological details given by Nestor of the various races of the Slavs are of the highest value.

The latest theory about Nestor is that the *Chronicle* is a patchwork of many fragments of chronicles, and that the name of Nestor was attached to it because he wrote the greater part or perhaps because he put the fragments together.

The *Chronicle* has come down to us in several manuscripts, but unfortunately no contemporary ones, the oldest being the so-called Lavrentievski of the 14th century (1377). It was named after the monk Lavrentii, who copied it out for Dimitri Constantinovich, the prince of Souzdal. The work, as contained in this manuscript, has had many additions made to it from previous and contemporary chronicles, such as those of Volinia and Novgorod. Soloviev, the Russian historian, remarks that Nestor cannot be called the earliest Russian chronicler, but he is the first writer who took a national point of view in his history, the others being merely local writers. The language of his work, as shown in the earliest manuscripts just mentioned, is Palaeo-Slavonic with many Russisms.

The *Chronicle* has been translated into Polish, Bohemian, German and French. The compiler cannot very well be the author of the lives of Boris and Gleb, the martyrs, and of the life of St. Theodosius, because they contradict many passages in the *Chronicle*. The work is of primary importance for early Russian history, and has amusing episodes of an Herodotean character. The reputed body of the ancient chronicler may be seen among the relics preserved in the Pecherskiy monastery at Kiev.

See Louis Leger, *Chronique dite de Nestor* (Paris, 1884); Bestuzhev Riumin, *On the Composition of the Russian Chronicles till the end of the 14th century* (in Russian) (St. Petersburg, 1869). (W. R. Mo.)

NESTOR, in Greek legend, son of Neleus and Chloris, king of Pylos (Kakovátos) in Elis. When all his brothers were slain by Heracles, in consequence of the refusal of Neleus to purify him for the murder of Iphitus, Nestor alone escaped. In the *Iliad*, he is about 70 years old, full of good advice and of stories of his early exploits. In the *Odyssey*, he is seen by Telemachus at

Pylos. The name is used in modern times for any old man of ripe experience, or the oldest member of a class or corporation.

NESTOR, the name of a small group of parrots peculiar to New Zealand. The type is *Nestor meridionalis*, the kaka, an olive-brown bird about as big as a crow. The larger *N. notabilis*, the kea (*q.v.*) has developed the habit of attacking sheep to obtain the kidneys. It also eats carrion, grubs, fruits and seeds. A third, more brightly coloured species is said to have inhabited Norfolk Island and a fourth Phillip Island; both of these are now extinct and no specimens of the former are known to exist.

NESTORIANS. The present article deals not with the life and doctrine of Nestorius (*q.v.*) but with the Eastern Churches called by his name.

A christology of the kind usually called Nestorian was eagerly and successfully propagated in Syria and Persia by Ibas, bishop of Edessa (435) and Barsumas, bishop of Nisibis. In Persia the old churches were stimulated into vigour and new ones founded. Their centre was at Ctesiphon on the Tigris, a busy trading city. The church traced its doctrines to Theodore of Mopsuestia rather than to Nestorius, whose name at first they repudiated, not regarding themselves as having been proselytized to any new teaching. After the Mohammedan invasion of Persia early in the 7th century the Nestorians were able to come to terms with the invaders; and for five centuries the Nestorians were a recognized institution within the territory of Islam, though their treatment varied from kindly to harsh. But the barbaric invasions of the 13th and 14th centuries fell with crushing force on the Nestorians. In 1258 Hulagu Khan took Baghdad, and about 1400 Timur again seized and sacked the city. Though the Nestorians were numerous, their moral influence and their church life had greatly deteriorated. Those who escaped capture by Timur fled to the mountains of Kurdistan, and the community that had played so large a part in Mesopotamian history for a thousand years was thus shattered. Various attempts during the 16th century to promote union between the Nestorians and Rome proved fruitless, but the Roman Church has never ceased in its efforts to absorb this ancient community.

The Nestorians showed a zeal for evangelization which resulted in the establishment of their influence throughout Asia, as is seen from the bishoprics founded not only in Syria, Armenia, Arabia and Persia, but at Halaban in Media, Merv in Khurasan, Herat, Tashkent, Samarkand, Baluk, Kashgar, and even at Kambaluk (Pekin) and Singan fu (Hsi'en fu) in China, and Kaljana and Kranganore in India. Mongolian invasions and Mohammedan tyranny have, of course, long since swept away all traces of many of these. The 400,000 Syrian Christians ("Christians of St. Thomas," see THOMAS, ST.) who lived in Malabar no doubt owed their origin to Nestorian missionaries, the stories of the evangelization of India by the Apostles Thomas and Bartholomew having no real historical foundation, and the Indian activity of Pantaeus of Alexandria having proved fruitless, in whatever part of India it may have been exercised. The theology of the Indian Syrian Christians is of a Nestorian type, and Cosmas Indicopleustes (6th century) puts us on the right track when he says that the Christians whom he found in Ceylon and Malabar had come from Persia (probably as refugees from persecution, like the Huguenots in England and the Pilgrim Fathers in America). Pehlevi inscriptions found on crosses at St. Thomas's Mount near Madras and at Kottayam in Travancore, are evidence both of the antiquity of Christianity in these places (7th or 8th century), and for the semi-patri-passianism (the apparent identification of all three persons of the Trinity in the sufferer on the cross) which marked the Nestorian teaching. In 745 Thomas of Kana brought a new band of emigrants from Baghdad and Nineveh, and possibly the name "Christians of St. Thomas" arose from confusion between this man and the apostle. Other reinforcements came from Persia in 822, but the Malabar church never developed any intellectual vigour or missionary zeal. They had their own kings, lived as a close caste, and even imitated the Hindus in caste regulations of food and avoidance of pollution. In 1330 Pope John XXII. issued a bull appointing Jordanus, a French Dominican, bishop of Quilon, and inviting the Nestorians to enter "the Christian Church." The

invitation was declined, but in the 16th century the Syrian Christians sought the help of the Portuguese settlers against Mussulman oppression, only to find that before long they were subjected to the fiercer perils of Jesuit antagonism and the Inquisition. The Syrians submitted to Rome at the synod of Dampier in 1599, but it was a forced submission, and in 1653 when the Portuguese arrested the Syrian bishop just sent out by the catholicus of Babylon, the rebellion broke out. The renunciation was not quite thorough, one party adhering to the Roman Church as Romo-Syrians, the others reverting wholly to Syrian usages and forming to-day about three-fourths of the whole community.

WIDESPREAD MISSIONS

Early evidence of Nestorian missions in China is extant in the tablet found in 1625 at Chang'an in the district of Hsi'en-fu, province of Shensi. It commemorates "the introduction and propagation of the noble law of Ta t'sin in the Middle Kingdom," and beneath an incised cross sets out in Chinese and Syriac an abstract of Christian doctrine and the course of a Syrian mission in China beginning with the favourable reception of Olopan, who came from Judaea in 636. For two generations the little cause prospered, and again after persecutions in 699 and 813. Later on a second mission arrived, many churches were built and several emperors patronized the faith.

In the 10th century the Nestorians introduced Christianity into Tartary proper; in 1274 Marco Polo saw two of their churches. The legend of Prester John is based on the idea of the conversion of a Mongol tribe, the Karith, whose chieftain Ung Khan at baptism received the title Malek Juchana (King John). Their activity may well be said to have covered the continent. Their campaign was one of deliberate conquest, one of the greatest ever planned by Christian missionaries. Marco Polo is witness that there were Nestorian churches all along the trade routes from Baghdad to Peking.

The Modern Nestorians.—The Nestorians or East Syrians (*Surayi*) of Turkey and Persia now inhabit a district bounded by Lake Urmia, or Urumia, on the east, stretching westwards into Kurdistan, to Mosul on the south, and nearly as far as Van on the north. It is only of late years, under the influence of the different missions, that education, ruined by centuries of persecution, has revived amongst the Nestorians; and even now the mountaineers, cut off from the outer world, are as a rule destitute of learning, and greatly resemble their neighbours, the wild and uncivilized Kurds. They are, however, extraordinarily tenacious of their ancient customs, and, almost totally isolated from the rest of Christendom since the 5th century, they afford an interesting study to the ecclesiastical student. Their churches are rude buildings, dimly lighted and destitute of pictures or images, save that of the Cross, which is treated with the deepest veneration. There are three liturgies—of the Holy Apostles, of Theodore and of Nestorius. The first is quite free from Nestorian influence, dates from some remote period, perhaps prior to 431, and is certainly the most ancient of those now in use in Christendom; the other two, though early, are undoubtedly of later date. The Nestorian canon of Scripture seems never to have been fully determined, nor is the sacramental system rigidly defined. Nestorian writers, however, generally reckon as sacraments the Priesthood, the Oil of Unction, the Offering of the Body and Blood of Christ, Absolution, the Holy Leaven and the Signation of the life-giving Cross. The "Holy Leaven" is reputed to be a part of the original bread of the first Eucharist, brought by Addai and Mari and maintained ever since in the Church; it is used in the confection of the Eucharistic wafers, which are rather thicker than those used in the Western Church. Communion is given in both kinds, as throughout the East; likewise, confirmation is administered directly after baptism. Sacramental confession is enjoined, but has recently become obsolete; prayers for the departed and invocation of saints form part of the services. The bishops are always celibates and are chosen from episcopal families. The service-books were wholly in ms. until the press of the archbishop of Canterbury's mission at Urmia issued the *Takhsa* (containing the liturgies, baptismal office, etc.) and several other liturgical texts.

The Nestorians commemorate Nestorius as a saint, and invoke his aid and that of his companions. They reject the Third Oecumenical Council, and though showing the greatest devotion to the Blessed Virgin, deny her the title of *Theotokos*, i.e., the mother or bearer of God. Their theological teaching is misty and perplexing; but systematic or even consistent theological thinking is not their primary interest (see J. F. Bethune-Baker, *Nestorius and his Teaching*). The peculiar circumstances, both ecclesiastical and temporal, of the Nestorians have attracted much attention in western Christendom, and various missionary enterprises amongst them have resulted (see authorities named below).

NESTORIUS (d. c. 451), Syrian ecclesiastic, patriarch of Constantinople from 428 to 431, was a native of Germanicia at the foot of Mount Taurus, in Syria. The year of his birth is unknown. He received his education at Antioch, probably under Theodore of Mopsuestia. As monk in the neighbouring monastery of Euprepus, and afterwards as presbyter, he became famous in the diocese for his asceticism, his orthodoxy and his eloquence. He was nominated by Theodosius II. patriarch of Constantinople, and was consecrated on April 10, 428. He immediately set to work to extirpate heresy in his diocese, beginning by the suppression of the assemblies of the Arians. These, by a bold stroke of policy, anticipated his action by themselves setting fire to their meeting-house, Nestorius being forthwith nicknamed "the incendiary." His repression of the Novatians and the Quartodecimans led to serious disturbances at Sardis and Miletus. The toleration the followers of Macedonius had long enjoyed was also broken, the recently settled Pelagians alone finding any respite. One of the practices assailed by Nestorius was the custom, which had become almost universal in Constantinople, of bestowing the epithet *Θεοτόκος* "Mother of God," upon Mary the mother of Jesus. From Antioch Nestorius had brought along with him to Constantinople a co-presbyter named Anastasius, who enjoyed his confidence and is called by Theophanes his "syncellus." This Anastasius, in a pulpit oration which the patriarch himself is said to have prepared for him, caused great scandal to the partisans of the cult of Mary by saying, "Let no one call Mary the mother of God, for Mary was a human being; and that God should be born of a human being is impossible."

Cyril (*q.v.*) of Alexandria seized his opportunity. He stirred up his own clergy, he encouraged the dissidents at Constantinople, he addressed himself to the sister and wife of the emperor, and he bribed the officials of the court. He also sent to Rome a careful selection of Nestorius's sayings and sermons. Nestorius himself, on the other hand, having occasion to write to Pope Celestine I. about the Pelagians (whom he was not inclined to regard as heretical), gave from his own point of view an account of the disputes which had recently arisen within his patriarchate. Celestine naturally resented any questioning of the Roman decision concerning the Pelagians, and was jealous of the growing power of the Constantinople see. In a synod which met in 430, he decided in favour of the title *Θεοτόκος*, bade Nestorius retract his erroneous teaching, on pain of instant excommunication, and entrusted the execution of this decision to the patriarch of Alexandria.

In this situation of affairs the demand for a general council became irresistible, and accordingly Theodosius and Valentinian III. issued letters summoning the metropolitans of the Catholic church to meet at Ephesus at Whitsuntide 431, each bringing with him some able suffragans. Nestorius, with sixteen bishops and an armed following, Cyril with fifty bishops, Juvenal of Jerusalem, and Flavian of Thessalonica arrived. John of Antioch was delayed on his journey, and wrote requesting that the opening of the

synod should not be delayed on his account. Cyril and his friends assembled in the church of the Theotokos on June 22, and summoned Nestorius to give an account of his doctrines. He replied that he would appear when all the bishops were assembled; and the imperial commissioner, Candidian, formally protested against the opening of the synod. Cyril and the 159 bishops who were with him nevertheless proceeded to read the imperial letter of convocation, and afterwards the letters which had passed between Nestorius and Cyril. The entire assembly then cried anathema on Nestorius and his doctrines, and the decree of his exclusion from the episcopate and from all priestly communion was solemnly read and signed by all present. The accused and his friends never had a hearing.

The populace accompanied the members with torches and censers to their lodgings, and there was a general illumination of the city. A few days afterwards (June 26th or 27th) John of Antioch arrived; whether inclined or not to the cause of his former copresbyter, he disapproved the precipitancy with which Cyril had acted, and at a *conciliabulum* of forty-three bishops held in his lodgings he was induced by Candidian, the friend of Nestorius, to depose the bishops of Alexandria and Ephesus on the spot. The Ephesians intervened to prevent the execution of this decision on the next Sunday. Meanwhile a letter from the emperor declared invalid the session at which Nestorius had been deposed unheard; numerous sessions and counter-sessions were afterwards held, the conflicting parties both seeking the imperial support. In the end Theodosius decided to confirm the depositions which had been pronounced on both sides, and Cyril and Memnon as well as Nestorius were by his orders laid under arrest. Representatives from each side were now summoned before him to Chalcedon, and at last, yielding to the sense of the evident majority, he gave a decision in favour of the "orthodox," and the council of Ephesus was dissolved. Maximian, one of the Constantinopolitan clergy, a native of Rome, was promoted to the vacant see, and Nestorius was henceforward represented in the capital only by one congregation, which presently became extinct.

But the Antiochenes maintained for some time an attitude of antagonism towards Cyril and his creed, and were not pacified until an understanding was reached in 433 on the basis of a new formula involving some concessions by him. The union even then was opposed by certain bishops, who were deposed from their sees. Their school at Edessa was closed by Zeno in 489. Immediately after his deposition Nestorius withdrew into private life in his old monastery of Euprepis, Antioch, until 435, when the emperor ordered his banishment to Petra in Arabia. A second decree, it would seem, sent him to Oasis, probably the city of the Great Oasis, in Upper Egypt, where he was still living in 439, at the time when Socrates wrote his *Church History*. He was taken prisoner by the Blemmyes, a nomad tribe that gave much trouble to the empire in Africa, and when they set him free in the Thebaid near Panopolis (Akhmim) c. 450, they exposed him to further persecution from Schenute, the hero of the Egyptian monks. There is some evidence that he was summoned to the Council of Chalcedon, though he could not attend it, and in the concluding portion of his book known as *The Bazaar of Heraclides* he not only gives a full account of the "Robber Synod" of Ephesus 449, but knows that Theodosius is dead (July 450) and seems aware of the proceedings of Chalcedon and the flight of Dioscurus, the unscrupulous successor of Cyril at Alexandria. Nestorius was already old and ailing and must have died very soon after. There are still Nestorians in Kurdistan, and the Syriac Church is Nestorian in theology, as are the churches in Asia founded by Nestorian missionaries in the middle ages.

Modern View.—Only recently has an attempt been made to judge Nestorius from some other evidence than that afforded by the accusations of Cyril and the inferences drawn therefrom. This other evidence consists partly of letters from Nestorius, preserved among the works of those to whom they were written, some sermons collected in a Latin translation by Marius Mercator, an African merchant who was doing business in Constantinople at the time of the dispute, and other material gathered from Syriac manuscripts. Since the helpful collection of *Nestoriana* published

by Dr. F. Loofs in 1905 there has also come to our knowledge the most valuable evidence of all, Nestorius's own account of the whole difficulty, viz., *The Bazaar of Heraclides of Damascus*. This pseudonym served to protect the book against the fate that overtook the writings of heretics, and in a Syriac version it was preserved in the Euphrates valley where the followers of Nestorius settled. Ebed Jesu in the 14th century mentions it together with *Letters* and *Homilies*, as well as the *Tragedy*, or a *Letter to Cosmas*, the *Theopaschites* (of which some fragments are still extant) and the *Liturgy*, which is still used by the Nestorian Church. The discovery of *The Bazaar*, which is the *Apologia* of Nestorius, was made public by Dr. H. Goussen (though members of the Archbishop of Canterbury's Mission to the Assyrian Christians had previously been acquainted with the book). The text has been edited by P. Paul Bedjan (Leipzig, 1910) and a French translation has been made by M. l'abbé F. Nau. A representative selection of extracts has been given to English readers in J. F. Bethune-Baker's *Nestorius and his Teaching* (Cambridge, 1908), chapter ii. of which describes the ms. and its accounts.

NET. A fabric of thread, cord or wire, the intersections of which are knotted so as to form a mesh. The art of netting is intimately related to weaving, knitting, plaiting and lace-making, from all of which, however, it is distinguished by the knotting of the intersections of the cord. It is one of the most ancient and universal of arts, having been practised among the most primitive tribes, to whom the net is of great importance in hunting and fishing. Net is a common Teut. word, of which the origin is unknown; it is not to be connected with "knit" or "knot." The term "net," i.e., remaining after all deductions, charges, etc., have been made, as in "net profit," is a variant of "neat," tidy, clean, Lat. *nitidus*, shining. Net-making, as a modern industry, is principally concerned with the manufacture of the numerous forms of net used in fisheries, but netting is also largely employed for many other purposes, as for the temporary division of fields, for protecting fruit in gardens, for screens and other furniture purposes, for bags, appliances used in various games, etc. Since the early part of the 19th century numerous machines have been invented for netting, and several of these have attained commercial success. Fishing nets were formerly made principally from hemp fibre—technically called "twine."

The forms of fishing nets vary according to the manner in which they are intended to act. This is either by entangling the fish in their complicated folds, as in the trammel; receiving them into pockets, as in the trawl; suspending them by the body in the meshes, as in the mackerel-net; imprisoning them within their labyrinth-like chambers, as in the stake-net; or drawing them to shore, as in the seine. The parts of a net are the head or upper margin, along which the corks are strung upon a rope called the head-rope; the foot is the opposite or lower margin, which carries the foot-rope, on which in many cases leaden plummets are made fast. The meshes are the squares composing the net. The width of a net is expressed by the term "over"; e.g., a day-net is three fathoms long and one over or wide. The lever is the first row of a net. There are also accrues, false meshes or quarterings, which are loops inserted in any given row, by which the number of meshes is increased. To braid or breathe a net is to make a net.

¹Syriac, *šāgūrtā*, lit. "merchandise." The Greek word may have been *ἐμπόριον*. Nothing is certainly known of any such Heraclides.

FIG. 1.—NEEDLE USED IN NET-MAKING

Hand-Netting.—The tools used in hand-netting are the needle, an instrument for holding and netting the material; it is made with an eye E, a tongue T, and a fork F (fig. 1). The twine is wound on it by being passed alternately between the fork and round the tongue, so that the turns of the string lie parallel to the length of the needle, and are kept on by the tongue and fork. A spool or mesh-pin is a piece of round or flat wood on which the loops are formed, the perimeter of the spool determining the size of the loops. Each loop contains two sides of the square mesh; therefore, supposing that it be required to make a mesh 1in. square—that is,

FIG. 2.—DIAGRAM SHOWING COURSE OF TWINE IN FORMING A FISHERMAN'S KNOT IN NET-MAKING

measuring 1in. from knot to knot—a spool 2in. in circumference must be used. Large meshes may be formed by giving the twine two or more turns round the spool, as occasion may require; or the spool may be made flat, and of a sufficient width. The method of making the hand-knot, known as the fisherman's knot, is more easily acquired by example than described in writing. Fig. 2 shows the course of the twine in forming a single knot. From the last-formed knot the twine passes over the front of the mesh-pin, and is caught behind by the little finger of the left hand, forming the loop, thence it passes to the front and is caught by the left thumb, then through the loops as sketch indicates, after which the twine is released by the thumb and the knot is drawn taut. Fig. 3 is a bend knot used for uniting two ends of twine.

Machine-Netting.—In 1778 a netting-machine was patented by William Horton, William Ross, Thomas Davies and John Golby. In 1802 the French Government offered a reward of 10,000 francs to the person who would invent an automatic machine for net-making. Jacquard submitted a model of a machine which was brought under the notice of Napoleon I. and Carnot, and he was summoned to Paris by the emperor who asked—"Are you the man who pretends to do what God Almighty cannot—tie a knot in a stretched string?" Jacquard's model, which is incomplete, was deposited in the Conservatoire des Arts et Métiers; it was awarded a prize, and he himself received an appointment in the conservatoire, where he perfected his famous attachment to the common loom. In the United Kingdom, the first to succeed in inventing an efficient machine and in establishing the industry of machine net-making was James Paterson of Musselburgh. Paterson, originally a cooper, served in the army through the Peninsular War, and was discharged after the battle of Waterloo. He established a net factory in Musselburgh about 1820; but the early form of machine was imperfect, the knots it formed slipped readily and, there being much prejudice against machine nets, the demand was small. Walter Ritchie, native of Musselburgh, devised a method for

FIG. 3.—A BEND KNOT USED TO JOIN TWO ENDS. A AND B

forming the ordinary hand-knot on the machine nets, and the machine, patented in July 1835, became the foundation of an extensive and flourishing industry. The Paterson machine is very complex. It consists of an arrangement of hooks, needles and sinkers, one of each being required for every mesh in the breadth being made. The needles hold the meshes, while the hooks seize the lower part of each and twist it into a loop. Through the series of loops so formed a steel wire is shot, carrying with it twine for the next range of loops. This twine the sinkers successively catch and depress sufficiently to form the two sides and loop of the next mesh to be formed. The knot formed by threading the loops is now tightened up, the last formed mesh is freed from the sinkers, and transferred to the hooks, and the process of looping, threading and knotting thus continues.

Another form of net-loom, working on a principle distinct from that of Paterson, was invented and patented in France by Onésiphore Pecqueur in 1840, and again in France and in Great Britain in 1849. This was improved by many subsequent inventors; especially by Baudouin and Jouannin.

FIG. 4.—BAUDOUIN AND JOUANNIN'S NET LOOM, WHERE THE "A" SERIES IS DRAWN INTO LOOPS, OVER AND THROUGH WHICH THE "B" SERIES PASSES

Net Manufacture in the United States.—The manufacture of nets for the fisheries in the United States dates back to about 1844, being initiated by a manufacturer of cotton yarns at Canton, Massachusetts. The popularity with which the first experimental cotton twines were received led the manufacturer to devote his whole time to their manufacture and improvement. In 1858 the first netting-machine in the United States was seen. The limitations of this machine led to the development of new inventions, particularly those designed for handling heavy twines.

In 1919, there were 19 establishments manufacturing nettings, nets, scrape bags and seines. These establishments were capitalized at \$4,156,000, employing 859 persons, the value of the output being \$5,114,000. The fibre materials used are flax, cotton and manila.

In view of the wholly inadequate supply of domestic flax and as but little of it is suitable for the manufacture of netting, domestic manufacturers are dependent upon imports for their raw materials. The use of cotton in the making of nets has increased until the quantities used in 1920 exceeded those for linen. Manila is used by the domestic manufacturers in the making of trawls or other bag-nets.

Fishery apparatus employed in the fisheries of the United States and Alaska is valued at more than \$16,000,000, the greater part of which is invested in nets, nettings and lines chiefly cotton, flax and hemp. Much of this material lasts but two years at best, so that the annual investment in new netting each year is an important factor in the fisheries.

FIG. 5.—DIAGRAM SHOWING THE CONTINUATION OF THE PROCESS

NETHERLANDS. The Netherlands first became known to the Romans through the campaigns of Julius Caesar. He found the country peopled partly by tribes of Gallo-Celtic, partly by tribes of Germanic stock, the river Rhine forming roughly the line of demarcation between the races. The Gallo-Celtic tribes bore the general appellation of Belgae, and among these the Nervii, inhabiting the district between the Scheldt and the Sambre were at the date of Caesar's invasion, 57 B.C., the most warlike and important. To the north of the Meuse, and more especially in the low-lying ground enclosed between the Waal and the Rhine

(*insula Batavorum*) lived the Batavi. Beyond these were found the Frisians (*q.v.*), who gave their name to the territory between the Rhine and the Ems.

Julius Caesar, after a severe struggle with the Nervii and their confederates, was successful in bringing the Belgic tribes into subjection to Rome. Under Augustus, 15 B.C., the conquered territory was formed into an imperial province, *Gallia Belgica*, and the frontier was strongly fortified. The Batavians were first brought under Roman rule in the governorship of Drusus A.D. 13. They were not incorporated in the empire, but were ranked as allies. In 69 they revolted under a native leader, known only under his Roman name of Claudius Civilis. After the rising, they returned to their position of *socii*. Their land became a recruiting ground for the Roman armies and they were henceforth faithful in their steady allegiance to Rome.

When at the end of the 3rd century the Franks (*q.v.*) began to swarm over the Rhine into the Roman lands, the names of the old tribes had disappeared. The branch of the Franks—who were a confederacy, not a people—which gradually overspread *Gallia Belgica*, bore the name of *Salii*, from their position on the river Saale. In the days of their great king Clovis (481–511) they were in possession of the whole of the southern and central Netherlands. The strip of coast between the mouths of the Scheldt and Ems remained, however, in the hands of the Frisians (*q.v.*), and the Saxons (*q.v.*) had occupied a portion of the districts known later as Gelderland, Overijssel and Drente.

The conversion of the Franks tended to facilitate fusion between them and the Gallo-Roman population, and to accentuate the enmity between the Franks and the heathen Frisians and Saxons. In the south of the Netherlands bishoprics were set up at Cambrai, Tournai, Arras, Thérouanne and Liège. In the north progress was much slower and success was due rather to the arms of the Carolingian kings than to missionary efforts. Towards the end of the century, Charlemagne, himself a Netherlander by descent and ancestral possessions, after a severe struggle thoroughly subdued the Frisians and Saxons, and compelled them to embrace Christianity.

The Duchy of Lower Lorraine.—The Verdun treaty (843) assigned the central part of the Empire to the Emperor Lothaire, separating the kingdom of East Francia (the later Germany) from West Francia (the later France). This middle kingdom included the whole of the later Netherlands with the exception of the portion on the left bank of the Scheldt, which river was made the boundary of West Francia. On the death of the emperor, his son Lothaire II. received the northern part of his father's domain, known as *Lotharii Regnum*, corrupted later into Lotharingia and Lorraine. Lothaire had no heir, and in 870 by the Treaty of Meerssen his territory was divided between the kings of East and West Francia. In 879 East Francia acquired the whole; from 912 to 924 it formed part of West Francia. In 924 Lorraine passed in the reign of Henry the Fowler under German overlordship. Henry's son, Otto the Great, placed it in 953 in the hands of his able brother, Bruno, archbishop of Cologne, for pacification. Bruno, who kept for himself the title of archduke, divided the territory into the two duchies of Upper and Lower Lorraine. Godfrey of Verdun was invested by him with the government of Lower Lorraine. The history of the Netherlands from this time forward—with the exception of Flanders, which continued to be a fief of the French kings—is the history of the various feudal States into which the duchy of Lower Lorraine was gradually broken up. (See FLANDERS; HOLLAND; BRABANT; GELDERLAND; LIMBURG; UTRECHT; LIÈGE.)

The development of feudalism in the Netherlands was largely due to the necessity of protecting the land against the Scandinavian attacks of the 9th and 10th centuries. For a time near the middle of the 9th century the Northmen were masters of all Holland and Friesland, though they never established permanent settlements there. On one occasion, in 880, the emperor, Charles the Fat, led an army against the Northmen, then encamped at Elslloo, but the remoteness of the Netherlands from the centres of either French or imperial power threw the burden of defence upon local magnates, and a great increase in their author-

ity was the inevitable consequence. Long before the end of the 11th century the system of feudal States had been firmly established in the Netherlands. The part which their rulers played in the Crusades is a proof of their order and prosperity.

EARLIEST CHARTERS

Rise of the Cities in the Netherlands.—Little is known about the Netherlands towns before the 12th century. The earliest charters date from that period. The charters were of the nature of a treaty between the city and its feudal lord, and they differed much in character according to the importance of the place and the pressure it was able to put upon its sovereign. The extent of the rights which the charter conceded determined whether the town was a free town or a commune. In the case of a commune the concessions included generally the right of inheritance, justice, taxation, use of wood, water, etc. The lord's representative, entitled "justiciary" (*schout*) or "bailiff" (*baljuw*), presided over the administration of justice and took command of the town levies in war. The *gemeente*—consisting only of those bound by the communal oath for mutual help and defence—elected their own magistrates. These electors were often a small proportion of the whole body of inhabitants: sometimes a few influential families alone had the right, and it became hereditary. The magistrates bore the name of *scabini*, and at their head was the seigniorial official—the *schout* or *baljuw*. These *scabini* appointed from the citizens a body of sworn councillors to assist them whose presidents, styled "burgomasters," had the supervision of the communal finances.

The most powerful and flourishing of all were those of Flanders—Ghent, Bruges and Ypres. In the 13th century these towns had become the seat of large industrial populations employed upon the weaving of cloth with its dependent industries, and closely bound up by trade interests with England, whence they obtained the wool for their looms. Bruges, at that time connected with the sea by the river Zwiijn and with Sluis as its port, was the central mart and exchange of the world's commerce. In these Flemish cities the early oligarchic form of municipal government speedily gave way to a democratic. The great mass of the townsmen organized in trade guilds—weavers, fullers, dyers, smiths, leather-workers, brewers, butchers, bakers and others, of which by far the most powerful was that of the weavers—as soon as they became conscious of their strength rebelled against the exclusive privileges of the patricians and succeeded in ousting them from power. The patricians relied upon the support of the French Crown, but the fatal battle of Courtrai (1302), in which the handicraftsmen laid low the chivalry of France, secured the triumph of the democracy. The power of the Flemish cities rose to its height during the ascendancy of Jacques van Artevelde (1285–1345), the famous citizen-statesman of Ghent, but after his downfall the mutual jealousies of the cities undermined their strength, and with the crushing defeat of Roosebeke (1382) in which Philip van Artevelde perished, the political greatness of the municipalities entered upon its decline.

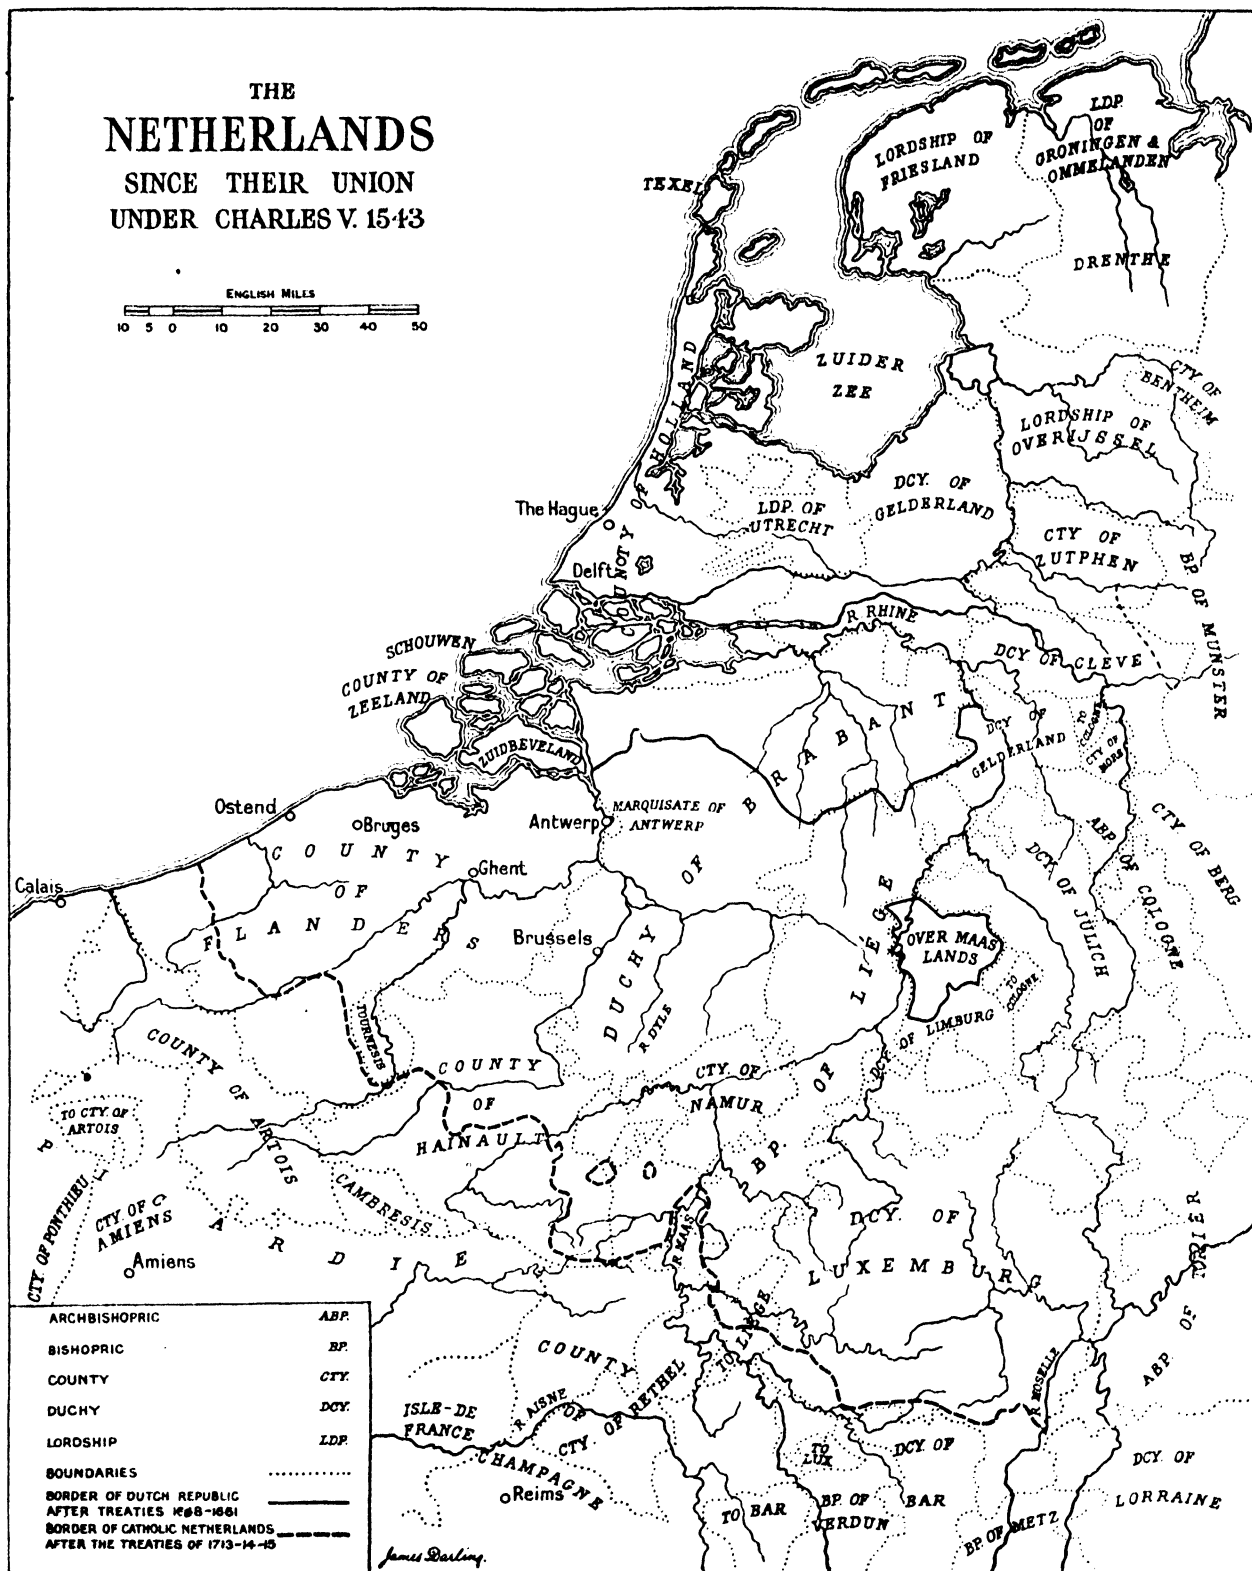

In Brabant—Antwerp, Louvain, Brussels, Malines (Mechlin)—and in the episcopal territory of Liège—Liège, Huy, Dinant—there was a more feeble repetition of the Flemish conditions. Flourishing communities were likewise to be found in Hainault, Namur, Cambrai and the other southern districts of the Netherlands, but nowhere else the vigorous independence of Ghent, Bruges and Ypres, nor the splendour of their civic life. In the north also the 13th century was rich in municipal charters. Dordrecht, Leyden, Haarlem, Delft, Vlaardingen, Rotterdam in Holland and Middelburg and Zierikzee in Zeeland, repeated with modifications the characteristics of the communes of Flanders and Brabant. But the growth and development of the northern communal movement, though strong and instinct with life, was slower and less tempestuous than the Flemish. In the bishopric of Utrecht, in Gelderland and Friesland, the privileges accorded Utrecht, Groningen, Zutphen, Stavoren, Leeuwarden followed rather on the model of those of the Rhenish "free cities" than of the Franco-Flemish commune.

THE BURGUNDIAN DOMINION

Consolidation of Power.—It was at this time that Flan-

ders, and gradually the other feudal States of the Netherlands, by marriage, purchase, treachery or force, fell under the dominion of the house of Burgundy. The foundation of the Burgundian rule in the Netherlands was laid by the succession of Philip the Bold to the counties of Flanders and Artois in 1384 in right of his wife, Margaret de Mâle. In 1404 Antony, Philip's second son (killed at Agincourt, 1415), became duke of Brabant by bequest of his great-aunt Joan. The consolidation of the Burgundian power was effected by Philip the Good, grandson of Philip the Bold, in his long and successful reign of 48 years, 1419-67. He inherited Flanders and Artois, purchased the county of Namur (1427) and compelled his cousin Jacqueline, the heiress of Holland, Zealand, Hainault and Friesland, to surrender her possessions to him in 1428. On the death, in 1430, of his cousin Philip, duke of Brabant, he took possession of Brabant and Limburg; the duchy of Luxemburg he acquired by purchase, 1443. He made his bastard son David bishop of Utrecht, and from 1456 onwards that see continued under Burgundian influence.

This extension of the Burgundian dominion implied the establishment of a strong monarchical authority. The dukes had united under their sway a number of provinces with different histories, institutions and languages, and their aim was to centralize their government. The nobility and clergy were on the side of the ducal authority; its opponents were the municipalities, especially those of Flanders. Their strength had been seriously weakened by the overthrow of Roosebeke, but Philip on his accession found them once more advancing rapidly in power and prosperity. He was quite aware that the industrial wealth of the great Flemish communes was financially the mainstay of his power, but their very prosperity made them the chief obstacle of his schemes of unifying into a solid dominion the loose aggregate of States over which he was the ruler. On this matter Philip would brook no opposition. Bruges was forced after strenuous resistance to submit to the loss of its most cherished privileges in 1438, and the revolt of Ghent was quenched in the "red sea" of Gavre in 1453. The splendour and luxury of the court of Philip surpassed that of any contemporary sovereign. A permanent memorial of it remains in the famous Order of the Golden Fleece, which was instituted by the duke at Bruges in 1430 on the occasion of his marriage with Isabel of Portugal, a descendant of John of Gaunt.

Before the accession of Charles, the only son of Philip, two important steps had been taken towards unification. The first was the appointment of a grand council with supreme judicial and financial functions, whose seat was finally fixed at Malines in 1473; the other the summoning of deputies of all the provincial "States" of the Netherlands to a States-general at Brussels in 1465. But Charles did not possess the qualities of a builder of States. At first all went well with him. By his ruthless suppression of revolts at Dinant and Liège he made his authority undisputed throughout the Netherlands. His campaigns against the French king were conducted with success. His creation of a formidable standing army, the first of its kind in that age of transition from feudal conditions, gave to the Burgundian power all the outward semblance of stability and permanence. But Charles, though a brave soldier and good military organizer, was neither a capable statesman nor a skilful general. At the very height of his power all his schemes of aggrandisement came to sudden ruin through a succession of disastrous defeats at the hands of the Swiss. At Nancy, Jan. 5, 1477, Charles was himself among the slain, leaving his only daughter, Mary of Burgundy, then in her 20th year, sole heiress to his possessions.

The catastrophe of Nancy threatened the loosely knit Burgundian dominion with dissolution. Louis XI. claimed the reversion of the French fiefs, and seized Burgundy, Franche Comté and Artois. But the Netherland provinces, though not loving the Burgundian dynasty, had no desire to have a French master. Deputies representing Flanders, Brabant, Hainault and Holland met at Ghent, where Mary was detained almost as a prisoner, and compelled her (Feb. 10, 1477) to sign the "Great Privilege." This charter provided that no war could be declared nor marriage concluded by the sovereign, nor taxes raised without the assent of the States; that natives were alone eligible for high office and that the na-

tional language should be used in public documents. The central court of justice at Malines was abolished, but the Grand Council was reorganized and made thoroughly representative. The Great Privilege was supplemented by provincial charters, the Flemish Privilege (Feb. 10), the Great Privilege of Holland and Zealand (Feb. 17), the Great Privilege of Namur and the *Joyeuse Entrée* of Brabant, both in May, thus curtailing the sovereign's power of interference with local liberties. On these conditions Mary obtained the hearty support of the States against France. Her marriage four months later to Maximilian of Austria was the beginning of the long domination of the house of Habsburg. The next 15 years were for Maximilian a stormy and difficult period. The duchess Mary died from the effects of a fall from her horse (March 1482), and Maximilian became regent (*mambourg*) for his son. The peace of Arras with France (March 1483) freed him to deal with the discords in the Netherland provinces, and more especially with the turbulent opposition in the Flemish cities. With the submission of Ghent (June 1485) the contest was decided in favour of the archduke, who in 1494, on his election as emperor, was able to hand over the country to his son Philip in a comparatively tranquil and secure state. Philip was 15 years of age, and his accession was welcomed by the Netherlands with whom Maximilian had never been popular. Gelderland, however, which had revolted after Nancy, had Charles of Egmont for its duke, and the two bishoprics of Liège and Utrecht were no longer subject to Burgundian authority. In 1496 Philip married Joanna of Aragon, who in 1500 became heiress apparent to Castile and Aragon, and she gave birth at Ghent to a son, afterwards the Emperor Charles V. On the death of Queen Isabel, Philip and Joanna succeeded to the crown of Castile and took up their residence in their new kingdom (Jan. 1506). A few months later Philip unexpectedly died at Burgos (Sept. 25). His Burgundian lands passed without opposition to his son Charles, then six years of age. (X.)

RELIGIOUS DIFFICULTIES

Charles V.—The emperor Maximilian, who was regent during the minority of his grandson, appointed his daughter Margaret, widow of Philibert duke of Savoy, as governor-general, an office which she held with varying success for eight years. In 1515, at the instance of the States-General, the 15-year-old Charles was suddenly declared of age. Born and brought up in the Netherlands he was personally popular there and the country was prosperous. Unfortunately, however, his accession brought the Netherlands into the huge and incongruous collection of states which the wars and marriages of the Habsburgs had heaped together. By the time he was 20 Charles was king of Aragon and Castile, with their Italian and American possessions, head of the house of Austria, and emperor. This meant first that he had to spend most of his life in his other dominions, leaving the Netherlands again to his aunt Margaret, and after her death (Nov. 27, 1530) to his sister Mary, the widow of that king of Hungary who had fallen at Mohacz. It meant also that he had to make large financial demands on these rich provinces for the purposes of his many wars. Opposition to the taxes led at last to one serious collision: the great city of Ghent resisted, and on Feb. 14, 1540, Charles entered it as a conqueror and humbled it by annulling its liberties and exacting a heavy fine. Another difficulty was the rapid growth of protestantism. A series of severe edicts against heresy was issued and enforced; but though many heretics were executed, every form of protestant belief continued to make converts. None of these dangers however, came as yet to a head. The rule of Charles and the "governresses" was on the whole moderate and successful. He rounded off the dominions by the purchase and subjugation of Friesland (1524), the annexations of the lands of the bishops of Utrecht (1528) and the defeat of an opponent who tried to establish himself in the duchy of Gelderland (1538). By 1543 he ruled over the 17 provinces which are usually meant by the name "Netherlands," though oddly enough there are several different ways of enumerating them. It is due not to any geographical or racial factors, but simply to the subsequent course of political history that there was no further expansion of the frontiers to the east or south. In the task of welding these

provinces together by constitutional links Charles made some headway, but not much. He made the rules of hereditary succession the same for all of them, so that they should never be divided among different heirs. He carried out a nominal, but in the result quite ineffective, incorporation of the provinces in the Holy Roman empire. He governed the provinces by executive councils of the type usual in the monarchies of the period, and, in addition to the provincial estates, he liked to summon, when he needed grants of money, States-General such as his predecessors had sometimes used. These stood, however feebly, for the principle of the unity of the Netherlands.

Philip II.—Conflict was precipitated in the Netherlands under Philip II., who succeeded his father on his abdication in 1555. In the first 12 years of his reign all the latent quarrels burst out. In 1559 the Peace of Cateau Cambrésis (a town better known now as Le Cateau) removed the pressure of war with France, and so cleared the way for the Dutch revolt and for the French wars of religion. As Philip was not emperor and ceased to be king of England on the death of his wife Queen Mary in 1558, the Netherlands now belonged to a combination of states, in which no other part was infected with protestantism: the religious struggle there was consequently more uncompromising than in Germany. Philip was determined to crush heresy. His policy was in a sense no more harsh than that of Charles; but as protestantism grew its repression caused greater discontent. Philip began, but never completed, the carrying out of a scheme which had been for some time in contemplation for rectifying the anomalies of the boundaries of the episcopal sees, and for making smaller dioceses with a more efficient episcopate. This not only intensified the fear of persecution, but alienated the greater nobles.

Prelude to the Revolt.—These religious questions would not by themselves have led to a revolution. The most powerful class in the Netherlands were the great nobles, from whom the "stadholders" or lieutenants of the provinces were chosen, and on whom the privileged order of the Golden Fleece was often conferred. Among these there was a widespread feeling against Spanish rule, and a desire to subordinate the power of the king's ministers to their own and that of the estates. The period from 1559 (when Philip departed to Spain) to 1567, during which the governor-general was the king's illegitimate half-sister Margaret duchess of Parma, is known as the prelude to the revolt. Its first stage lasted till 1564. By this time the magnates, led by William of Orange (*see WILLIAM I., PRINCE OF ORANGE*), Egmont and Hoorn had succeeded in two things. They had brought about the withdrawal of the Spanish troops, and they had got rid of the minister Cardinal Granvelle, archbishop of the new see of Mechlin, whom they somewhat mistakenly blamed for most of their grievances. Margaret's decision to rely on co-operation with the magnates did not, however, promote real harmony. The religious troubles increased and led to a conflict between the Government and the chartered privileges of the towns and estates, in the course of which the magnates formulated demands for the summoning of the States-General and for government by councils of aristocratic composition. In the summer of 1565 a new element came forward. More than 300 of the lesser nobles or gentry signed the Compromise by which they undertook to help and protect one another against persecution and to put an end to the inquisition. They were actuated by religious conviction, not, like the magnates, by the tolerance of the man of the world, and there were many among the rich burghers who were prepared to back up this determined party. On April 5, 1566, the signatories presented to Margaret a petition called the Request. On this occasion a nobleman contemptuously referred to them as beggars (*gueux*). They adopted this nickname and wore as badges the curious medals with a beggar's wallet which may still be seen in museums. Margaret made an ambiguous concession to their demands; but the result was only to precipitate the conflict (*see GUEUX, LES*). Extreme Calvinists and religious fanatics of all sects redoubled their activity. Field-preaching spread like wildfire and became something very little different from rebellion. In August many places, especially Antwerp, were alarmed by formidable riots for

the smashing of the images, altars, pictures and painted windows of the churches. The Calvinist burghers and gentry were forming armies and preparing to defend the towns where they were most influential. The general confusion, however, caused many of their adherents to fall away and most of the magnates to rally to the Government. William of Orange, by attempting to mediate, lost the confidence of both sides. Margaret raised a considerable force of German mercenary troops, which took possession of Valenciennes and Tournay and destroyed the ill-organized rabble of Calvinists in West Flanders and before Antwerp.

The troubles had reached a stage in which there was to be no more mercy or hesitation on the side of the Government; but the only one of the discontented magnates who grasped this was William of Orange, who departed to his German estates in April 1567. The veteran Spanish general the duke of Alva was already on the march from Italy with a model force of about 10,000 men.

THE REVOLT OF THE NETHERLANDS

Alva's rule, from 1568 to 1573, is the classical example of military despotism. Margaret resigned soon after his arrival: Egmont and Hoorn had already been arrested. An illegal tribunal, the Council of Troubles, nicknamed the Council of Blood, was set up to try those who had taken part in the disturbances. There were wholesale executions. Crowds of refugees fled by sea and land. Orange was outlawed (Jan. 24, 1568) and his estates confiscated; his eldest son and heir, a student at Louvain, was kidnapped and carried away to Spain. The father meanwhile, acting in his capacity as a sovereign prince and making war nominally only on Alva, not on his master Philip, had raised an army in Germany which was led by his brother Louis of Nassau into Friesland. Here it won a fight at Heiligerlee (May 23); but at Jemgum or Jemmingen it was completely defeated on July 21 by Alva in person. Before setting out from Brussels he had struck a characteristic blow. Egmont and Hoorn and 20 other nobles had been beheaded. In September Orange appeared with another army; but Alva, avoiding battle, starved him back into Germany. He was now undisputed master in the Netherlands and settled down to the military, ecclesiastical, judicial and other measures which were needed to consolidate his success. These measures caused subterranean discontent and was growing opposition.

Campaigns of 1572-73.—In 1572 affairs took a new turn. William had been in the habit of granting to some of his followers commissions to act as privateers. These fierce sea-rovers, the Sea-Beggars (*gueux de mer*) had committed many depredations on commerce and had not abstained from cruelties, especially against priests, but they had had to operate from foreign parts, such as England or East Friesland. Now, on April 1, 1572, they seized the port of Brill, at the mouth of the Maas. Soon after this they took Flushing, which commands the other great waterway, the Scheldt. Henceforth the rebels had a foothold of their own in the Netherlands. In comparison with this great fact it was of minor importance, though few saw it at the time, that an almost simultaneous movement of rebellion in the southern provinces was overpowered. William's brother Louis met with disaster in his seizure of Mons, from which the promised help of the French Huguenots was cut off by the massacre of St. Bartholomew. The co-operating army of William failed as his other armies had failed. Within three months of the capture of Brill Amsterdam was the only town still remaining to the Spaniards in the province of Holland. The States of Holland assembled and put the finances and administration of the rebels on a sound footing. When the south fell away after his and Louis's failure, William took up his residence at Delft. He had been converted to Lutheranism at an earlier stage, but was soon to throw in his lot with the Calvinists of Holland. Alva moved northwards to stamp out the rebellion. At Mechlin there were three days of butchery. The duke's son Don Frederick de Toledo sacked Zutphen and massacred the whole population of Naarden. But a new element was making its appearance in history: the burghers began to show a heroism with which the Spaniards could not cope. Haarlem held out all through the winter. On July 12, 1573, it surrendered: the townsfolk were spared, but the garrison, except the German merce-

naries, were killed to a man. At Alkmaar victory began: the dikes were cut and Don Frederick withdrew his army before the advancing inundations. In October Alva's fleet was defeated on the Zuider Zee and the admiral captured. On land his troops were unpaid and mutinous; he had lost the confidence of the king; on Dec. 18 he left Brussels, having served the master as badly as he had served the subjects.

Requesens.—His successor, Don Luis de Requesens, grand commander of Castile, arrived in Nov. 1573. Both sides were now ready for compromise. The south was suffering from the maritime war, but the north insisted on freedom of religious belief and the negotiations which were begun broke down in July 1574. Meanwhile the war had gone on, with serious reverses for the rebels but on the whole in their favour. In Feb. 1574 the fall of Middleburg ended the hold of the Spaniards on Zeeland; but on March 14 Louis of Nassau was defeated and killed at Mook Heath near Nijmegen. The siege of Leyden was a turning-point. After enduring every extremity the town was at last relieved on Oct. 3 by ships which crossed the flooded countryside. This triumph was commemorated by the foundation of the university which soon made Leyden one of the famous places of the world. During the summer support had been falling away from the inefficient Requesens: only Hainault, Artois and Namur appeared at a meeting of the States-General. On the other hand the north set about strengthening its organization. Holland and Zeeland made an agreement for union, and entrusted William of Orange, their stadholder, with the command of the naval and military forces and the final appointment to all political and judicial offices and to vacant city magistracies.

The fighting was still not uniformly favourable to the north. In October the Spaniards Mondragon and Ulloa began the reconquest of the islands of Duiveland and Schouwen in Zeeland. But this availed little. On March 5, 1576, Requesens died and the council of state took over the Government. The fighting in Zeeland had used up all the money, so in July the troops there mutinied and marched into Brabant where they established themselves at Alost. Popular opinion turned against the council of state. The States of Brabant had troops in their service, and on Sept. 5 these arrested the members of the council in the name of the States, though not by their order.

The Pacification of Ghent and Its Failure.—William of Orange saw the chances of the moment and, with a picked body of troops, advanced into Flanders, occupied Ghent and entered into negotiations with the States-General. His overtures were favourably received, the council at Brussels was dissolved, and a conference was opened at Ghent on Oct. 19. While it was at work the news came of the Spanish Fury at Antwerp. On Oct. 3 the mutinous troops had marched thither from Alost, had overpowered the garrison and had sacked the greatest city of the Netherlands with barbarous ferocity. This news silenced all differences among the Netherlands and on Nov. 8 there was signed the Pacification of Ghent.

This marked in a sense the zenith of the revolt; but the nobles of Brabant and Hainault were not under William's leadership, and the religious articles left the way open for a later split. The first problem was that of Don John of Austria. This famous man, bastard brother of the king and victor of Lepanto, had been appointed governor and had arrived at Luxembourg on the day of the Spanish Fury. Orange opposed his recognition as governor and persuaded the States-General to recognize him only on condition that he should accept the Pacification. Negotiations led to a deadlock. At this crisis the hands of Orange and the patriotic party were greatly strengthened by a new compact, the Union of Brussels (Jan. 1577), which was signed by all the provinces represented in the States-General. This engaged its signatories to unite in ejecting the foreign soldiery, in carrying out the Pacification, in recognizing Philip's sovereignty, and at the same time in maintaining the charters and constitutions which the king on his accession had sworn to observe. It added the north-east to the area which had accepted the Pacification; many signatories were Catholics. Luxembourg was left outside it. Faced by this opposition, Don John had to yield, and on Feb. 12 he signed the Perpetual

Edict (ratified soon after by Philip) in which he accepted the programme of William of Orange, except that catholicism was to be maintained.

On May 1 Don John made his state entry into Brussels, but only to find that he had no real authority. He wrote to Philip: "The prince of Orange has bewitched the minds of all men. They keep him informed of everything and take no resolution without consulting him." In July with some Walloon troops Don John suddenly left Brussels for Namur. This was practically a renewal of civil war. It alienated the States-General and the southern aristocrats, and on Sept. 23 William of Orange triumphantly returned to Brussels after an absence of ten years.

The unanimity on which this triumph was based did not last long: in October the States-General repudiated him as their leader. The prospect of success ended unity. The growth of Calvinism alarmed the Catholics. At the secret invitation of the Catholic nobles of the south headed by the duke of Aerschot there arrived in Brussels the archduke Matthias, brother of the emperor, and afterwards emperor himself. He was 20 years of age. On Jan. 18, 1578, he assumed the title of governor, which he nominally held till 1581.

Alienation of the South.—Philip, now thoroughly alarmed, sent Alexander Farnese with a veteran force of 20,000. With these Don John at Gemblours near Namur routed the rebel army. He became master of Louvain, Judoigne, Tirlemont, Aerschot, Bouvignes, Sichem, Nivelles, Roeux, Soignies, Binch, Beaumont, Walcourt, Maubeuge and Chimay. The discontent Catholics now turned from Matthias to the duke of Anjou, formerly Alençon, who had invaded the Netherlands with a French force and seized Mons. At the same time John Casimir, brother of the elector palatine, at the invitation of the Calvinist party and with the secret financial aid of Queen Elizabeth, entered the country at the head of a body of German mercenaries from the east. In Ghent under his protection there were Calvinist excesses which alienated the southern Catholic nobles, the States-General and the town patricians. Orange prevailed on Anjou to accept the title of "Defender of the liberties of the Netherlands," and Anjou promised, if the provinces would raise an army of 10,000 foot and 2,000 horse, to come to their aid with a like force. John Casimir and Anjou both left the Netherlands in the winter of 1578-79, the latter to return at a later stage of events. Meanwhile Don John had aroused the distrust of Philip by his dreams of invading England and marrying Mary Queen of Scots, and Philip cut off supplies. Don John died on Oct. 1, 1578.

On Jan. 5, 1579, the deputies of Hainault, Artois, Douai, formed themselves into a league for the defence of the Catholic religion, and, subject to his observance of the political stipulations of the Union of Brussels, professed loyal allegiance to the king. This league of Arras called forth the answering protestant Union of Utrecht, the work of John of Nassau. Both were nominally under the Pacification of Ghent, but the signatories were cleanly divided by religion. At this point it is convenient to end the narrative of the history of the Netherlands, treating henceforth as separate political units the obedient provinces of the south and the seven northern provinces which had already as good as won their independence and were to maintain it as a republic. (See BELGIUM: *History*, and HOLLAND: *History*.)

BIBLIOGRAPHY.—The best short general accounts in English are G. Edmundson, *History of Holland* (1922) and the same writer's chapters in *Cambridge Modern History*, vol. i. c. xiii. (1902), vol. iii. c. vi. and vii. (1904): both works have bibliographies. For original authorities and books in the Dutch language see the excellent lists in I. H. Gosses and N. Japikse, *Handboek tot de staatkundige geschiedenis van Nederland* (The Hague, 1920), which is the best handbook, and P. J. Blok, *History of the People of the Netherlands*, 5 vols. (1898-1912), the standard work for the northern provinces; that for the southern is H. Pirenne, *Histoire de Belgique*, vols. i.-vii. (3rd ed., 1909-26) to which the same author's *Bibliographie de l'histoire de Belgique* is a companion. For the earlier part of the period E. Armstrong, *The Emperor Charles V.*, 2 vols. (2nd ed., London, 1910), is valuable. J. L. Motley, *The Rise of the Dutch Republic*, 3 vols. (1856 and many subsequent editions) is a classical work and still a popular favourite. Ruth Putnam, *William the Silent* (1911) is a brief modern biography; F. Rachfahl, *Margaretha von Parma* (Munich, 1898), an excellent work of the same class; the

same author's *Wilhelm von Oranien und der niederländische Aufstand*, 3 vols. (The Hague, 1906-24) is a minute study of the period down to 1569. (G. N. C.)

NETHERLANDS OVERSEA TRUST: see RATIONING (BLOCKADE).

NETHERSOLE, OLGA (1863-), English actress, of Spanish descent, was born in London, and made her stage début at Brighton in 1887. In 1888 she played with John Hare at the Garrick, London, and, after other engagements, in 1894 took the Court Theatre on her own account. She was manager at His Majesty's (1898), at the Adelphi (1902) and at the Shaftesbury (1904). She took the Théâtre Bernhardt, Paris, in 1907, appearing herself in leading rôles. She toured in Australia and America, playing leading parts in modern plays, notably Clyde Fitch's *Sapho* (produced in London in 1902). Miss Nethersole worked during the World War on various Red Cross organizations.

NETHINIM, the name given to the members of a class of assistants in the service of the temple of Jerusalem. In the Old Testament they are specially mentioned, and thus designated, only by the compiler of Chronicles-Ezra-Nehemiah (3rd century B.C.). The name means "given" or "dedicated," i.e., to the temple; cf. Num. iii. 9, viii. 19, where the same term is applied to the Levites. In 1 Esdras and Josephus they are called *ἱερόδοκοι*, as are also the Levites in 1 Esdras i. 3. In the census lists compiled by the Chronicler, where a complete classification is desired, we find the order: Levites, singers, porters, Nethinim, e.g., in Ezra ii. Of these classes, the first three are of equal rank; the singers and porters are Levites (1 Chr. ix. 2, Neh. xi. 3, 15-18, xiii. 22, etc.), though sometimes expressly distinguished from them, when the special duties of the several orders are thought of (2 Chr. xxxv. 15, Ezra ii. 70, etc.). In the time of the Chronicler the Nethinim were free men and members of the Israelite community. They were registered by families and were exempt from taxation. Like the priests and Levites they served in rotation, being assigned to a certain portion of Jerusalem (Ophel), and also to neighbouring Levitical cities or villages. In Neh. x. 29 seq. they join in the solemn covenant, promising among other things not to intermarry with "the peoples of the land."

It is generally supposed, and not without good reason, that the Nethinim had their origin in a class of foreign menials (slaves) employed in the temple. In the time of the Chronicler it was customary to describe the Nethinim as "those given by David for the Levitical service" (Ezra viii. 20), and similar to this is the designation of one portion of them as the "children of Solomon's servants" (Ezra ii. 55, Neh. vii. 57, xi. 3). (C. C. T.)

NETLEY, a village in Hampshire, England, 3 m. S.E. of Southampton, and on a branch of the S.Rly. Pop. of ecclesiastical district (1921) 1,396. A Cistercian abbey was founded in 1237 by Henry III.; its ruins include a great part of the cruciform church, abbot's house, chapter house and domestic buildings. The style is Early English and Decorated. The gatehouse was transformed into a fort in the time of Henry VIII. Netley Hospital for wounded soldiers, built after the Crimean War is one of the principal military hospitals in Great Britain.

NETSCHER, GASPAR (1639-1634). German portrait and genre painter, was born at Heidelberg in 1639. As a boy he was adopted by a physician named Tullekens, who placed him under an artist named de Koster, and afterwards under Ter Borch. He then went to Italy, but finally settled at Bordeaux, where he made a living by painting the small cabinet pictures which are now so highly valued on account of their exquisite finish. After removing to The Hague, he turned his attention to portrait-painting, which proved more lucrative. His sons Constantyn (1668-1722), and Theodorus (1661-1732), were also painters after their father's style, but inferior in merit.

NETTLE, the common name for the plants of the botanical genus *Urtica*, which gives its name to the family Urticaceae. It contains about 30 species found in the temperate parts of both hemispheres. They are herbs covered with stinging hairs, and with very small, greenish, unisexual flowers on the same or on different plants. The stinging hairs consist of an elongated tubular cell the extremity of which is finely pointed. By this point the hair

penetrates the skin, breaks off and its contents pass out. The fluid contains formic acid and has a temporary irritant effect. Nettle tops, or the very young shoots of the nettle, may be used as a vegetable like spinach; but from the abundance of crystals (*cystoliths*) they contain they are apt to be gritty. The fibre furnished by the stems of several species is used for cordage or paper-making. Three species of nettle are wild in the British Isles: the common or great nettle (*U. dioica*), which is a hairy perennial with staminate and pistillate flowers in distinct plants; the small nettle (*U. urens*), which is annual and, except for the stinging hairs, glabrous, and has staminate and pistillate flowers in the same panicle; and the Roman nettle (*U. pilulifera*), an annual with the pistillate flowers in rounded heads, which occurs in waste places in the east of England, chiefly near the sea—the most virulent British species.

In North America, where the small nettle has become naturalized across the continent and the great nettle, from Newfoundland to Colorado and southward, there are several native nettles. Among these are the tall nettle (*U. gracilis*), found across the continent northward; the weak nettle (*U. chamaedrioides*), of the south-eastern States; the hoary nettle (*U. holosericea*), found from Idaho and Washington to Lower California, and the California nettle (*U. californica*). Closely allied are the wood nettle (*Laportea canadensis*), of the eastern United States, and the western nettle (*Hesperocnide tenella*), of California.

NETTLERASH, the popular English name for urticaria (*q.v.*), a disorder of the skin resembling the effect produced by the sting of a nettle and attended with great irritation. It occurs either in acute or chronic form. In America the corresponding term is "hives."

NETTLESHIP, HENRY (1839-1893), English classical scholar, was born at Kettering on May 5, 1839. He was educated at Lancing, Durham and Charterhouse schools, and Corpus Christi college, Oxford. He was a master at Harrow and later professor of Latin at Oxford, where he died on July 10, 1893. He specialized in the study of Virgil. After Conington's death in 1869, he saw his edition of Virgil through the press, and revised and corrected subsequent editions. In 1887 he published some of the results of 12 years' labour on a Latin lexicon (never completed) in a volume entitled *Contributions to Latin Lexicography*. The second series of his *Lectures and Essays*, published in 1895, and edited by F. Haverfield, contains a memoir by Mrs. M. Nettlehip, with full bibliography.

NETTLESHIP, RICHARD LEWIS (1846-1892), English philosopher, was born on Dec. 17, 1846, and educated at Uppingham and Balliol college, Oxford. He won the Hertford scholarship, the Ireland, the Gaisford Greek verse prize, a Craven scholarship and the Arnold prize, but took only a second class in Litterae Humaniores. He became fellow and tutor of his college and succeeded to the work of T. H. Green, whose writings he edited with a memoir (1880). His philosophy was idealistic and Hegelian. He died on Aug. 25, 1892, from the effects of exposure on Mont Blanc, and was buried at Chamonix.

Besides his edition of Green's works, Nettlehip published *The Theory of Education in Plato's Republic* (1880). His *Philosophical Lectures and Remains* were edited by A. C. Bradley (1897, 2nd ed., 1901), the *Lectures on the Republic of Plato* being printed separately in 1898 (2nd ed., 1901).

NETTLE TREE, the name applied to certain trees of the genus *Celtis*, belonging to the elm family (Ulmaceae). The best-known species have usually obliquely ovate, or lanceolate leaves, serrate at the edge, and marked by three prominent nerves. The flowers are inconspicuous, with a 4- or 5-parted perianth, as many stamens, a hairy d'sk and a 1-celled ovary with a 2-parted style. The fruit is succulent, like a little drupe, a character which serves to separate the genus alike from the nettles and the elms, to both of which it is allied. *C. australis* is a common tree, both wild and planted, throughout the Mediterranean region extending to Afghanistan and the Himalayas; it is also cultivated in Great Britain. It is a rapidly growing tree, from 30 to 40 ft. high, with a remarkably sweet fruit, recalling a small black cherry, and was one of the plants to which the term "lotus" was applied

by Dioscorides and the older authors. The wood, which is compact and hard, is used for a variety of purposes. *C. occidentalis*, a North American species, is the hackberry (*q.v.*).

NEU-BRANDENBURG, a town of Germany, in the republic of Mecklenburg-Strelitz, on the lake called Tollense See, 58 m. W.N.W. of Stettin by rail. Pop. (1925) 13,826. Neu-Brandenburg was founded in 1248, and has belonged to Mecklenburg since 1292. It is partly surrounded with walls, and possesses four old Gothic gates, dating from about 1300. The principal buildings are the Marienkirche, a 13th century Gothic building, the former grand ducal palace, and the palace of Belvedere.

NEUBREISACH: see NEUF-BRISACH.

NEUBURG, a town in the republic of Bavaria, situated on the Danube 12 m. W. of Ingolstadt by rail. Pop. (1925) 7,564. Neuburg was originally an episcopal see. In the 10th century it passed to the counts of Scheyern, and through them to Bavaria, being ceded to the Rhenish Palatinate in 1507. From 1557 to 1742 it was the capital of a small principality ruled by a cadet branch of the family of the elector palatine of the Rhine. In 1742 it was united again with the Rhenish Palatinate, with which it passed in 1777 to Bavaria. Its most important building is the old residence of its princes, in 16th century Renaissance style.

NEUCHÂTEL (Ger. *Neuenburg*), one of the cantons of western Switzerland, on the frontier towards France. It is the only Swiss canton that is situated entirely in the Jura, of which it occupies the central portion (its loftiest summit is the Mont Racine, 4,731 ft. in the Tête de Rang range). The canton has a total area of 305 sq.m., of which more than three quarters are reckoned "productive." It consists, for the most part, of the longitudinal ridges and valleys characteristic of the Jura, while its drainage is very unequally divided between the Thièle or Zihl, and the Doubs, which forms part of the north-west boundary of the canton, and receives only the streams flowing from the Le Locle and La Chaux de Fonds valley. Three regions make up the territory. That stretching along the shore of the lake is called *Le Vignoble* (from its vineyards) and extends from about 1,500 ft. to 2,300 ft. above the sea-level. An intermediate region is named *Les Vallées*, for it consists of the two principal valleys of the canton (the Val de Ruz, watered by the Seyon, and the Val de Travers, watered by the Arcuse) which lie to a height of about 2,300 ft. to 3,000 ft. above the sea-level. The highest region is known as *Les Montagnes*, and is mainly composed of the long valley in which stand the industrial centres of La Chaux de Fonds (*q.v.*), and Le Locle (*q.v.*) to which must be added those of La Sagne, Les Ponts and Les Verrières, the elevation of these upland valleys varying from 3,000 ft. to 3,445 ft. The canton is well supplied with railways, the direct line from Berne past Kerzers (Chiètres), Neuchâtel, the Val de Travers and Les Verrières to Pontarlier for Paris passing through it, while La Chaux de Fonds is connected by a line past Le Locle with Morteau in France. Other lines join the capital, Neuchâtel, to La Chaux de Fonds, as well as to Yverdon at the south-west extremity of the lake, and to St. Blaise at its north-east end.

In 1920 the population was 131,431 (estimated [1925] 126,560), of whom 111,199 were French-speaking, 16,064 German-speaking and 3,393 Italian-speaking, while 109,949 were Protestants, 18,623 Roman Catholics and 987 Jews. There are three "established and state-endowed" churches, the National Evangelical, the Roman Catholic and the Old Catholic (this sect in La Chaux de Fonds only), while the pastors of the Free Evangelical church and of the Jews (mostly in La Chaux de Fonds) receive special privileges.

Besides the capital, Neuchâtel (*q.v.*), the chief towns are La Chaux de Fonds, Le Locle and Fleurier, the principal village in the Val de Travers.

The most valuable mineral product is asphalt, of which there is a large and rich deposit in the Val de Travers. The wine of the Vignoble region is plentiful. Absinthe is manufactured in the Val de Travers. The most characteristic industry is that of watch-making, which is chiefly carried on (since the early 18th century) in the highland valleys of La Chaux de Fonds and of Le Locle, as well as at Fleurier in the Val de Travers.

The canton is divided into 6 administrative districts, which comprise 63 communes. In 1927 the legislature or *Grand Conseil* consisted of members elected in the proportion of one to every 1,200 of the population and holds office for three years, while since 1906 the principles of proportional representation obtain in these elections. The executive or *Conseil d'État* is elected by the people by secret ballot to hold office for three years. Since 1882 there have been 5 members. The members of the federal *Conseil des États* are named by the *Grand Conseil* and hold office for one year.

History.—We first hear of the *novum castellum* (Neuchâtel) in the will (1011) of Rudolf III., the last king of Burgundy, on whose death (1032) that kingdom reverted to the empire. About 1034 the emperor Conrad II. gave this castle to the lord of several neighbouring fiefs, his successors establishing themselves permanently there in the 12th century and taking the title of "count." In 1288 the reigning count resigned his domains to the emperor Rudolf, who gave them to the lord of Châlon-sur-Saône, by whom they were restored to the count of Neuchâtel on his doing homage for them. This act decided the future history of Neuchâtel, for in 1393 the house of Châlon succeeded to the principality of Orange by virtue of a marriage contracted in 1388. The counts gradually increased their dominions, so that by 1373 they held practically all of the present canton, with the exception of the lordship of Valangin which was held by a cadet line of the house till bought in 1592. In 1532 the title of "prince" was taken by the reigning count, while by the treaty of Westphalia (1648) the principality became sovereign and independent of the empire. In 1707 the Longueville house of Neuchâtel also became extinct, and a great struggle arose as to the succession. Finally the parliament (states) of Neuchâtel decided in favour of Frederic I., the first king of Prussia. The nominal rule of the Prussian king (for the country enjoyed practical independence) lasted till 1857, with a brief interval from 1806 to 1814, when the principality was held by Marshal Berthier, by virtue of a grant from Napoleon. In 1814 its admission into the Swiss confederation was proposed and was effected in 1815, the new canton being the only non-republican member, just as the hereditary rulers of Neuchâtel were the last to maintain their position in Switzerland. This anomaly led in 1848 to the establishment (attempted in 1831) of a republican form of government, brought about by a peaceful revolution led by A. M. Piaget. A royalist attempt to regain power in 1856 was defeated, and finally, after long negotiations, the king of Prussia renounced his claims to sovereignty, though retaining the right to bear the title of "prince of Neuchâtel." Thus in 1857 Neuchâtel became a full republican member of the Swiss confederation.

Piaget, *Documents inédits sur la Réformation dans le pays de Neuchâtel* (Neuchâtel, 1909); P. de Vargas, *L'Afrique de Neuchâtel 1856-57* (Lausanne, 1913); A. Chapuis, *Histoire de la Pendulerie neuchâteloise* (1917); A. Piaget, *Histoire de la Révolution neuchâteloise* vol. I. (Neuchâtel, 1919). See also *Musée Neuchâteloise* published by the Neuchâtel Société Cantonale d'Histoire 1864 etc.; and the second series of publications, 1923.

NEUCHÂTEL, capital of the above Swiss canton, situated near the north-east corner of the lake of Neuchâtel. In 1920 it had 23,152 inhabitants (in 1850 only 7,727 and in 1870, 12,683), 17,620 being French-speaking and 4,506 German-speaking; there were 19,204 Protestants, 3,515 Roman Catholics, and 95 Jews. It is the meeting-point of several important railway lines. The older portion of the town is built on the steep slope of the Chaumont (3,855 ft.), and originally the waters of the lake bathed the foot of the slope. But the gradual growth of alluvial deposits, and more recently the artificial embankment of the shore of the lake, have added much dry ground, and on this site the finest modern buildings have been erected. The 16th century castle and the 13th century collegiate church of Notre Dame (now Protestant) stand close together, and were founded in the 12th century when the counts took up their permanent residence in the town, to which they granted a charter of liberties in 1214. Among the buildings on the quays are the Musée des Beaux Arts (modern Swiss paintings and various historical collections, including that

of Desor relating to the Lake Dwellings), the Gymnase (in which are also the museum of natural history, with the fine collections of Agassiz, and the town library), the university and the École de Commerce. The town owes much to the gifts of citizens.

NEUCHÂTEL, LAKE OF. The lakes of Neuchâtel, Bienne and Morat, connected by canals, are survivors of a former great lake of the lower Aar valley. It is the largest lake wholly in Switzerland. Its total area is 92½ sq.m. (36½ sq.m. are in the Canton of Neuchâtel over 33 sq.m. in Vaud, 20½ sq.m. in Fribourg and in Berne 2 sq.m.). It is about 23½ m. long, from 3½ to 5 m. wide, its greatest depth is 502 ft., while its surface is 1,427 ft. above sea level. The Thièle or Zihl river enters at its south-western end and issues from it at its north-eastern end, but it also receives the Areuse (N.W.), Seyon (N.W.) and the Broye (N.E.). On the south-eastern shore the picturesque and historic little town of Estavayer is the chief place. At the south-western extremity of the lake is Yverdon (the *Eburodunum* of the Romans and the residence of Pestalozzi, 1806–1825). Far more populated is the north-western shore, where from south-west to north-east, we find Grandson, Cortaillod, Serrières and Neuchâtel itself. On the north shore is La Tène.

NEUENDORF: see NOWAWES.

NEUF-BRISACH or **NEUBREISACH**, a town of France in the department of Haut-Rhin on the Rhine-Rhone canal, 12 m. E. from Colmar by the railway to Freiburg. Pop. (1926) 1,775. Neuf-Brisach is a garrisoned fortress town founded by Louis XIV. in 1699 and fortified by Vauban. It was taken by the Germans on Nov. 10, 1870, and became French once more in 1918.

NEUFCHÂTEAU, a town of eastern France, in the department of Vosges at the confluence of the Meuse and the Mouzon, 49 m. W.N.W. of Épinal by rail. Pop. (1926) 3,845. The town, which is said to occupy the site of the Roman *Neomagus*, belonged in the middle ages to the dukes of Lorraine, ruins of whose château are still to be seen. In 1641 it passed to France. The churches are those of St. Christopher (13th and 15th centuries) and St. Nicholas, the latter combining the Romanesque and Gothic styles and built above a Romanesque crypt.

NEUHOF, THEODORE STEPHEN, BARON VON (c. 1690–1756), German adventurer and for a short time nominal king of Corsica, was a son of a Westphalian nobleman and was born at Cologne. Educated at the court of France, he served first in the French army and then in that of Sweden. Baron de Goertz, minister to Charles XII., realizing Neuhoof's capacity for intrigue, sent him to England and Spain to negotiate with Cardinal Alberoni. He returned to Sweden and then went to Spain, where he was made colonel and married one of the queen's ladies-in-waiting. Deserting his wife soon afterwards he repaired to France and became mixed up in Law's financial affairs; then he wandered about Portugal, Holland and Italy, and at Genoa he made the acquaintance of some Corsican prisoners and exiles, whom he persuaded that he could free their country from Genoese tyranny if they made him king of the island. With their help and that of the bey of Tunis he landed in Corsica in March 1736, where the islanders, believing that he had the support of several of the Powers, proclaimed him king. He assumed the style of Theodore I., issued edicts, instituted an order of knighthood, and waged war on the Genoese, at first with some success. But he was eventually defeated, and civil broils soon broke out in the island; the Genoese having put a price on his head and published an account of his antecedents, he left Corsica in Nov. 1736, ostensibly for foreign assistance. He returned to the island in 1738, 1739 and 1743, but the combined Genoese and French forces drove him out. Arrested for debt in London he regained his freedom by mortgaging his "kingdom" of Corsica, and subsisted on the charity of Horace Walpole and other friends until his death in London on Dec. 11, 1756.

See *Mémoires pour servir à l'histoire de la Corse*, by his son Frederick, also an English translation, both published in London in 1768. In 1795 he published a new edition on *Description of Corsica with an account of its union to the crown of Great Britain*. See also Fitzgerald, *King Theodore of Corsica* (1890); and Le Glay, *Théodore de Corse* (1907).

NEUILLY, TREATY OF. The Bulgarian treaty was

signed at Neuilly on Nov. 27 1919, and came into force on Aug. 9 1920. In the main it is the same as the Austrian treaty. But there were important differences in the military and naval clauses, and also in reference to reparation and finance.

The only serious territorial changes were to the west and south. The Serb-Croat-Slovene kingdom obtained several strategic ratifications. The two most important are that the Strumitsa salient in the extreme south-west has been flattened out, the western half being ceded to the Serbs; also, and more important, in the Nish-Pirot area the town of Tsaribrod has been taken from Bulgaria and a line drawn whereby an advance on Nish would be rendered more difficult. The frontier, however, confers no offensive advantage on the Serbs. A loss more serious in another sense is that to Greece of the district of Western Thrace, lying between Xanthi and the Maritsa river. This was ceded to Greece on her obtaining Eastern Thrace and Adrianople. Bulgaria, for ethnic reasons, received a slight extension of territory west of Adrianople. The expulsion of Greeks from Adrianople and East Thrace by the Turks did not, however, cause the Allies to change their minds about Western Thrace, which remains annexed to Greece and is denied to Bulgaria.

Bulgaria had always asserted claims to that part of Macedonia now in Serbian hands, and also to Eastern and Western Thrace. In the former area her ethnic pretensions are better founded than in the latter. But Serbian Macedonia is in the hands of a formidably armed and militarily strong nation. Greek Macedonia and Thrace are now populated by hundreds of thousands of Greek refugees from Asia, and contain over 80% of a purely Greek population. In population Bulgaria lost some 300,000 persons, of whom some are not Bulgars.

Part IV. The military, naval and air clauses have some special points. Bulgaria is allowed 20,000 regulars, 10,000 gendarmes and 3,000 frontier guards, or 33,000 in all. This number is insufficient to maintain order in a turbulent Balkan State, and the subsequent serious disturbances in Bulgaria are due directly to this fact. It is increased by the difficulty of applying the voluntary long-service system of 12 consecutive years to a nation of peasants. In an agricultural country it is practically impossible to get men to leave their farms for 12 years, and the army is always likely to be dangerously below strength, and the less regular formations dangerously above it. The naval clauses do not differ from those of the German or Austrian treaties. All Bulgaria's navy has now been destroyed, and she was left with four torpedo-boats, of which three were damaged, and six motor-boats, of which four were damaged.

Part V. (Prisoners of War and Graves) and

Part VI. (Penalties) are the same as in the Austrian treaty (see ST. GERMAIN, TREATY OF).

Part VII. (Reparation.) This contains the most novel and interesting feature of the treaty, and is, in fact, the only serious attempt to get reparation on to a business basis. It contained three features of great interest.

(a) Contrary to the practice in the German, Austrian and Hungarian treaties, there was no attempt made to seize or distribute the Bulgarian commercial fleet on the "ton-for-ton" or "class-for-class" principle.

(b) It fixed the amount to be paid at the lump sum of £90,000,000.

(c) It created a Reparation Commission consisting of French, British and Italian representatives with power to reduce this amount by a simple majority vote (not by unanimity as is the systematic rule), on the suggestion of the inter-allied Commission.

The general scope and powers of the Reparation Commission are drawn in such a manner as to control the finances of the country sufficiently to obtain reparation, without offensive interference. In the end, the Reparation Commission, after examining the question on the spot, has practically remitted three-quarters of the total of £90,000,000. The annual sum now required to meet the charges on the 550,000,000 gold francs of the debt is well within the capacity of the new Bulgarian State, and is being punctually paid. None of the remaining clauses of the Bulgarian treaty have any special features of interest or importance.

(See BULGARIA; PARIS, CONFERENCE OF; REPARATION, etc.)

NEUILLY-SUR-SEINE, a suburb of Paris, 8 kilometres north-west from Notre Dame, in the department of Seine. It is situated between the fortifications and the Seine. Pop. (1926) 50,528. A castle at Neuilly, built by the count of Aragon in the 18th century, ultimately became the property and favourite residence of the duke of Orleans (Louis Philippe), the

birthplace of nearly all his children, and the scene of the offer of the crown in 1830. The buildings were pillaged and burned by the mob in 1848. The park, which extended from the fortifications to the river, as well as the neighbouring park of Villiers (also belonging to the princes of Orleans), was broken up into building lots, and is occupied by many small middle-class houses and a few fine villas. The fine bridge, designed in the 18th century by Perronet, is noteworthy as the first level bridge constructed in France. The Galignani Institution, founded by the brothers Galignani for aged booksellers, printers and others, has accommodation for 100 residents. The manufactures include perfumery, chocolate, colours, varnish, automobiles, carpets; Neuilly is an engineering centre.

NEUMANN, FRANZ ERNST (1798–1895), German mineralogist, physicist and mathematician, was born at Joachimsthal on Sept. 11, 1798. Neumann's earlier papers on crystallography led to his appointment as Privatdozent at Königsberg, where in 1828 he became extraordinary, and in 1829 ordinary professor of mineralogy and physics. In 1831, from a study of the specific heats of compounds, he formulated "Neumann's law" (that "the molecular heat of a compound is equal to the sum of the atomic heats of its constituents"). Devoting himself next to optics, he produced memoirs which entitle him to a high place among the early searchers after a dynamical theory of light. In 1832, by the aid of a particular hypothesis as to the constitution of the ether, he reached results agreeing with those obtained by A. L. Cauchy, and succeeded in deducing laws of double refraction resembling those of A. J. Fresnel. He made contributions to the mathematical theory of electrodynamics, and in papers published in 1845 and 1847 established mathematically the laws of the induction of electric currents. His last publication was on spherical harmonics (*Beiträge zur Theorie der Kugelfunctionen*, 1878). He died at Königsberg on May 23, 1895.

NEUMANN (originally **BAMBERGER**), **KARL FRIEDRICH** (1793–1870), German orientalist, was born at Reichsmannsdorf, near Bamberg, on Dec. 28, 1793. He studied philosophy and philology at Heidelberg, Munich and Göttingen. From 1822 to 1825 he was a teacher at Spire; then he learned Armenian in Venice and visited Paris and London. In 1829 he went to China, where he amassed a library of about 12,000 valuable books and manuscripts, which he presented to the royal library at Munich. In 1831 Neumann became professor of Armenian and Chinese at Munich. In 1852 he was removed from his chair on account of his revolutionary views. He died in Berlin on March 17, 1870.

Neumann wrote *Geschichte des englischen Reichs in Asien* (Leipzig, 1851); *Geschichte der Vereinigten Staaten von Amerika* (Berlin, 1863–1866); *Versuch einer Geschichte der armenischen Literatur* (Leipzig, 1836); *Die Völker des südlichen Russland* (1846, and again 1855); and several translations from the Chinese. The journal of the Royal Asiatic Society (London, 1871) contains a full list of his works.

NEUMES, the signs employed in Western musical notation before the introduction of the staff. (Gr. *νεῦμα*, a sign). They were, in the first instance, merely rough expression marks placed over the words, to guide the singers of the plainsong melodies, the melodies themselves being learned by ear, and hence they gave no indication as to the pitch or time-relations of the notes. Gradually, however, they became more and more elaborate and precise, then their positions on the paper were varied to indicate pitch, though at first without the employment of lines; subsequently lines were introduced, and so, step by step, the whole present-day system was evolved. (See **MUSICAL NOTATION**.)

NEUMÜNSTER, a town in the Prussian province of Schleswig-Holstein, lies on the small river Schwale, 40 m. N. of Altona-Hamburg by rail, and at the junction of lines to Kiel, Vamdrup (Denmark) and Tönning. Pop. (1925) 39,851. The name, which was originally Wipendorp, is derived from an Augustine monastery, founded in 1130, and is mentioned as *novum monasterium* in a document of 1136. Its industrial importance began in the 17th century, when the cloth-workers of Segzeberg, a town to the south-east, migrated to it. It became a town in 1870. It is, after Altona, the most important industrial town in the province.

NEUNKIRCHEN or **OBER-NEUNKIRCHEN**, a town in the Prussian Rhine province, on the Blies, 12 m. N.E. of Saarbrücken by rail. Pop. (1925) 35,274, consisting almost equally of Protes-

tants and Roman Catholics. The town is first mentioned in 1280, and became important industrially during the 18th century. The principal industrial establishment is an iron-foundry. Around the town are important coal mines. The castle built in 1570 was destroyed in 1797.

NEUQUÉN, an inland territory of Argentina on the Chilean frontier, between the Colorado and Limay rivers, with the province of Mendoza on the north and the territory of Río Negro on the east and south. Area, 40,530 sq. m. Pop. (1914) 28,866. The greater part of the territory is mountainous, with fertile, well-watered valleys and valuable forests. The eastern part, however, contains large plains, showing only stunted vegetation, and having numerous saline deposits. Long droughts prevail in this region and there is no inducement for settlement, the nomadic Indians visiting it only on their hunting expeditions. Guanacos and Argentine hares are found in abundance in Neuquén, and to a lesser degree the South American ostrich. The Neuquén, which unites with the Limay near the 68th meridian to form the Río Negro, is the principal river of the territory. The largest of a group of beautiful lakes in the higher Andean valleys is the celebrated Nahuel-Huapi (Lion Grass), which is nearly 50 m. long from east to west and about 20 m. from north to south at its widest part, and which lies partly in the south-west angle of the territory, partly in Río Negro, and partly in the Republic of Chile. It is the source of the Río Limay and receives the overflow from two smaller neighbouring lakes. The temperature of the Andean region is cold even in summer, but on the lower plains it is hot in summer. The territory is reached by a light-draught river steamer which ascends the Río Negro to Ft. Roca at the confluence of the Limay and Neuquén, and by a branch of the Great Southern railway from Bahía Blanca to the same point. The population is concentrated in a few small towns on the rivers and in some colonies, in the fertile districts of the Andes. The capital is Neuquén, a small town on the river of the same name, in the mountainous district in the northern part of the territory.

NEURALGIA, a term generally used to indicate pain affecting a particular nerve or its branches from any cause. The existence of neuralgia usually betokens a depressed or enfeebled state of health. It is often found to affect the hereditarily rheumatic or gouty. In weakened conditions from improper or insufficient food, in anaemia from any cause, and in syphilis or malaria, neuralgia is a frequent concomitant. The pain is often localized, but may come to extend beyond the area of its first occurrence. It is usually paroxysmal, not unfrequently periodic; occurring at a certain time of the day or night, varies in intensity, and may be agonizing or less severe and tingling. Perverted nerve function may co-exist with or following neuralgia. Thus there may be hyperaesthesia, anaesthesia, paralysis or alterations of nutrition, such as wasting of muscles, whitening of the hair, etc.

The commonest forms of neuralgia are facial neuralgia or tic douloureux, intercostal neuralgia and sciatica.

Facial Neuralgia (or *tic douloureux*) affects the great nerve of sensation of the face (fifth nerve), and may occur in one or more of its three divisions. It is usually confined to one side. When the ophthalmic division of the nerve is involved the pain is mostly felt in the forehead and side of the head. It is often intensely sharp, cutting or burning, either constant or with exacerbations, and often periodic. The skin over the affected part is often red and swollen, and, even after the attack has abated, feels stiff and tender to the touch. In this, as in all forms of neuralgia, at certain localities the pain is more intense, these "painful points" usually being where the branches of the nerves emerge from bony canals or pierce the fascia to ramify in the skin. Hence, in this form, the greater severity of the pain above the eyebrow and along the side of the nose. There is also pain in the eyelid, redness of the eye, and flow of tears. When the maxillary division of the nerve is affected the pain is chiefly in the cheek and upper jaw, the painful points being immediately below the lower eyelid, over the cheek bone and about the upper lip. When the mandibular division of the nerve suffers the pain affects the lower jaw, and the chief painful points are in front of the ear and about the chin.

Intercostal neuralgia is pain affecting the nerves which emerge from the spinal cord and run along the spaces between the ribs to the front of the body. It affects the left side more than the right, is much more common in women than in men, and occurs generally in enfeebled states of health. It might be mistaken for pleurisy or some inflammatory affection of the lungs; but the absence of chest symptoms, its occurrence independently of respiration and other considerations establish the distinction. The specially painful points are chiefly at the commencement of the nerve as it issues from the spinal canal, and at the extremities towards the front of the body, where it breaks up into filaments which ramify in the skin. This form of neuralgia occasionally precedes or follows an attack of shingles (*Herpes zoster*).

Sciatica is another common form of neuralgia. It affects the great sciatic nerve which emerges from the pelvis and runs down the leg to the foot. It is often traceable to cold or damp, to over-use of the limbs in walking, etc. Any source of pressure upon the nerve within the pelvis, e.g., pregnancy, a tumour or even constipation, may excite an attack of sciatica. It is often connected with a rheumatic or gouty constitution. In general the nerve of one side only is affected. The pain which is felt at first a little behind the hip-joint steadily increases in severity and extends along the course of the nerve and its branches, perhaps, down to the toes. The specially painful points are about the knee and ankle joints; besides which a feeling of numbness is experienced throughout the whole limb. In severe cases all movement of the limb aggravates the pain, and the patient is obliged to remain in bed. In prolonged attacks the limb may waste and be drawn up and fixed in one position. Attacks of sciatica are often attended with great suffering, and are apt to be very intractable to treatment.

Treatment.—In the treatment of all forms of neuralgia it is of first importance to determine if possible any underlying cause. When the attack is periodic the administration of a large dose of quinine two or three hours previous to the usual time of the seizure will often mitigate, and may even prevent the paroxysm. Many topical applications are of great efficacy. Liniments containing opium, belladonna or aconite rubbed into the affected part will often soothe the most severe local pain. And antipyrin, phenacetin, aspirin and similar analgesics are commonly taken. The plan at one time resorted to of dividing or excising a portion of the affected nerve is now seldom employed, but the operation of nerve-stretching in some forms of neuralgia, notably sciatica, is sometimes successful. Such an operation is justifiable only in cases where other less severe measures have failed to give relief. Electricity proves serviceable in many instances. In the severest forms of tic douloureux complete relief has followed extirpation of the Gasserian ganglion. (F. W. Mo.)

NEURASTHENIA, a medical term for weakness of the nervous system. The symptoms may present themselves as follows: (1) general feeling of malaise, combined with a mixed state of excitement and depression; (2) headache, sometimes with the addition of vertigo, deafness and a transitory clouding of consciousness simulating *petit mal* or *migraine*; (3) disturbed and restless, unrefreshing sleep, often troubled with dreams; (4) weakness of memory, especially for recent events; (5) blurring of sight, noises or ringing in the ears; (6) variable disturbances of sensibility, especially scattered analgesia (partial and symmetrical) affecting the backs of the hands especially, and in women the breasts; (7) various troubles of sympathetic origin, notably localized coldness, particularly in the extremities, morbid heats, flushings and sweats; (8) various phenomena of nervous depression associated with functional disturbances of organs.

According to the complexity of symptoms, the neurasthenia is more particularly defined as cerebral, spinal, gastric and sexual. The cerebral form is sometimes termed *psychasthenia*, and is liable to present morbid fears or phobias, e.g., agoraphobia (fright in crowds), monophobia (fright of being alone), claustrophobia (fright of being in a confined place), anthropophobia (fright of society), batophobia (fright of things falling), siderodromophobia (fright of railway travelling). There may also be mental ruminations, in which there is a continuous flow of connected ideas from

which there is no breaking away, often most insistent at night and leading to insomnia. Sometimes there is arithmomania (an imperative idea to count). Such cases often exhibit a marked emotionalism and readily manifest joy or sorrow; they may be cynical, pessimistic, introspective and self-centred, only able to talk about themselves or matters of personal interest, yet they frequently possess great intellectual ability, and there is an absence of the insane ideas characteristic of melancholia.

Traumatic neurasthenia is the neurasthenia following shock from injury; it is sometimes termed "railway spine," "railway brain," from the frequency with which it occurs after railway accidents, especially in people of a nervous temperament. The physical injury at the time may be slight, so that the patient is able to resume work, but symptoms develop later which may simulate serious organic disease. As in all forms of neurasthenia, the subjective symptoms may be numerous and varied, whereas the objective signs are but few and slight. Many difficulties, therefore, present themselves in arriving at a sound opinion as to the future in such cases. "Shell-shock" (*q.v.*) is a modern variant of neurasthenia occasioned by war conditions. The treatment of neurasthenia is largely psychical and if carried out systematically is often very successful (*see* PSYCHOTHERAPY). (F. W. Mo.)

NEURITIS, a term denoting inflammation of nerve fibres. Two varieties are known, the localized and the multiple. The localized form frequently follows exposure to cold and may attack a single nerve. Facial paralysis (Bell's palsy) is commonly seen following a neuritis of the facial nerve. Neuritis may follow blows and wounds, stretching or long-continued pressure, as in a dislocation of the elbow joint, or the nerve may be involved in a neighbouring inflammation. The first symptom of a localized neuritis is boring pain along the course of a nerve and its distribution, the part being sensitive to pressure.

Multiple neuritis or polyneuritis may affect many of the peripheral nerves symmetrically and at the same time. For the pathological changes *see* NEUROPATHOLOGY. The causes may be divided as follows: (1) The toxins of acute infective diseases, such as diphtheria, influenza, typhoid fever, malaria, scarlet fever and septicaemia. (2) Acute or chronic poisoning by lead, arsenic, mercury, copper and phosphorus. (3) General disorders: gout, rheumatism, tubercle, carcinoma. (4) The local action of leprosy and syphilis. (5) Endemic disease: beri-beri (*q.v.*). (6) Alcohol, the most common. Alcoholic neuritis is a result of constant steady drinking, particularly of beer. It begins with numbness of the feet and later of the hands, then painful cramps in the legs appear and there is pain on moving the limbs, and superficial tenderness is occasionally present. In other cases the earliest symptoms are weakness of the legs and extreme fatigue, leading to a characteristic "steppage gait," or marked inco-ordination of movement may occur and the gait become ataxic. Trophic changes soon appear, early and rapid muscular wasting occurs, the skin becomes dry and glossy, the nails brittle and the hair thin. In time contractures take place, the hip and knee-joints become flexed and the foot dropped at the ankle. Should the case progress the patient may become bedridden and powerless, and degenerative mental changes may take place, loss of memory, irritability of temper and emotional instability. Early cases may recover completely under treatment. The galvanic and faradaic currents combined with massage are useful in helping to restore the wasted muscles, and hot-air baths and warm applications are appreciated.

Arsenical neuritis mostly affects the lower extremities, as contrasted with lead, which mainly paralyses the fingers and wrists; recovery is even slower than in alcoholic neuritis, the treatment being on the same lines, with the removal of the cause of the disease. In the neuritis of chronic lead poisoning a fine tremor of the hands is an early symptom and sensory symptoms are usually

absent; the muscles affected are the extensors of the wrists, thumb and fingers (*see* LEAD POISONING). The course of the disease is long, and an attempt should be made to eliminate the lead from the system by purgatives and the administration of potassium iodide.

In diabetic neuritis paraesthesia is slight, and the legs are chiefly affected; weakness and ataxia may be present. Trophic sores on the feet are of frequent occurrence in this variety. The treatment is that of the disease.

Post-diphtheric neuritis occurs in about 10% of all cases of diphtheria. Paralysis of the soft palate is the earliest, and may be the only symptom. The limbs are affected much later, usually about the fifth or sixth week. Atrophy of the muscles is frequently rapid. If the respiratory muscles are unaffected the prognosis is good, but the paralysis of the limbs may last for several months. The treatment is complete rest, good food and the administration of strychnine.

Acute polyneuritis with numbness and motor weakness has been noted after influenza, together with slight muscular wasting and electrical degeneration. Later, there is loss of sensation in the peripheral portion of the limbs, and the motor weakness may affect the muscles of the trunk and face. Such cases tend towards complete recovery.

NEUROPATHOLOGY, the general name for the science concerned with diseases of the nervous system. For the anatomy and physiology, *see* NERVE, NERVOUS SYSTEM, BRAIN, SPINAL CORD and SYMPATHETIC SYSTEM. The morbid processes affecting the nervous system are usually clinically divided into two great groups of (1) organic disease, (2) functional disturbance, depending on whether or not symptoms observed during life can be associated with recognizable changes after death. Knowledge of the first group is much more advanced than of the latter, for, given certain symptoms during life, we can, as a rule, predict not only the nature of the morbid process, but its particular locality.

The histological elements which make up the nervous system may also be divided into two groups: (1) the nervous units or neurones, (2) the supporting, protecting and nutrient tissues. Nervous diseases may start primarily in the neurones and cause their degeneration; such may bring about "diseases," or "syndromes" within the nervous system. The nervous units, however, may be affected secondarily by disease processes starting in the supporting, protecting and nutrient tissues within the nervous system; such include changes of the blood-vessels, lymphatics, membranes and the special nervous connective tissue, neuroglia (a residue of the embryonal structure from which the nervous system was developed). Tumours and new growths must also be included.

The causes of pathological processes occurring in the nervous units (neurones) may be divided into internal and external; in all cases except direct injury the two groups are generally more or less combined.

Internal Causes.—Of the factors involved in nervous disease hereditary predisposition may first be accented. In 70% of 150 cases of idiocy or imbecility in the London county asylums, Dr. Tredgold found a family history of insanity in some form or another. This predisposition may be convergent, paternal, maternal; from grandparents or even more remote ancestors. Moreover, no study of heredity is complete that does not take into consideration collaterals. Especially does this apply to functional neuroses, *e.g.*, epilepsy, migraine, hysteria and neurasthenia; and to psychoses, *e.g.*, delusional insanity, mania and melancholia, manic-depressive, recurrent or periodic insanity and dementia-præcox or adolescent insanity. Strictly speaking, it is the tendency to nervous disease rather than the disease itself that is inherited, and this is frequently spoken of as a neuropathic or

psychopathic taint.

EXTERNAL CAUSES

The external causes producing morbid changes in the nervous elements are: I. Abnormal conditions of the blood and lymph. II. Excess or deficiency of normal stimulation, or existence of abnormal stimulation. III. Injury or diseases of supporting, enclosing or vascular tissues.

Abnormal Conditions of the Blood and Lymph.—The essential causes of change in environment of the nervous elements (neurones) are: (1) Deficiency or absence of blood-supply to the nervous system in general (as after severe hæmorrhage), or to some particular portion, owing to local vascular disturbance or occlusion. (2) Alterations in the normal condition of the blood, due to (a) deficiency or absence of certain essential constituents, (b) excess of certain normal constituents, (c) the presence of certain abnormal constituents produced within the body, or entering it from without. All these act through the cerebro-spinal fluid, a special lymph secreted by the choroid plexus in the ventricles of the brain by which the neurones are bathed.

(1) *Quantity of Blood Supply.*—Syncope or fainting occurs when the blood supply suddenly fails to reach the higher centres of the brain; such may arise from sudden reflex arrest of the heart's action, or from localized spasms of the cerebral vessels. The effects of embolism and thrombosis are considered later.

(2) *Quality of Blood Supply.*—(a) Insufficiency of oxygen, as in anæmia, leads to functional depression, lassitude and mental fatigue. Impoverishment of the blood in women by frequent pregnancies and excessive lactation causes neuralgia, nervous exhaustion and may aid in the development of neurasthenic or hysterical reactions. The tendency of psychoneuroses and psychoses to occur and recur at menstrual and climacteric periods in women, indicates that these factors themselves are of periodic significance. These are connected with the reproduction function, rather than with the blood however. The most striking examples of the effect of absence or "sub-minimal" deficiency of a normal constituent of the blood upon the development and functions of the nervous system are afforded by cretinous idiots, who are born without thyroid glands, and whose brains never develop in consequence; and by those people who suffer from myxoedema (*q.v.*) occasioned by the absence of thyroxin or other products of the internal secretion of the thyroid gland. The proof of this is shown by the disappearance of the nervous phenomena, slowness of thought, slowness of speech, etc., after thyroxin or a preparation of the gland has been continuously administered. This is an excellent example of a reversible process.

(b) Excess of certain Normal Constituents in the Blood.—Excess of carbonic acid causes drowsiness, and probably in asphyxia is one of the causes of the convulsions. All the nitrogenous waste products are normal constituents of the blood; but should oxidation be incomplete, from disease of the liver, or should these substances accumulate in the blood, owing to inadequate function of the kidneys, uræmia may supervene, the manifestations of which are headache, drowsiness, unconsciousness or coma, epileptiform convulsions and sometimes symptoms of polyneuritis. Again, in Graves's disease (hyperthyroidism), nervous phenomena, in the form of exophthalmos, fine tremors, palpitation and mental excitement have by some authorities been explained by the excess of thyroid internal secretion, due to the enlargement and increased functional activity of the gland.

(c). The presence of abnormal constituents in the blood is a most important cause of disease of the nervous elements. These are: Poisons produced within the body (α) by perverted function of organs or tissues, auto-intoxication; (β) by the action of micro-organisms, protozoa and bacteria, upon the living fluids and tissues of the body; (γ) poisons introduced into the body from without.

(α) Poisons resulting from perverted Function of the Organs.—Nervous symptoms follow auto-intoxication by products of disordered digestion, fatigue products (*e.g.*, sarcocollactic acid in prolonged muscular spasm), excess of uric acid, phosphates, oxalates, sugar, bile, hepatic products as in acute yellow atrophy. In pernicious and certain grave anæmias, the degenerative changes in

the spinal cord found in some cases is due, chiefly, to some neuro-toxin, which probably arises from imperfect metabolism or absorption from the alimentary canal. In auto-intoxication, disease of one organ or tissue is apt to establish a vicious circle which is constantly enlarging; therefore nervous symptoms manifesting themselves in the course of a disease add much to the gravity of the complaint.

(β). Poisons produced by infective Micro-organisms.—Some of these have a general devitalizing influence by altering the blood and producing fever. In acute infectious diseases, delirium is a frequent complication; in severe cases, stupor and coma may occur, and in this extreme stage the nerve cells undergo an acute morbid bio-chemical change. These particular poisons may have marked selective toxic action upon particular parts of the nervous system.

Poisons may have a *selective influence* upon some part of the nervous system. The syphilitic organism and its poisons are most important factors in the production of two progressive degenerations of the nervous system—one affecting especially the afferent conducting tracts of the spinal cord, namely, tabes dorsalis (locomotor ataxia), and the other affecting especially the frontal and central convolutions of the cerebral hemispheres, namely, general paresis (general paralysis of the insane). When syphilis attacks the supporting, enclosing and nutrient vascular tissues, a predilection to affect structures about the base of the brain occurs, and paralyzes of the third nerve are frequent in this disease. Other examples occur in rabies, tetanus, diphtheria (q.v.).

Protozoa and Diseases of the Nervous System.—The relation of protozoa to the existence of widespread diseases affecting men and animals is becoming yearly of greater importance. Certain diseases in which the nervous system is profoundly affected are now explained by the invasion of the tissues of the body by these lowly organisms, for example, African sleeping sickness due to a special protozoan; Syphilis due to *Spirochaeta* or *Treponema pallida*; Malaria due to *Haematozoon malariae*.

The bacterial invasion of tissues is generally characterized by a migration of polymorpho-nuclear leucocytes, but protozoal invasion is characterized by a formative hyperplasia of the fixed cell tissues, endothelial, epithelial and conjunctival, and there is a close similarity in the defensive reaction of the tissues to all forms of protozoal invasion.

When the nervous system is affected a local or general chronic meningo-encephalitis is set up, characterized by a meningeal and perivascular infiltration with lymphocytes and plasma cells, occasioned by a chronic irritative process, presumably caused in the case of sleeping sickness for example by the presence of trypanosomes in the actual cerebro-spinal fluid. The same perivascular and meningeal infiltration with plasma cells and lymphocytes is found in syphilitic diseases of the nervous system.

Pathology of the Cerebro-spinal Fluid.—Pathological changes in the cerebro-spinal fluid are important in the diagnosis of nervous diseases. Normal cerebro-spinal fluid is clear like water; it has a specific gravity of 1.006 and resembles in its composition the blood minus its corpuscular and albuminous constituents. Being secreted by the choroid plexus, if any cause, such as tumour or meningitis, should interfere with its escape from the ventricles it gives rise by pressure to *internal hydrocephalus* and cerebral anaemia which may occasion epileptic convulsions and various degrees of drowsy stupor, lethargy, unconsciousness and even coma. Lumbar puncture has proved of some use in treatment, but is invaluable in the diagnosis of various diseases of the central nervous system. The fluid withdrawn should be centrifuged and the deposit examined microscopically if necessary after staining by suitable methods; the existence of cells indicates disease of the central nervous system. In general paresis, cerebro-spinal syphilis and tabes dorsalis even in early stages, the deposit consists almost entirely of lymphocytes. Some evidence of the progress of the disease and the effect of treatment may be obtained by counting the number of cells at different periods. In tuberculous meningitis there are also lymphocytes in abundance; tubercle bacilli cannot readily be found, but if the fluid be injected into a guinea pig, the animal will develop tubercle. In epi-

demio cerebro-spinal meningitis the cells in the deposit are polymorpho-nuclear leucocytes and in the leucocytes can be seen *Diplococcus intracellularis*. Septic, pneumonic and pyogenic organisms may also invade the central nervous system giving rise to meningitis, and in these cases the deposit will be polymorpho-nuclear leucocytes, and perhaps the specific organisms may be seen in stained preparations; but if not, they can be obtained by cultural methods.

Other formed elements which may be found are large cells, macrophages containing blood pigment; these cells indicate that haemorrhage has occurred. One of the most important uses of lumbar puncture has been the discovery of the cause of African sleeping sickness. The fluid withdrawn and centrifuged is found to contain large numbers of lymphocytes and plasma cells in addition to specimens of the actively moving organism *Trypanosoma gambiense*, a flagellate. In the forms of disease here described as containing cells in the centrifuged deposit, there is also in the fluid an appreciable amount of proteins. If pathological cerebro-spinal fluid be added to an equal quantity of saturated solution of sodium sulphate there will be a distinct turbidity indicating the presence of proteins in appreciable quantity. This appreciable quantity of proteins is especially significant in the case of fluid withdrawn from cases of general paralysis or tabes, for it goes *pari passu* in amount with the Wassermann sero-diagnostic reaction for syphilis.

African sleeping sickness is characterized by a progressive lethargy, paresis, tremors and the signs and symptoms of neural exhaustion without neural destruction; it comes on slowly and insidiously often years after infection and eventually terminates fatally by intercurrent disease or paralysis of the bulbar centres. Examination of the central nervous system explains the fatal lethargy; the perivascular and meningeal lymphatics are filled with lymphocytes and plasma cells and the neuroglia supporting cells have undergone a rapid proliferation. The effect of this morbid process is to deprive the neural elements of oxygen and nutrition; the neurones in consequence, although not destroyed, are nevertheless unable to function for more than a brief period.

Poisons Introduced into the Body.—The most widespread and potent cause of nervous and mental disease is the abuse of alcohol-containing liquids. At least 20 per cent of the inmates of the asylums of London are admitted with a history of alcoholism. Whether alcoholism is a cause or a result is still debatable. In not more than 10% is alcohol the efficient cause of the mental disease; in many it is only a contributory factor, and in not a few the lapse from moderation to intemperance is one sign of a mental disturbance. To people with unstable nervous systems a relatively small quantity of alcohol may act as a poison. Thus epileptics, imbeciles, criminals, potential lunatics, and the subjects of head injury are liable to become anti-social and dangerous to themselves and others by indulgence in quantities of alcohol which would have no harmful effect upon the mentally stable and sound individual. However, chronic alcoholics form a large proportion of those convicted for crimes of violence, homicide, suicide, and sexual offences. Another common effect of alcohol is *peripheral polyneuritis* (see NEURITIS), although frequently changes occur as well in the ganglion cells, from which the axis cylinders of the nerves have their origin. (See NERVOUS SYSTEM.) Alcoholic polyneuritic psychosis affecting women in many ways resembles delirium tremens (see DELIRIUM); the fact that neuritis occurs much more frequently in women is probably associated with the fact that when the female breaks through the resistance to her conflicts by the use of alcohol her regression is deeper and her indulgence greater. Many other poisons, notably lead and arsenic, the specific fevers before mentioned, syphilis and alterations of the blood due to imperfect metabolism, such as occur in diabetes and gout, may produce, or become important factors in producing, peripheral neuritis. The outbreak of arsenical neuritis from beer containing this poison in Manchester in 1900 (see ADULTERATION), is of interest from that fact that the symptoms closely resembled acute alcoholic neuritis. A distinctive feature, however, was the pigmentation of the skin and the severity of the nervous symptoms. A disease, common in the East, termed beri-beri (q.v.),

is a form of neuritis. Anaesthetic leprosy is an interstitial inflammation of the nerves due to the *Lepra bacillus*. Among the nervous diseases due to occupation may be cited lead-poisoning (*q.v.*). Lead also produces a chronic inflammation of the cerebral cortex, *Encephalitis saturnina*, causing a complex of symptoms, namely dementia, loss of memory, weakened intellect, paresis and epileptiform seizures, hallucinations of sight and hearing, and mental exaltation or depression. Mirror-makers suffer with characteristic fine tremors, from the slow absorption of mercury into the system. Workmen at indiarubber factories may suffer from severe mental symptoms, owing to the inhalation of the fumes of carbon bisulphide. Serious nervous symptoms have followed carbon monoxide poisoning. Cases which have recovered from the immediate effects have suffered with dementia and symptoms of disseminated sclerosis, the result of multiple haemorrhagic softening.

Certain other poisons, besides alcohol, act upon the nervous system when continually entering the body as the result of a *habit*, namely, absinthe, ether, cocaine, opium, morphin, hashish and tobacco. Each of these has a selective influence upon certain parts of the nervous system. In illustration thereof may be mentioned impairment of central vision in tobacco amblyopia. Other diseases of like kind are under pellagra (*q.v.*), ergot (*q.v.*), botulism (*see* MEDICAL RESEARCH).

Adequate and Pathological Stimulation.—The nervous system in the form of systems, groups and communities of neurones, each with special functions, yet all woven together in one harmonious whole, develops in a particular way in consequence of the awakening influence of stimuli from without and from accumulated instinct stimuli from within. Consequently nervous structures which are not used at all, or badly used are liable to undergo regressive metamorphosis and atrophy; thus amputation of a limb in early life causes atrophy of the nervous structures which dealt with the sensations and movements of the part. This may be seen in the grey (synapses) and white matter (conducting pathways) of the spinal cord; there may also be found an atrophy of the psycho-motor neurones of the brain functionally related to the sensory and motor terminal areas of the involved limb. The converse is also true; the longer a perverted function exists, the more unlikely it is to disappear and ultimately to bring about irreversible structural changes.

Mental pain in the form of grief, worry, anxiety, fright, shock, violent emotions (pleasurable or painful), disappointed love, and excessive intellectual work, frequently precede and determine various types (*a*) of psychoses, *e.g.*, maniac-depressive, paranoid; (*b*) of neuroses, *e.g.*, compulsion neurosis, hysteria, epilepsy, hystero-epilepsy; (*c*) or gross brain disease, *e.g.*, apoplexy, thrombosis, arteriosclerotic degenerations.

Visceral reflex irritation affords many examples of organ neuroses, the symptoms of which may be set up by irritation of the viscera, *e.g.*, intestinal worms. Teething and indigestible food are often the exciting cause in infants and young children of convulsions and spasms of the glottis (spasmophilic). Some anomalies of the female reproductive organs act as exciting causes in the release of hysterical reactions. Paroxysmal exacerbations of emotional disturbances are liable to occur at the menstrual period or menopause. Here the stimulus proceeds from the reproductive instinct. The irritation of a carious tooth may produce spasmodic tic or trigeminal neuralgia. Wax in the ear may occasion vertigo and tinnitus; and grave errors of refraction in the eyes may be an accessory factor in the causation of attacks of migraine. Irritation of the receptors of the vagus in almost any part of its widespread visceral origin may lead to vomiting. The characteristic pain of angina pectoris, which radiates down the inner side of the left arm, is partly explained by the fact that the cardiac branches of the sympathetic follow the vascular supply of the arm, and the stimulus from the diseased aorta or coronary vessels radiates as pain in the vascular area. The entire explanation is extremely complex¹. This is one example of a great number of *referred pains* studied so extensively by the English observers, Head and Mackenzie.

¹Spiegel, Wien, Kl. Woch. 40, 1927, 853.

Injury or Disease of Enclosing or Supporting Structures may lead to paralytic or irritative lesions of the nervous system, or the two may be combined. Blows or wounds of the head and spine may damage or destroy the nervous structures by shock or direct injury. Concussion of the brain or spinal cord may occur, as a result of injury, without any recognizable damage of the enclosing structures or even the central nervous system. Shock, due to concussion, can thus be explained as resulting from molecular or bio-chemical changes in the nervous structures.

Direct injury may cause local destruction of the nervous tissue; but wounds and diseases of the enclosing and supporting structures, if non-infective, give rise only to such symptoms as accord with the nerve structure irritated or destroyed. Should, however, the wound or diseased structure become infected, the disease spreads and becomes generalized; likewise the symptoms. Of the many causes of infective inflammation of the brain itself, middle-ear disease is the most important. It is very liable, when neglected, to be followed by a septic meningitis, encephalitis and brain abscess, the most frequent seat of which is in the adjacent temporal lobe, but it may involve other parts of the brain as well, for example the cerebellum and frontal lobe. The peripheral nerves may be destroyed or irritated by direct injury, disease or new growth in adjacent tissues, or they may be involved in the callus thrown out round the seat of a fracture.

Diseases of the blood-vessels are among the most frequent causes of gross brain disease. Arteries or veins—more frequently the former—may become blocked or ruptured from various causes. The immediate effect is a disturbance or loss of consciousness, and the individual may be “struck down” (*see* APOPLEXY) and never regain consciousness (*see* COMA). Should consciousness return, more or less permanent loss or disturbance of function becomes obvious. Paralysis of some form, especially hemiplegia, is commonest.

The cerebral arteries, usually the left middle cerebral may be occluded by embolism (*q.v.*). The area of brain supplied by that artery undergoes softening in consequence, resulting in paralysis of the opposite half of the body (hemiplegia) associated with aphasia when the paralysis affects the right side in a right-handed person (*see* Plate, fig. 5). When the embolus is infective, as in ulcerative endocarditis, it not only blocks the vessel but leads to an infective inflammation and softening of its coats, with the formation of an aneurism. The aneurism may suddenly rupture into the substance of the brain and produce apoplexy. Most cases of apoplexy from cerebral haemorrhage in young people are due to this cause. Softening may also arise from coagulation of the blood (thrombosis) in the arteries or veins. Many causes generally combine to produce thrombosis, *viz.*, a weak acting heart and altered conditions of the blood. It is sometimes met with in the cachexia of phthisis and cancer, in typhus and pneumonia, after parturition and in marasmus at all periods of life, but especially in the very young and very old. But thickening, roughening, and a degenerated condition of the cerebral arteries known as atheroma, when associated with a weak acting heart is especially liable to give rise to thrombosis and softening, and is a very common cause of apoplexy, paralysis and mental deterioration in people who have passed middle life. General disease of the arteries of the body, with chronic Bright's disease and high arterial pressure, is frequently associated with the formation of minute aneurisms upon the cerebral arteries, which may rupture and cause apoplexy. This is especially liable to occur in a vessel supplying the basal ganglia, the effused blood tearing through the motor efferent fibres (pyramidal tracts) lying between the optic thalamus and the corpus striatum (*see* Plate, fig. 4). The result is hemiplegia of the opposite side of the body. Disease of the arteries of the central nervous system, occurring in a person under 40, is generally due to syphilis, the virus of which produces an inflammation of the inner coats (*see* ARTERIES, DISEASES OF). The thickening and narrowing of the lumen with loss of elasticity of the arteries of the brain generally may suddenly or gradually set up cerebral anaemia and give rise to semi-comatose and comatose or even apoplectic states. Occlusion by the inflammatory proliferation or by the sudden clotting of blood in the diseased vessel may occur, the immedi-

THE HUMAN BRAIN AND SPINAL CORD IN HEALTH AND DISEASE

1. Horizontal section across a brain showing a softening in the left hemisphere due to a blockage of a cerebral artery. This caused right sided hemiplegia and aphasia
2. Right cerebral hemisphere of an adult man; normal state of convolutions
3. Horizontal section across a brain in which a haemorrhage in the right hemisphere had damaged the motor path to the left arm and leg causing left hemiplegia
4. Right half of the brain of a microcephalic idiot. There is complete absence of any convolitional pattern in the cortex of the brain, which closely resembles that of the sheep. The cerebellum is normally developed
5. Microscopic section of a degenerated area of cerebral cortex overlying a tumour, showing enlarged neuroglia cells
6. Right half of the brain of a microcephalic idiot (walnut type). Here the convolutions have shrunk and a bag of fluid replaces the temporal pole. This is due to a vascular lesion before birth
7. Microscopic section of the cerebral cortex of a case of general paralysis showing inflammatory cells surrounding a small vessel
- 8-11. Sections across the spinal cord in different common forms of spinal paralysis (the undamaged nerve fibres are stained black): 8. "Locomotor ataxy" in which the ascending or sensory fibres in the posterior columns degenerate. 9. "Disseminated sclerosis," in which patches of degeneration (pale areas) are scattered haphazard, damaging both sensory and motor fibres. 10. "Subacute combined degeneration," usually associated with anaemia, in which both sensory and motor fibres are affected. 11. "Motor neuron disease," in which all the descending or motor fibres degenerate

ate effect of which may be an epileptic or apoplectic fit; the result is softening; and as any or all of the arteries of the brain may be affected successively, simultaneously, or at random, the symptoms may be manifold. They may be general or local, and are often associated with inflammation of the membranes. The disease, under treatment, may abate, and the paralytic or mental phenomena partially or completely disappear, indicating the restoration, or partial restoration, of the circulation in the diseased arteries; sometimes with the lapse of treatment, and sometimes without, new symptoms manifest themselves, showing that the disease has attacked a fresh set of arteries. *Disseminated sclerosis (insular)* is another progressive, morbid process, the pathology of which is not fully understood, but is probably due to some toxic cause. Islands of nervous tissue undergo a morbid change, commencing in the myelin sheath and ending in an increase of the supporting neuroglia tissue at the expense of the true nervous tissue (see Plate, fig. 11).

Tumours and new growths in the central and peripheral nervous systems may be primary or secondary; the former arise in the supporting, enclosing or nutrient tissue elements; the latter are metastatic deposits from tumours originating elsewhere. Tumours may be single or multiple, the special symptoms occasioned depending upon the seat of the tumour and whether it destroys or only irritates the adjacent nervous tissue. Tumours situated within the cranial cavity cause general symptoms, namely, optic neuritis, severe headache and vomiting; these symptoms, which are caused by increased intracranial pressure, are more severe in rapidly growing vascular tumours, even though small, than in large slow-growing tumours. Some tumours are highly vascular and a large thin-walled vessel may suddenly rupture and cause an apoplectic fit. If the growth is situated in a portion of the cortex having some special localizing function, e.g., the motor area, it is likely to give rise to epileptiform convulsions, starting in a limb or definite group of muscles; but the irritation usually spreads to the whole motor area of the same side, and even extends to the opposite hemisphere, by an overflow of the discharge through the corpus callosum. In such case there is loss of consciousness. If, however, the tumour destroys the cerebral cortex of a particular region, it may give rise to a paralytic lesion, e.g., paralysis of the arm.

Diseases of the blood-vessels, or of supporting and enclosing tissues, produce secondary degenerations of the nervous system. The symptoms, like the lesion, are obtrusive; frequently arising suddenly, they may in a short time terminate fatally, or tend towards partial or complete recovery. Various forms of motor and sensory loss and disturbance of function may arise, indicating destruction or disturbance of particular regions of the central nervous system; and degenerations in certain tracts and systems of fibres arise, corresponding in histological character with those observed when a nerve fibre is separated from its cell of origin by section (secondary degeneration of Waller and Türck). This form of degeneration must be distinguished sharply from primary degeneration, which is due to an inherent nutritional defect of the nerve cell and all its processes (the neurone), in which a regressive metamorphosis occurs; it starts in the myelin sheath and the fine terminal twigs of the axis cylinder and dendrons, and proceeds back to the main branches and trunk, eventually destroying the trophic and genetic centre itself, the nerve cell. These *primary* degeneration processes are insidious in origin, progressive in character, and nearly always fatal; they, therefore, are associated with a progressive evolution of symptoms.

To cite some examples: (1) *Locomotor ataxy* (tabes dorsalis), is a primary degeneration affecting the *afferent* sensory system of neurones. (2) *Progressive spinal muscular atrophy* is a disease of the *efferent* motor system of neurones of the brain and spinal cord. Infantile paralysis (*Anterior poliomyelitis*), is an acute inflammation causing destruction chiefly of the spinal motor neurones of the ventral horn. It differs from the progressive spinal muscular atrophies in its sudden onset and non-progressive character; it resembles them in producing paralysis of muscles without sensory disturbance. (3) *General paralysis of the insane* (general paresis) is a degeneration which begins in the association

system of neurones of the cerebral cortex, but frequently is associated with degeneration of the *afferent* or *efferent* systems.

The psychoneuroses and benign psychoses have not been satisfactorily explained by definite morphological changes in the actual brain substance. We know little or nothing accurately about the morbid histology of certain chronic psychoses, or defect states, except as regards the morphological changes met with in cases of amentia and dementia. The large and illy circumscribed groups, called idiocy and imbecility, are associated with arrest of development of the brain, the naked-eye evidence of which may be afforded by small size and simplicity of convolutions of the brain as a whole or in part (see Plate, figs. 1, 2 and 3); and the microscopical evidence by arrest, or imperfect development, of structures connected with the higher functions of the mind, namely, the association neurones in the more superficial layers of the cerebral cortex. Various degenerative processes, either primary or secondary, broadly termed dementias, are associated with progressive decay and atrophy of the superficial layers of the grey matter of the cortex, and naked-eye evidence thereof is afforded by partial or general wasting of the cerebral hemispheres, accompanied with thickening of the pia-arachnoid membrane, atrophy of the convolutions, and with deepening and widening of the intervening sulci. Since the modern studies on this subject of V. Economo, Jakob, the Vogt's Josephy, Fünfgeld, Spatz, Spielmeyer and others have given a definite architectonic and myelotectonic knowledge of the cortex as well as the striatum the older studies of a former generation are obsolete. A newer cortical and subcortical pathology is being written and is to be found in special articles in this edition. At the present time a generalized neuropathology cannot be written.

The cerebro-spinal fluid fills up the space in the cranial cavity caused by the atrophy of the brain; consequently there is a great excess of this fluid. This wasting so characteristic a finding in general paralysis is especially due to atrophy of the cells and fibres of the superficial grey matter of the cortex, sections of which, examined microscopically, after suitable staining, show great poverty, or complete loss, of three sets of delicate myelinated fibres, namely, tangential, super-radial and the inter-radial corresponding to the line of Baillarger. This degeneration of the superficial association fibres of the cerebral cortex affects especially the frontal and central convolutions, and is the earliest and most constant microscopical change in general paresis. It is accompanied usually by meningeal and vascular changes, atrophy of the nerve cells, the proliferation of the neuroglia (fig. 7); especially characteristic is the perivascular infiltration with lymphocytes and plasma cells (see Plate, fig. 6). It was, indeed, thought that this condition of the vessels was pathognomonic of general paresis; it certainly is not, for it is found throughout the central nervous system in cases of African sleeping sickness and the arterial types of neurosyphilis. It has sometimes been known to occur in the neighbourhood of cerebral tumours but it is not found in uraemia or lead encephalitis.

Microscopical Changes in Degeneration of the Neurone.—

About 1850, Waller demonstrated that a nerve fibre undergoes degeneration to its termination when separated from its cell of origin; hence the term "Wallerian degeneration." Embryological researches by Prof. His showed that the axis-cylinder process (the essential conducting portion of the nerve fibre) is an outgrowth of the nerve cell. The cell, therefore, is the trophic and genetic centre of the nerve fibre. Acute alterations and death of the nerve cells may occur from toxic conditions of the blood; from high fever (107°–110° F); arrest of the blood supply, as in thrombosis and embolism; or actual destruction by injury, haemorrhage or inflammation. These morbid processes produce, as a general rule, bio-chemical as well as morphological changes in the nerve cell and its processes. When a nerve cell dies, the nerve fibre undergoes secondary degeneration and death; that is to say, the whole neurone dies, and regeneration, at any rate in the higher vertebrates, does not take place. Restoration, or partial restoration, of function is due to other structures taking on the function, and the more specialized that function is, the less likely is restoration to take place. If, however, a peripheral

nerve is divided, its component fibres are merely severed from their cells of origin. All that portion of the nerve which is in connection with the nerve cells of origin practically undergoes no change. The peripheral portion undergoes degeneration, but from the central end of the nerve new axis cylinders again grow out and a new nerve is formed. With this regeneration comes restoration of function, which may be hastened by suturing the ends of the cut nerve. A similar regeneration, however, does not occur after section of fibres of the white matter of the central nervous system, and this may be due to the fact that the nerve fibres of the white matter of the cerebro-spinal axis possess no nucleated sheath of Schwann, which plays an important part in regeneration; in the present writer's opinion, the neurilemmal sheath of the old fibre forms a new protoplasmic basis, into which the axis-cylinder from above grows, the passage of stimulus determining its function. The writer, working in conjunction with Prof. Halliburton, has shown that the characteristic microscopical changes in the myelin sheath which occur in the process of degeneration are due to a splitting up of the complex phosphoretted substance "protagon" into glycerophosphoric acid, choline and oleic acid by a process of hydration. The Marchi reaction, so useful for demonstrating degeneration of the central and peripheral nervous systems, is dependent upon the fact that the myelin sheath, after hardening in a solution of bichromate of potash, does not turn black when acted upon by osmic acid, whereas the simpler non-phosphoretted fatty product of degeneration is stained black. When the Marchi reaction of degeneration is fully developed, it has been ascertained that the nerve yields no phosphorus. The degeneration resulting from section of a nerve is termed *secondary*, to distinguish it from another, *primary*, due to slow and progressive decay of the whole neurone, beginning usually at the terminal twigs and proceeding back towards the cell body with its contained nucleus. These primary degenerations involve systems of neurones, correlated by function rather than by anatomical situation. Examples have been given already. The cause of primary degenerations is probably a defect inherited or acquired in the "vita propria" of the neurones affected. They slowly atrophy and disappear, and their place is filled up by an overgrowth of the supporting neuroglia tissue (see Plate, fig. 7). This overgrowth of dense tissue is termed sclerosis and was erroneously considered to be the cause, instead of the effect, of the atrophy of the nervous tissue.

NEUROPTERA, the term used in zoological classification for that order of insects which includes the alder flies, snake flies, ant-lion flies, lace-wings and their allies. They comprise small to rather large soft-bodied insects with usually elongate feelers and two pairs of similar, net-veined, membranous wings: the wings are closed roof-like over the body when at rest and the hind pair are almost always without a plicated posterior lobe. The mouth-parts are for biting, the tarsi are five-jointed and there are no cerci or tail feelers. All Neuroptera undergo complete metamorphosis and the larvae are active and predatory with well developed antennae, sense organs and legs: they are mostly terrestrial but some are aquatic. The pupae have the appendages free and are generally enclosed in silken cocoons.

Rather more than 2,000 species of Neuroptera are known and

of those only a little more than 60 occur in the British Isles while about 200 species are found in the United States.

Neuroptera are all insects of weak flight, they are rarely abundant in individuals and feed mostly upon soft-bodied insects or liquid matter such as honey-dew. Most of the species have beautiful net-veined wings which often exhibit a complex reticulation owing to the presence of numerous accessory veins. There are numerous veinlets arising from the costal vein and vein Rs is generally pectinately branched. In their larval stages they are exclusively predaceous. The order is divided into two sub-orders, viz., the Megaloptera and the Planipennia as given below.

SUB-ORDER I. MEGALOPTERA

Veins with little or no tendency to fork at the margins of the wings: vein Rs with but few extra branches. Larvae with biting mouth-parts: pupae not enclosed in a true cocoon.

This group includes a small number of archaic insects separable into two well defined divisions comprising less than 200 species throughout the world. (1) The Sialidae include the alder flies (*q.v.*) so called because in England the adults often frequent alders along the banks of streams. Their larvae live in the water and respire by means of seven or eight pairs of slender, jointed, abdominal gills. The genus *Sialis* is widely distributed with two British and one North American species. The Dobson-flies *Corydalids*, found in America (North and South) and northern India, attain a great size with immense jaws in the males. The smaller allied forms (*Chauliodes*, etc.) are often known in America as fish-flies. (2) The Raphidiidae or snake flies (*q.v.*) are distinguished by the elongate prothorax and the very long ovipositor in the female. They are terrestrial insects whose larvae are found under the bark of trees. Nine species are found in North America and four species of the genus *Raphidia* occur in Britain.

SUB-ORDER II. PLANIPENNIA

Veins with evident forking at the margins of the wings: vein Rs usually with numerous branches. Larvae with piercing mouth-parts: pupae enclosed in a cocoon.

Included here are the major portion of the Neuroptera: they are nearly all terrestrial insects, only a small number being partially or truly aquatic in their larval stages. The Planipennia are divided into 16 families of which only the most important are mentioned.

The Ithonidae or moth-lacewings are confined to Australia: they are large, stoutly built, moth-like insects with primitive venation. Their larvae live in the soil where they prey upon those of chafer beetles, to which they bear a close general resemblance. The Hemerobiidae or brown lacewings are widely distributed and

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)
FIG. 1.—A GREEN LACEWING (CHRYSOPIDAE)

fairly numerous in species. Their larvae along with those of the Chrysopidae or green lacewings (fig. 1) roam about vegetation preying upon aphides, mites, thrips and other soft-bodied insects (see LACEWING-FLY). The Osmylidae and Sisyridae have aquatic larvae: the insects of the first mentioned family are medium to large-sized species which differ from the lacewings in certain venational characters. *Osmylus chrysops* is the largest British Neuropterous insect and occurs locally along the borders of streams where there is dense vegetation. The Sisyridae differ in having very few cross-veins to the wings besides being much smaller in size. They are brown or fuscous insects found along the borders of rivers which contain the fresh-water sponge upon

which their larvae feed and live. Three species of *Sisyra* occur in Britain and this genus, along with *Climacia*, is found in the United States. The Mantispidae or mantis flies (*q.v.*) are easily distinguished by the elongate thorax and the prehensile fore-legs which resemble in form those of the common mantis (*q.v.*) and are likewise used for seizing other insects which serve as their prey. The larvae of the European *Mantispa styriaca* are predacious upon

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)
FIG. 2.—HALTER IMPERATRIX (NEMOPTERIDAE)

young *Lycosa* spiders and during development they undergo striking changes of form constituting hypermetamorphosis. The family is mainly tropical but ranges into southern Europe and a few rare species occur in the United States. The Psychopsidae have very broad, rounded wings supported by a stout "mid-rib" and with a densely reticulated venation. Many are insects of striking beauty and their larvae have been found beneath bark of trees. The family has a wide discontinuous range occurring in South Africa, Tibet, China and Australia. The Nemopteridae (fig. 2) differ from all other Neuroptera in having very long thread-like or ribbon-like hind wings. Their larvae occur in caves on the floors of buildings among debris, etc., where they prey upon smaller forms of insect life. The family occurs in many of the warmer parts of the world including southern Europe but is absent from North America. The Myrmelionidae or ant-lion flies (*q.v.*) bear a general resemblance to dragon-flies and have short knobbed feelers. Although most abundant in the warmer parts of the world, several species occur in Europe, one being found as far north as Sweden, but none are found in the British Isles: about 60 species inhabit the United States. Their larvae live on the ground where some make pit-like snares for entrapping their prey, while others hide away under stones or debris. The Ascalaphidae are closely related to the preceding family but can easily be separated by their much longer antennae as well as by venational differences. Their larvae either hide away on the ground or live concealed on the bark of trees. They are chiefly tropical insects only a few species occurring in southern Europe and North America. The Coniopterygidae, or mealywings, number about 50 species and are the smallest and most aberrant of all Neuroptera. They are covered with a white powdery secretion, their wings have comparatively few veins and the hind wings are much reduced in size. Their larvae roam about plants, preying upon aphides, scale-insects and mites. Rather more than half a dozen species are found in Britain and a similar number occur in the United States.

Natural History (fig. 3).—The eggs of Neuroptera are ovoid and in several families, including the green lacewings, the female exudes a sticky secretion which she draws out into a hair-like stalk upon which the egg is laid for safety. The larvae, with few

exceptions, are terrestrial or arboreal and in the Planipennia they are all characterized by the greatly drawn out mandibles and maxillae which are used for seizing and perforating the prey. The mandibles are grooved along their ventral surface and the maxillae, which closely resemble them in form, fit one into each groove: in this way the two sets of appendages function as a pair of tubes through which the body-juices of their victims are sucked out. Larvae of the Planipennia are further remarkable for the fact that six out of their eight Malpighian tubes become transformed into silk glands, the silk being emitted through an anal spinneret. The larvae of all Neuroptera are carnivorous and mostly prey upon other forms of insect life. When fully fed those of the Planipennia construct silken cocoons and, prior to the emergence of the perfect insect, the pupa cuts open the cocoon with its mandibles and, being mobile, often travels some little distance before the imago emerges. Little is definitely known respecting the specific nature of the food of the perfect insects: many are nocturnal in habits and are attracted to lights, while most of the day-flying species are rarely seen on the wing.

Geographical Distribution.—Certain families of Neuroptera are nearly world-wide in their distribution, the Chrysopidae for example, being found in almost all extensive areas of land excepting New Zealand: the Sialidae have an almost world-wide though discontinuous range, while the Raphidiidae are apparently restricted to the northern hemisphere. Several families, on the other hand, are almost confined to Australia which has a more complete and diverse fauna of Planipennia than any other region of the globe, although the Megaloptera are only represented there by four species. Only seven families of Neuroptera occur in the British Isles and 13 families are found in the United States.

Geological Distribution.—The Megaloptera are evidently an archaic group but their fossil remains, unless very perfect, are difficult to identify. The earliest undoubted remains of this sub-order have been found in the Triassic rocks of Europe. The Planipennia

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)
LIFE CYCLE OF BROWN LACEWING (HEMEROBIS STIGMA)

first appear as fossils in the Upper Permian beds of Belmont, New South Wales, where they are represented by the genus *Permithone* which appears to be an ancestor of the existing Ithonidae and possibly of other families also. The sub-order is well represented in the Liassic and Upper Jurassic rocks of Europe.

Economic Importance.—Neuroptera as a whole are distinctly beneficial to man in their larval stages. Larvae of the Sialidae form food for trout and other fishes, while those of the Planipennia prey upon many soft-bodied noxious insects. In Europe and North America the most beneficial families are the Hemerobiidae,

Chrysopidae and Coniopterygidae and in Australia larvae of the Ithonidae destroy numbers of Scarabaeid grubs in the soil.

BIBLIOGRAPHY.—For the British species consult R. MacLachlan, *Trans. Entomological Soc., London* (1868); also J. J. F. X. King and J. N. Halbert in *Proc. Roy. Irish. Acad., B.* (1910). Admirable accounts of the structure and habits of Neuroptera are given by C. L. Withycombe in *Trans. Entomological Soc., London* (1922 and 1925). The Australian forms are of special interest and for these consult R. J. Tillyard, *Proc. Linn. Soc. New South Wales* (vol. xli-xliv, 1916-19). The North American species are listed by N. Banks in *Trans. Amer. Entomological Soc.* (1907) who has also revised the Hemerobiidae and their allies (*Ibid.*, 1906). For accounts of the life-histories of the Chrysopidae see R. C. Smith, *Mem. 58, Cornell Univ. Agric. Exp. Station* and the same writer has dealt with the habits of the Hemerobiidae in *Annals Entomological Soc. America* (vol. xvi, 1923); for the North American alder flies, etc., see K. C. Davis, *Bull. 68 N.Y. State Museum*. (A. D. I.)

NEUSALZ, a town in the Prussian province of Silesia, on the Oder, 20 m. by rail N.W. of Glogau. Pop. (1925) 14,212. Neusalz became a town in 1743. Its largest industry is, perhaps, the manufacture of thread; there are also in the town ironworks, breweries, shipbuilding yards and electrical works. Lignite is mined in the neighbourhood and chemicals manufactured. It is developing trade, especially towards the Polish frontier, because of its numerous rail and river connections.

NEUSS, a town in the Prussian Rhine province, lies 4 m. to the W. of Düsseldorf and 1½ m. from the west bank of the Rhine, with which it is connected by the Erft canal. It lies at the junction of lines to Cologne, Viersen, Zevenaar (Holland), Düsseldorf, Düren and Rheydt. Pop. (1925) 44,978, of whom the majority were Catholics. Neuss, the *Novesium* of the Romans, mentioned by Tacitus, formerly lay close to the Rhine. Drusus, brother of the emperor Tiberius, threw a bridge across the Rhine here, and his name is preserved in the Drususstör, the lower half of which is of Roman masonry. In 1474-75 Charles the Bold besieged the town in vain for 11 months, but it was taken and sacked by Alexander Farnese in 1586. Extensive excavations have been made and many Roman treasures have been unearthed.

The church of St. Quirinus is a fine example of the transition from the Round to the Pointed style. The town hall was built in the 17th and altered in the 18th century.

NEUSTADT (Polish, *Prudnik*), a town in the Prussian province of Silesia, on the river Prudnik, 60 m. by rail S.E. of Breslau. Pop. (1925) 17,050.

NEUSTADT-AN-DER-HAARDT, a town of Germany, in the Bavarian Palatinate, situated under the eastern slope of the Haardt mountains and at the mouth of the valley of the Speyerbach, 14 m. W. of Speyer, and at the junction of railway lines to Worms, Weissenburg and Kaiserslautern. Pop. (1925) 20,726. Neustadt, which became a town in 1275, is one of the centres of the Rhenish "grape-cure." The Protestant abbey church, a Gothic edifice, dates from the 14th century.

NEU-STETTIN, a town in the Prussian province of Pomerania, on the small Stretzig lake, 90 m. by rail E.N.E. of Stettin, at the junction of railways to Belgard, Posen and Stolpmünde. Pop. (1925) 15,518. Neu-Stettin was founded in 1313 by Wratislaus, duke of Pomerania.

NEU-STRELITZ, a town of Germany, capital of the republic of Mecklenburg-Strelitz, situated between the Zierker See and the Glambecker See, 60 m. N. of Berlin, on the railway to Stralsund, at the junction of lines to Warnemünde and Wittstock. Pop. (1925) 12,100. Neu-Strelitz was not founded till 1726. The former ducal residence is a pseudo-classical edifice, with a library.

About 1½ m. to the south lies Alt-Strelitz (pop. 4,820), the former capital of the duchy.

NEUSTRIA, the old name of the western kingdom of the Franks, as opposed to the eastern kingdom, Austrasia (*q.v.*). The most ancient form of the word is *Niuster*, from *niust*, which would make the word signify the "most recent" conquests of the Franks. The word Neustria does not appear in Gregory of Tours, but is found for the first time in Fredegarus. Under the later Merovingian kings the princes reigning in the West were called kings of Neustria, and those reigning in the East, kings of Austrasia. Under the new Carolingian dynasty, the word Neustria was restricted to the district between the Loire and the Seine, together with part

of the diocese of Rouen north of the Seine; while Austrasia comprised only the Frankish dominions beyond the Rhine, together, apparently, with Mainz, Worms and Spire on the left bank. The districts between Neustria and Austrasia were called *Media Francia* or simply *Francia*. In 843 Brittany took from Neustria the countships of Rennes and Nantes; and gradually the term Neustria came to be restricted to the district which was later called Normandy. By a similar usage, the term Neustria was applied in Italy in the 8th century to western Lombardy.

See F. Bourquelet, "Sens des mots France et Neustrie sous le régime mérovingien," in the *Bibliothèque de l'école des chartes*, xxvi. 566-574; Longnon, *Atlas historique de la France*.

NEUTRALITY has been defined as the legal status arising from the abstention of a state from all participation in a war between other states, the maintenance by it of an attitude of impartiality in its dealings with the belligerent states, and the recognition by the latter of this abstention and impartiality. From this legal status arise the rights and duties of neutral and belligerent states respectively. Under the conception of absolute sovereignty prevalent before the World War one state might go to war with another for a good or bad reason, or for no reason at all, and a violation of international law by one state was regarded as no concern of any other, except that immediately affected by such violation. With the creation of the League of Nations, however, a new conception arose. The League is based upon international solidarity, hence neutrality and a League of Nations are mutually exclusive. In the next war, said President Wilson, there will be no neutrals. But the League is not yet universal. The United States and Russia, to mention only the most important, are not members; and even among members the Covenant of the League fails to prohibit neutrality in all circumstances. Consequently the legal status of neutrality still retains an important place in international law.

Rights and Duties of Neutrals.—These may be subdivided into the rights and the duties of neutrals; and the rights and liabilities of trade. A neutral state is entitled to have the integrity of its territory and territorial waters respected by all the belligerents. By the Hague Convention of 1907 its territory is inviolable; it is entitled to notice of a state of war, unless it can be proved that it was aware of its existence, so that the date from which its liabilities commence may be ascertained (Hague Convention III., 1907). In the case of a civil war, its liabilities will commence only when a state of belligerency is established; for instance, Great Britain contended that the proclamation of a blockade of the coasts and ports of the seceding states by President Lincoln on April 19, 1861, was a recognition of such states as belligerents. That is to say, it is entitled to prevent and nullify, by force if necessary, war-like operations by any of the belligerents committed in violation of such integrity. It is also entitled to exact compliance by belligerents with its own municipal regulations, designed to maintain its neutrality and to perform its international obligations. If such regulations are enforced equally upon all the belligerents, they are not to be regarded as hostile or unfriendly. It is entitled to maintain its diplomatic intercourse with other neutral states and with the belligerents alike, except for such temporary interruptions as may be demanded by military necessity. It is entitled to offer its good offices or mediation to the belligerents with a view to the cessation of hostilities without the exercise of this right being regarded as an unfriendly act (Hague Convention I., 1907). Finally it is entitled to require belligerents not to interfere with the commercial intercourse of its subjects, unless such interference is warranted by International Law.

Armed Neutrality.—In his address to Congress on Feb. 26, 1917 President Wilson, after recounting the failure of diplomatic methods to protect the neutral rights of the United States from their violation by Germany, declared that "there may be no recourse but to armed neutrality, which we shall know how to maintain and for which there is abundant American precedent." There were also European precedents for armed neutrality.

In 1780 Russia issued a declaration of neutral rights, to which Sweden and Denmark adhered, which became known as the First Armed Neutrality. Spain, France, Holland and the United States—

all in a state of war with Great Britain—Prussia, Austria, Portugal and the two Sicilies, subsequently joined the league. The object of this declaration was to limit the list of contraband commodities. In 1800 Russia with Denmark, Prussia and Sweden formed the Second Armed Neutrality, the object of which was to exempt from visit and search neutral merchantmen under convoy.

Duties of Neutral States.—The primary duty of a neutral state is strict impartiality in its relations with both belligerents, whether such impartial conduct is obligatory or discretionary. There must not be any discrimination or preference. Even a favour granted to one must be extended to the other. A neutral state must not allow a belligerent to move troops, munitions of war or supplies across its territory or to erect or use therein wireless or other telegraphic apparatus for military purposes. It must intern belligerent forces which have taken refuge in its territory, but may leave at liberty escaped prisoners of war and permit the passage of the sick and wounded belonging to the belligerent forces (*Hague Convention V.*, 1907). It must not allow any act of war, including the exercise of visit and search or capture, to be committed by a belligerent within its territorial waters. It must release a prize so captured with its officers and crew and intern the prize crew. It must not allow a prize court to be established on its territory nor on a vessel within its territorial waters. It must not allow either belligerent to use territory or territorial waters as a base of military operations against its adversary, nor may it furnish either belligerent with troops, ships, munitions of war, money or with commodities of direct or indirect use in the war. It must use due diligence in preventing the fitting out or arming of vessels within its jurisdiction and the departure of vessels intended to engage in hostile operations; the issue of commissions by either belligerent or the enlistment of men (*Hague Convention*, XIII., 1907, the Neutrality Act, 1818 U.S.A. and the Foreign Enlistment Act, 1870, 33-34 Vict. C. 90).

Rights and Liabilities of Neutral Trade.—Restraint on neutral trade with belligerents rests upon a compromise between two conflicting principles. On the one hand the subjects of a neutral state contend that they are entitled to carry on their normal trade with either belligerent, provided such trade is not directly calculated to prejudice the military operations of one belligerent, nor to promote those of the other. On the other hand a belligerent state claims that the subjects of a neutral state are not entitled to supply his enemy with commodities which are of direct and indirect use to his enemy in the conduct of the war. Between these two contentions there have been great divergencies both in theory and practice. A state is apt to take a different view when belligerent from that which it maintained as a neutral. But upon one matter there is no difference of opinion. It is generally recognized that it is for the belligerent and not for the neutral state to enforce the restraints on neutral trade; that it is the duty of the neutral state to acquiesce in such restraints in so far as they are not unwarrantable; and that the violation of such restraints by the subjects of a neutral state are not criminal and only involve the perpetrators in the seizure and loss of their property. The most important restraints on neutral trade are those imposed by the rules relating to blockade (*q.v.*); pacific blockade (*q.v.*); contraband (*q.v.*); continuous voyage; convoy (*q.v.*); unneutral service; and visit and search (*q.v.*).

Continuous Voyage.—The doctrine of continuous voyage has been referred to under CONTRABAND (*q.v.*). It was first applied by Lord Stowell to the engagement of neutrals in a trade closed to them in time of peace (*The Immanuel*, 2 C. Rob. 186 [1799]). In this case a neutral vessel sailing from Hamburg was condemned for carrying food, during the war between Great Britain and France, from Bordeaux to St. Domingo, a French colony. The doctrine was also applied by Lord Stowell in *The Yonge Pietor*, 4 C. Rob. 79 (1801), under the rule prohibiting trade with the enemy. In this case the goods were consigned to a neutral port with an ultimate destination by land to an enemy port. This gave rise to the doctrine of "continuous transport." Secondly the doctrine was applied during the American Civil War both to blockade and contraband.

At the Naval Conference (1908-9) it was found impossible to reach agreement upon the question of the engagement of neutrals in a trade closed to them in time of peace, but the Declaration of London did deal with the application of the doctrine of continuous voyage to blockade and contraband. By Art. 19 whatever might be the ulterior destination of a vessel or her cargo, she was not liable to capture if at the moment she was on her way to a non-blockaded port, although it was still open to the captor to prove that the alleged destination to a neutral port or open port was merely simulated. But such capture was permissible only within the area of operations or on a pursuit commenced therefrom. Art. 39 provided that absolute contraband should be liable to capture if shown to be destined to territory belonging to or occupied by the enemy or to his armed forces.

During the World War the doctrine of continuous voyage and continuous transport was applied by the Allied and Associated Powers to conditional as well as to absolute contraband, and was fully examined by Sir Samuel Evans in the *Kim* (1918) 1 B. and C.P.C. 405. For the French practice, see the *Karimata*, Fanchille, *Jurisprudence Française en Matière de Prises Maritimes*, 62, 92; for the Italian see *S. S. Kyzicos*, Fanchille, *Jurisprudence Italienne en Matière de Prises Maritimes*, 57.

Destruction of Neutral Prizes.—By the law of nations merchantmen must always be brought in for adjudication and consequently must never be destroyed by their captors (the *Actæon* [1818] 2 Dods: 48, the *Felicity* [1819] 2 Dods: 381, and *Maisonmaire v. Keating* [1815] 2 Gall: 325). The old rule, however, that neutral vessels must never be destroyed, was rejected by Russia in her naval instructions in 1868, 1895 and 1901; by France in 1870; by the United States in 1812 and 1898; by Japan in 1904 and by Germany in 1908. Art. 48 of the Declaration of London provided that "a neutral vessel which has been captured may not be destroyed by the captor but she must be taken into such port as is proper for the determination thereof of all questions concerning the validity of the prize." But this provision is qualified by Art. 49 which declares: "As an exception a neutral vessel which has been captured and which would be liable to condemnation, may be destroyed if the observance of Art. 48 would involve danger to the safety of the warship or to the success of the operations in which she is engaged at the time." By Art. 50, before destruction, all persons must be placed in safety and the ship's papers taken on board the warship, and by Art. 51 the captor must prove that the destruction was demanded "in the face of exceptional necessity."

Upon failure to prove this, the captor was bound to make full compensation, whether the capture was valid or not. It was contended at the time by some Powers that these guarantees virtually amounted to the renunciation to the right of destruction, but the present writer declared that Art. 49 would lead to piracy. And so it proved in the World War. Under the plea of "danger to the safety of the warship" and of "exceptional necessity," the German Government ordered the officers of submarines to sink enemy and neutral merchantmen alike at sight and without leaving a trace (*spürlos versenken*). It is estimated that 1,720 neutral vessels were thus destroyed by Germany and her allies, and over 2,000 neutral sailors killed or drowned.

By the Treaty of Washington, 1922, between the United States, Great Britain, France, Italy and Japan, a merchantman must not be destroyed unless the crew and passengers have been first placed in safety, and if the submarine cannot capture a merchantman in conformity with the rules applicable to other war vessels, it must permit the merchantman to proceed unmolested. Violation of these rules will be deemed an act of piracy and the plea of superior orders will be no defence. These provisions have not been ratified by France.

Unneutral Service.—A neutral individual is of course guilty of unneutral service who breaks blockade or carries contraband. But there are certain acts of a particularly distinctive service to which the term unneutral service is usually applied. These are divided into two classes by the Declaration of London according to the gravity of the act. In the first is included service which is only partial. By Art. 45 when a neutral vessel is engaged to

carry military persons or despatches, concurrently with employment of an innocent character, she is liable to be treated in the same manner as a neutral vessel engaged in the carriage of contraband. The vessel may be condemned and the cargo if it belongs to the owner of the vessel. These are sometimes described as analogues of contraband, and so she will be treated throughout as a neutral vessel. But a neutral vessel which identifies herself with the enemy falls into the second class: she is definitely guilty of "hostile service."

By Art. 46, a neutral vessel is liable to be treated as an enemy merchantman (1) if she takes a direct part in the hostilities; (2) if she is under the orders or control of an agent placed on board by the enemy Government; (3) if she is in the exclusive employment of the enemy Government; (4) if she is exclusively engaged at the time either in the transport of enemy troops or in the transmission of intelligence in the interests of the enemy. In these cases goods belonging to the owner of the vessel are liable to condemnation with the vessel. By Art. 47, an individual liable to military service found on board a neutral vessel may be made a prisoner of war; and by Art. 12 of The Hague Convention X., 1907, enemy sick or wounded found on board neutral hospital or merchant ships may be removed.

During the World War the German Government having removed all persons liable to military service from the occupied territories of Belgium and France, Great Britain in Dec. 1914 declared they would no longer be bound by Art. 47 of the Declaration, and that they would arrest all reservists found on board neutral vessels. This action was avowedly by way of reprisal. Nevertheless neutral states protested that such persons were not actually incorporated in the armed forces of the enemy and so not within Art. 47. This is probably true, but apart from the Declaration, persons of military age returning to their country of origin for the purpose of military service are really "noxious persons," who, if found on board neutral ships bound to an enemy port or even to a contiguous neutral port, may be seized.

Inviolability of Postal Correspondence.—By The Hague Convention XI. of 1907 the postal correspondence of both neutrals and belligerents, whatever its official or private character may be, found on board a neutral or enemy ship is inviolable. If the ship is detained the correspondence must be forwarded by the captor at once. These provisions do not apply to correspondence destined for, or proceeding from a blockaded port. This right to inviolability does not exempt a neutral mail ship from the laws and customs of maritime war. The ship, however, may not be searched except when absolutely necessary, and then only with as much consideration and expedition as possible. Apart from the Convention neutral mail ships and other vessels carrying mails, even though the property of a neutral Government, are not by international law exempt from the ordinary process of the tribunals of a belligerent, unless expressly exempted by treaty. Thus, such vessels are still subject to visit and search.

During the World War, Hague Convention XI. did not apply since it had not been ratified by some of the belligerents. Nevertheless in the first year of the war the Allied Powers did not interfere with the mails found on neutral vessels. But when it was discovered that the Germans were sending contraband through the post and more particularly by means of the parcels post, they insisted upon the right of search and seizure. In their protest against this policy the United States admitted that there was a distinction between such articles as bonds and other securities which might be regarded as merchandise, and shipping documents and money-order lists which should be regarded as genuine correspondence. By such a distinction a right of censorship was obviously implied, but such a censorship on the high seas, owing to German submarine methods, was impracticable.

Neutral vessels were therefore either induced by the Allied Powers to enter allied ports voluntarily for the purpose of search and censorship, or were brought in involuntarily. In their protest against this practice the United States did not complain so much that the exercise of jurisdiction over such vessels was abused, as that the Allied Powers, by sheer naval force, compelled neutral steamship lines to cause their mail steamers to

put into allied ports, and thus subject them to the control of the territorial sovereign. The Allied Powers justified this practice on the ground of necessity.

Reprisals.—Even neutrals may suffer by measures of reprisal taken by one belligerent without having any legal ground of complaint. The British Order in Council, Feb. 16, 1917, was issued as a measure of retaliation for the German declaration of Feb. 1, 1917, of unrestricted submarine warfare in certain designated zones. The Order provided that a vessel encountered at sea on her way to or from a port in a neutral territory affording means of access to the enemy territory without calling at a port in British or Allied territory should be deemed to be carrying goods with an enemy destination, or of enemy origin and should be liable to capture and condemnation. *The Leonora*, 3 B. & C.P.C. 181, 385 [1919] A.C. 974, was a Dutch vessel, with coal laden at Rotterdam for Stockholm. The coal was produced in Belgian collieries under the control of the German Government and sold by it to a Swedish company. In condemning the ship and cargo, Evans P. held that the Order did not entail unreasonable inconvenience upon neutrals, having regard to all the circumstances. Upon appeal Lord Sumner gave the following opinion: "There are certain rights, which a belligerent enjoys by the law of nations in virtue of belligerency, which may be enforced even against neutral subjects and to the prejudice of their perfect freedom of action, and this because without those rights maritime war would be frustrated and the appeal to the arbitrament of war would be made of none effect."

This and the previous case of *The Stigstad*, 2 B. & C.P.C. 179; 3 ib., 347 [1919] A.C. 279, decided that retaliation is a belligerent right and that retaliatory measures may be enforced against neutrals. If, said Sir Erle Richards, retaliation be a legal right, neutrals can have no cause of complaint.

NEU-ULM, a town in Bavaria. Pop. 11,919 (1925). The town is situated on the Danube, opposite Ulm, and is a railway centre. It was incorporated as a town in 1857.

NEUVE CHAPELLE, BATTLE OF (March 10–13, 1915). Neuve Chapelle is a village in Pas de Calais west of Lille. Pop. 319 (1921). To understand the tactical idea upon which the battle of Neuve Chapelle was founded (the first of the siege warfare battles undertaken by the British army in France) it must be clearly kept in view that the British higher command had not grasped the fact that the war which now confronted them was an engineer-artillery war, and not a cavalry-infantry one. They considered that infantry could "open a door for an inroad of horsemen against the enemy's rear," and in spite of the failure of Neuve Chapelle, this quite impossible idea governed the tactics of Sir John French and Sir Douglas Haig up to the end of the war.

Plan of Attack.—On Feb. 12, General Haig recommended an offensive towards the Aubers ridge on a frontage of 2,000 yards between Port Arthur and the Moated Grange. Neuve Chapelle was to be the first objective, then a line east of the village, and finally the Aubers ridge, the occupation of which would threaten the enemy's communications between La Bassée and Lille. Sir John French, the commander-in-chief, approved of this plan, and fixed its date as soon after March 9 as weather would permit. The attack, or rather assault, was to be carried out by two corps, the Indian corps on the right and the IV. corps on the left. It was to be made after an intense artillery bombardment of 35 minutes' duration. Having broken the enemy's front, it was proposed to extend the attack to five miles in width, and so make room for the cavalry corps to pass through and pursue. The bombardment was to be carried out by 530 guns and howitzers, and the ammunition available was approximately 216,380 rounds.

Operations of March 10.—At 4.30 A.M. the assaulting battalions were in position. The morning was cold and misty, and visibility was bad. Sunrise was at 6.30 A.M., and exactly one hour

later the general bombardment was opened. At 8.5 A.M. the attack was launched, and its first phase was carried out with considerable success. At 8.50 A.M. Neuve Chapelle was entered, but here the advance of the right was brought to a standstill by the British artillery barrage which had lifted, and was now falling between the village and the Bois de Biez. The first real trouble was experienced on the two flanks, on the right from the Bois de Biez, and on the

PLAN OF THE BATTLE OF NEUVE CHAPPELLE, MARCH 10-13, 1915

left from Manquissart, from both of which a heavy fire was directed on the attackers rendering it impossible for them to extend their front rapidly. By 1 P.M. the whole of the first objective, except part of the Port Arthur salient, was in British hands. Then came a delay. Sir Douglas Haig proposed to advance on the Aubers ridge at 2 P.M., but this attack had to be postponed. This enabled the Germans to push forward reserves to their second line position east of the village, which was only partially dug. From this line an effective cross fire was brought to bear on the north of Neuve Chapelle.

Operations of March 11.—During the night the Germans strengthened their new front line. The main attack was carried out by the IV. corps, and was directed on Aubers, the Indian Corps supporting it on the right. It was launched at 7 A.M., but was at once crushed by heavy machine gun fire opened from the concave position now held by the enemy. A little after noon the attack had to be abandoned. It was then clear that until the infantry assault could be prepared by an effective bombardment, to continue the action would lead to unprofitable slaughter.

Operations of March 12.—At 5 A.M. on the 12th the Germans made a strong counter-attack which, however, failed in its object. This was followed by an order from Sir Douglas Haig to continue the attack. It was ordered and then postponed with the inevitable confusion resulting. The IV. Corps was instructed to "push through the barrage of fire regardless of loss." The Bois de Biez was to be taken "at all costs." The 7th and 8th Divisions were to push on "regardless of the enemy's fire," with the inevitable result that hundreds of men were at once shot down. By nightfall it became obvious that the battle could not be continued, and early on the 13th Sir John French, having lost 12,892 officers and men, wired to Lord Kitchener: "Cessation of the forward movement is necessitated . . . above all by want of ammunition."

Comments.—The true reason for the failure was lack of understanding. An attempt was made to attack a fortress as if it were a deployed army in the field. The conception of surprise was admirable, but it was useless to expect to capture the Aubers ridge from a frontage of 2,000 yards. To do so the frontage should have been at least 12,000 yards, because the ridge was some 6,000 yards

distant, and because in siege-warfare the normal depth of penetration is half the length of the initial base. Nevertheless, in this battle, the first of the British grand attacks, and the first in which the "barrage" was used, more common sense was shown in restricting the artillery bombardment to the shortest possible time than in any subsequent battle up to that of Cambrai in November 1917. The German defences were but half a mile deep, and it was possible to fracture them by artillery fire if the bombardment were rapid, for rapidly carried with it surprise.

NEUVILLE, ALPHONSE MARIE DE (1836-1885), French painter, was born at Saint-Omer, France, on May 31, 1836. From school he went to college, where he took his degree of *bachelier ès lettres*. He first took up painting in 1856, after passing through the Naval College at Lorient. For a time he worked in Picot's studio, but was painting independently when he produced his first picture, "The Fifth Battalion of Chasseurs at the Gervais Battery (Malakoff)." In 1861 he exhibited "The Light Horse Guards in the Trenches of the Mamelon Vert," at the Salon. His pictures of military life showed peculiar insight, but his full power was not reached till after the war of 1870, episodes in which he depicted in a famous series, including the "Bivouac before Le Bourget" (1872), "The Last Cartridges" (1873), the "Surprise at Daybreak" (1878), and a considerable number of drawings. He also exhibited in London some episodes of the Zulu War. In 1881 he was made an officer of the Legion of Honour for "The Cemetery of Saint-Privat" and "The Despatch-bearer." He also collaborated with Detaille in "The Panorama of Rézonville." De Neuville died on May 18, 1885.

See Montrosier, *Les Peintres militaires* (1881), and "De Neuville" in *Gazette des beaux arts* (1885).

NEUWIED, a town in the Prussian Rhine province, on the Rhine, 8 m. below Coblenz, on the railway from Frankfurt-on-Main to Cologne. Pop. (1925) 20,432. Neuwied was founded by Count Frederick of Wied in 1662, on the site of the village of Langendorf. Among those who sought refuge here was a colony of Moravian Brethren; they still occupy a separate quarter of the town, where they carry on manufactures of porcelain stoves. Near Neuwied one of the largest Roman *castra* on the Rhine has been excavated. The principal building is the château, which contains a collection of Roman antiquities.

NEVA, a river of Russia, which carries off into the Gulf of Finland the waters of Lakes Ladoga, Onega, Ilmen and many smaller basins. It issues from the south-west corner of Lake Ladoga in two channels, which are obstructed by sandstone reefs, so that the better of the two has a depth of only 7 to 16 feet. A little farther down it becomes completely navigable, and attains a breadth of 4,200 ft.; but between the village of Ostrovki and that of Ust-Tosna it passes over a limestone bed, which produces a series of rapids, and reduces the width of the river from 1,050 to 840 and that of the navigable passage from 350 to 175 feet. Nine or ten miles before reaching its outfall the river enters Leningrad, and 5 or 6 m. lower down breaks up into the Great Neva (850 to 1,700 ft. wide), the Little Neva (945 to 1,365), and the Great Nevka (280 to 1,205), this last, 2 m. farther on, sending off the Little Nevka (370 to 1,130 ft.). Its total length is only 40 miles. In front of the delta are sandbanks and rocks which prevent the passage of vessels except by a canal, 18 m. long, 124 to 226 ft. wide, and admitting vessels with a draught of 18½ ft., from Kronstadt to Leningrad. When Lake Ladoga sends down its vast accumulations of block-ice, inundations of a dangerous kind occur, as in 1777, 1824, 1879, 1903, and especially in 1924.

According to observations extending from 1706 to 1899, the mean day of the freezing of the Neva is Nov. 25, the earliest Oct. 28, the latest Jan. 9, and the next latest Dec. 26. The mean day of opening is April 21, the earliest March 18, the latest May 12.

NEVADA, popularly known as the "Sagebrush" State, is one of the far western States of the American Union. It lies between 35° and 42° N. and 114° 2' and 120° W. and is

bounded north by Oregon and Idaho, east by Utah and Arizona, south and west by California. The Colorado river separating it in part from Arizona is the only natural boundary the State possesses, the others being arbitrary lines of geodetic measurement. Nevada ranks sixth among the States in size, having an area of 110,690 sq. m., 869 sq. m. of which are water surface. Its extreme length north and south is 484 m., and its extreme width east and west is 321 miles. Its name, a Spanish word meaning "snow-clad," was originally applied to the snow-capped Sierra Nevada range on the Pacific slope.

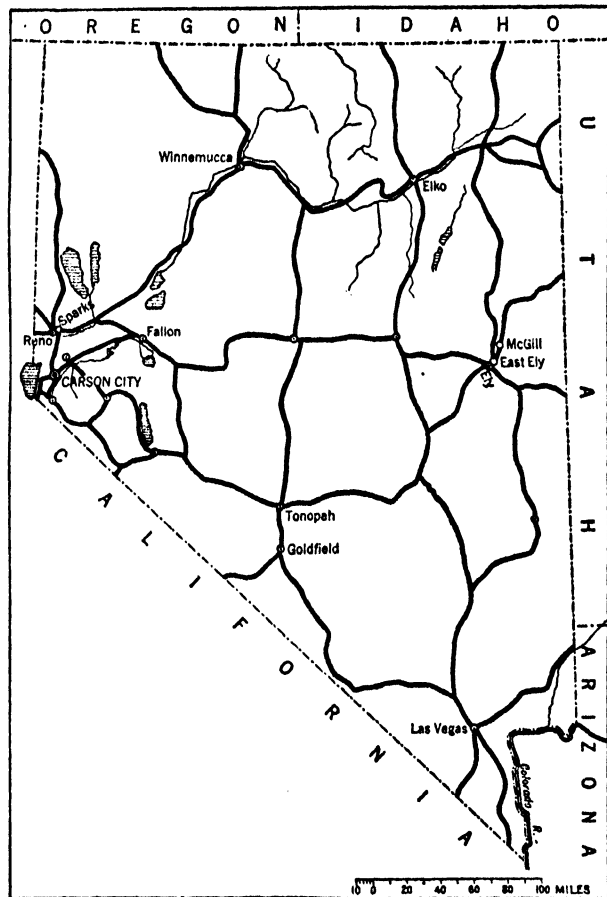

Physical Features.—With the exception of its north-east and south-east corners, the State lies wholly within the Great Basin, the floor of which is really a vast tableland between 4,000 and 5,000 ft. above the sea. This plateau, however, is not a plain, but contains many buttes, mesas and isolated mountain ranges, the latter running generally in a north and south direction and rising 1,000 to 7,000 ft. above the level of the plain. These ranges are from 5 to 20 m. wide at their bases, and the valleys between are about the same width as the bases. The total area of the valleys is about equal to that of mountainous land. In the north-east an unnamed range of highlands, broken and ill-defined, with a general east and west trend, forms the water-parting be-

tween the Gulf of California. The Colorado leaves Nevada at an altitude of but 470 ft. above sea-level, the lowest point in the State. The mean elevation of the State is 5,500 ft. and, with the exception of the dip to the Colorado in the south-east, the entire State lies above the 2,000 ft. line.

The Sierra Nevada range, which forms the western rim of the basin, sends into the State a single lofty spur, the Washoe mountains. At the foot of this range there is, relatively speaking, a depression, with an altitude of about 3,850 ft. above the sea, which receives the drainage of the eastern slopes of the Sierra. and what little drainage there is in the northern half of Nevada. From this depression eastward the general level of the plateau rises to an elevation of 6,000 ft. near the eastern borders of the State. The mountain ranges also increase in height and importance as far as the East Humboldt range, a lofty mass about 60 m. west of the Utah boundary. This range is the water-parting for nearly all the westward-flowing streams of the State, and is by far the steepest and most rugged within Nevada, a number of its peaks attaining a height of 11,000 or 12,000 feet. On its eastern slope the waters soon disappear within the bed of narrow canyons, but break out again at the foot in ice-cold springs that form the source of the Ruby and Franklin lakes; on its western side the descent is more gentle, and the waters form the south fork of the Humboldt river. The Humboldt is the most important of the basin streams. Rising in the north-east it flows in a tortuous channel in a general south-west direction for 300 m. and drains 7,000 or 8,000 sq. miles. It empties into Humboldt lake, the overflow from which goes into the so-called Carson sink. At no part of its course is it a large river and near its mouth its waters are subalkaline. The Truckee, Carson and Walker rivers flow with more vigour, receiving their waters from the eastern slopes of the Sierra Nevada range and discharging them into alkaline lakes. Of these lakes Pyramid is the largest, being about 33 m. long and 14 m. wide. Walker lake is as long but only six or seven miles in width. These larger lakes always contain water, varying only in area and depth, but the smaller lakes usually evaporate in the course of the summer. The latter are formed by waters that fall on barren mountain-sides and rush down in torrents, forming in the valleys shallow bodies of water yellow with mud held in suspension. Excepting the "alkali flats" no portion of the desert is devoid of vegetation, even in the driest seasons. In the Washoe mountains there is a heavy growth of conifers extending down into the valleys; but in many places these mountains have been almost deforested to provide timber for the mines. In other places these areas have been incorporated into national forests, in the endeavour to protect and foster the growth of timber and vegetation so as to regulate the drainage of the State. On all but the lowest ranges of the basin the piñon and juniper are found, but these rarely grow to a height over 15 ft.; and on the principal ranges above 6,800 ft. is the stunted mountain mahogany. But except for these infrequent wooded areas, the mountains are even more bare than the valleys, because their shrubs are dwarfed from exposure. The valleys are covered with typical desert shrubs, greasewood, creosote bushes and sagebrush, and with bunch grass, which is valuable for grazing. The skies of Nevada are clear nearly every day in the year. The mean annual precipitation varies from 3 in. in the south-west (Esmeralda county) to 12 in. in the east (White Pine county), and varies also according to altitude. Snow rarely lies on the ground in the valleys.

Government.—Nevada is governed under its original Constitution, adopted in 1864, and since amended in important respects. Proposed amendments must be passed by a majority in both houses of two consecutive legislatures before they can be submitted to the people.

The legislature, composed of a senate and assembly, meets regularly in January of every odd-numbered year, its sessions being limited to 60 days. The Constitution requires that the number of senators shall be not less than one-third nor more than one-half the number of members in the assembly, and that the membership of both houses shall not exceed 75. In 1925 there were 18 senators and 37 representatives. Senators are

MAP SHOWING THE MAIN ROADS IN NEVADA

tween tributaries of the Humboldt river in the Great Basin region and those rivers that flow to the Snake river in Idaho and Oregon and thence via the Columbia river to the Pacific ocean. This drainage area of the Snake amounts to about 5,000 sq. m., the Owyhee, Little Owyhee, Salmon and Bruneau rivers being the principal streams. In the south-east corner is the third drainage system. Here the Virgin river from Utah, after crossing the north-west corner of Arizona, enters the State and flows south-west for 60 m. until it joins the Colorado river. The latter stream flows for 150 m. along the south-east boundary towards

elected for four years—one-half the membership retiring every two years; representatives are elected biennially. The initiative and referendum were adopted by amendment in 1904.

The principal administrative officers are the governor, lieutenant governor, secretary of State, attorney general, controller, treasurer, inspector of mines, surveyor general and superintendent of public instruction, all elected for a four year term. The governor does not possess the usual sole pardoning power but serves together with the justices of the supreme court, the clerk of the supreme court and the attorney general on a board of pardons. There are many administrative boards and commissions, the most important of them being the board of finance, board of agriculture, board of stock commissioners, board of education, board of health, board of irrigation, board of examiners, Nevada tax commission, industrial commission and department of highways.

The judicial department consists of a supreme court with a chief justice and two associate justices, chosen for six years, and ten district courts, each with a district judge elected for four years. Each township has a justice of the peace chosen biennially by its voters. The Constitution provides that only three-fourths of the jurors may be required to agree to a verdict in civil cases, though the legislature has the power to require by statute a unanimous agreement. For divorce a residence in the State of three months is necessary.

The county is the principal unit of local government. There were (1928) 17 counties in the State, some as large as several eastern States put together.

Population.—In 1860 Nevada's population was 6,857. The mining rush increased it to 42,491 by 1870 and 62,266 by 1880. The years of depression following showed their effect in the decrease to 45,761 by 1890 and 42,335 by 1900, the latter year registering the lowest ebb in the State's fortunes. The new mineral discoveries and new prosperity again raised the population to 81,875 in 1910. In 1920 it registered 77,407. Nevada not only has the smallest population of all States in the Union, but is the most sparsely settled, with only 0.7 person per sq. mile.

Whites numbered 70,699 or 91.3% of the population in 1920. There were 4,907 Indians, 754 Japanese, 689 Chinese and 346 negroes. Of the white population 14,802 (20.9%) were foreign born. Italy and the United Kingdom plus Ireland furnished about 2,500 each, while Scandinavia, Germany, Spain, Canada and Mexico each contributed about 1,200. The urban population increased from 16.3% in 1910 to 19.7% in 1920, amounting in the latter year to 15,254 persons. The leading city, the commercial and financial centre of the State, is Reno with a population in 1925 estimated at 12,665. Carson City with a population of 1,685 in 1920 is the capital.

Finance.—The State legislature authorizes all expenditures, and in turn fixes a tax levy which shall produce revenue enough to meet these expenditures. The supervision of the assessment and collection of taxes is in the hands of the Nevada tax commission consisting of the governor, acting as chairman, and six commissioners appointed by him.

The receipts of the State in 1926 amounted to \$4,284,929, the expenditures to \$4,180,147. There was a treasury balance Jan. 1, 1927, of \$1,193,558. As in most States, a large share of the receipts is derived from general taxation, the amount from this source in 1926 being \$1,388,238.

The State had bonds outstanding Jan. 1, 1927, to the amount of \$1,812,000, incurred mostly for State building and highway purposes. This amount was more than offset by bonds and securities held by the State amounting at par value to \$3,049,807.

In 1926 there were 34 banking institutions in the State—10 of them national banks—with total resources and liabilities of \$45,209,000 and capital, surplus and undivided profits amounting

to \$4,894,000. Their deposits totalled \$36,110,000, of which \$19,365,000 were time deposits. The latter figure may be compared with savings deposits of \$13,316,000 in 1921.

The value of all tangible property in the State was estimated in 1922 at \$542,000,000 as compared with \$454,000,000 in 1912. The 1926 assessment for tax purposes amounted to \$204,000,000.

Education.—The governor, superintendent of public instruction and president of the University of Nevada compose the State board of education. There were, in 1926, 319 elementary schools, 32 district high schools and 20 county high schools. Isolation and districts of small population make first-class results difficult. Of the elementary schools 217 were housed in one-room buildings. There were ten consolidated and 11 joint district schools. In the grade schools 12,359 pupils were enrolled and in the high schools 2,810. There were 833 teachers, of whom 709 were women. The expenditure for each child of school age in 1925 was greater in Nevada (\$121.65) than in any other State except California.

The only institution of learning of college rank is the University of Nevada located on an eminence overlooking the city of Reno. Its enrolment during the regular session 1927-28 was 1,000. The new Clark Memorial library, completed in 1927, contains about 47,000 volumes. The Mackay School of Mines, founded and endowed by the family of John W. Mackay, one of the "bonanza kings" of the Comstock Lode, is an excellent and well-equipped department. A meteorological observatory is maintained at the top of Mount Rose.

Charities and Corrections.—A State orphans' home is located at Carson City, a State hospital for mental diseases at Reno, and a home for male juvenile delinquents at Elko. The State penitentiary is at Carson City.

Agriculture and Live Stock.—Nevada is the most arid State of the United States because the high Sierra Nevada range interrupts the moisture-laden clouds from the Pacific. East of these mountains, the valleys, however rich their soils, are covered with sagebrush and appear like monotonous desert wastes, except where some stream annually overflows its banks to create natural meadows, or where the land has been cleared of sagebrush and artificially watered. Agriculture is dependent almost entirely upon irrigation; how much so is shown by the fact that of approximately 594,000 ac. of improved farm land contained in the State in 1919, 561,447 were under irrigation. In 1920, 1,382,036 ac. were included in all the irrigation enterprises of the State which up to that time had cost a total of \$14,754,280. Of these 561,447 ac. were irrigated in 1919 and 331,177 ac. cropped. The value of the crops produced was \$12,390,593 or \$37.41 per acre. The cost per acre for operation and maintenance was \$0.79.

The pioneer farmers of the State settled in the valleys where fertile bottom lands grew an abundance of wild hay for their stock, which ranged far and wide over the public domain. Gradually they supplemented the natural crop with tame hay, principally alfalfa. The hay crop in 1926 was still of first importance, amounting to 680,000 tons valued at \$6,900,000, while the estimated value of all Nevada's crops in 1926 was but \$9,000,000. In southern Nevada, figs, pomegranates and cotton are raised. Vineyards are to be found here and on the Truckee-Carson project. About 8,000 bu. of peaches and 6,000 bu. of pears were grown in 1926.

The total number of cattle decreased from 419,000 in 1925 to 366,000 in 1927, but their value in these years increased from \$10,760,000 to \$14,331,000. Most of these were raised for beef purposes, the number of milch cows numbering but 20,000 in 1927. The sheep of the State, valued in 1920 at \$13,834,000, dropped in value in 1922 to \$5,736,000, but increased to \$9,529,000 in 1924 and in 1926 were valued at \$13,721,000. In 1927 there were 1,250,000 sheep in the State. The 1926 wool clip amounted to 8,730,000 lb. or 7.9 lb. per fleece.

The farm population of Nevada, contrary to the trend in most of the mountain States, increased from 16,164 in 1920 to 17,034 in 1925, amounting in the latter year to 22% of the total population. The number of farms increased from 3,163 to 3,883 and the acreage of farm land from 2,357,000 to 4,091,000. The latter figure represents but 5.8% of the total land of Nevada, a smaller proportion than is to be found in any other State. The average

GRAPH OF GROWTH OF POPULATION IN NEVADA, WITH FOREIGN PERCENTAGE

size per farm in 1925 was 1,053 ac. and the average value per farm \$25,260.

Mining.—From 1907 metal production steadily increased until it reached its peak in 1917, in which year gold, silver, copper, lead and zinc were produced to the value of \$54,424,580. The years 1918-21 were years of swift decline, the production in 1919 being less than one-half that of 1918, and that of 1921 but 50% of that of 1919. The industry in 1921 was everywhere in stagnant condition, several of the larger producers having closed down entirely. The whole mineral output of the State in 1921 was but \$14,038,071. The upward turn came in 1923 when the gross production of all minerals rose to \$28,598,627. In 1924 their value was \$26,225,943; in 1925, \$23,309,352; and in 1926, \$26,084,500.

During the period of depression silver was in the best condition because of the Government guaranteed price of \$1.00 per ounce under the Pittman Silver Purchase act. This expired in June, 1923, when the price of silver fell immediately to 63 cents. In 1926 it averaged approximately 51 cents per ounce in value. Production of this metal fell in consequence from 10,614,564 oz. in 1923 to 6,461,000 oz. in 1926, the lowest in many years.

Gold production also decreased from 1923-26, though slightly, its value in the former year being \$4,223,109 and in the latter \$3,707,885. The leading gold producing mine, the Comstock Merger Company, was closed in Dec. 1926.

The production of lead increased from 18,156,000 lb. in 1923 to 24,470,452 lb. in 1925 and 23,700,000 lb. in 1926. The value the latter year was \$1,967,000. Mines at Pioche and Eureka were the largest producers. Zinc production, which amounted to 14,166,000 lb. in 1923, decreased to 9,500,000 lb. in 1926, the decrease being due to the closing in the latter year of the Yellow Pine mill, long the largest zinc producer in the State. This mill has since resumed operations, using a lower grade ore.

The general increase of 12% in the metal production of Nevada for 1926 over that of 1925 was due entirely to copper, since all the other metals registered a decrease. Its output saw a phenomenal rise from 23,000,000 lb. in 1922 to 67,000,000 in 1923, 79,000,000 in 1925 and 113,616,000 lb. in 1926. The value had increased from \$3,122,967 in 1922 to \$15,679,000 in 1926. By far the larger share of the output comes from the property of the Nevada Consolidated Copper Company at Ely, which registered an average of 6,500,000 lb. a month for the first three months of 1926 and increased considerably thereafter.

Other metals commercially developed in the State are quicksilver, antimony, manganese, arsenic and tungsten.

The production of non-metals such as gypsum, borax, lime, filter clay, etc., has showed a substantial increase from 1923 to 1926. In 1923 the gypsum production was valued at \$1,952,007. Opals and turquoises of value are mined, a flawless opal, reported the largest in the world, weighing 2,566 carats and valued at \$250,000, being found in 1924.

Manufactures.—The manufacturing interests of Nevada are unimportant. There were in 1925 but 102 establishments employing 2,670 workers, paying \$4,474,000 in wages and manufacturing goods to the value of \$21,626,000, the latter an amount less than that of any State except New Mexico. In the summer of 1928 work was begun on the \$1,000,000 naval arsenal and munition plant near Hawthorne.

Transportation.—Nevada is crossed east and west by three main lines of railway, the Southern Pacific and the Western Pacific in the northern part of the State and the Los Angeles and Salt Lake (Union Pacific system) in the southern. All three are parts of great transcontinental systems. Branch lines connect the more important mining towns with these lines. Railway mileage in the State reached its peak in 1915 when it amounted to 2,332 miles. By 1925 it had decreased to 2,137 m. but the building of a new line in that year from the Idaho line to Wells, where it connects with the Southern Pacific and Western Pacific brought the 1926 mileage up to 2,201. The general decrease was due to the inroad of motor transportation. In the State highway system were 2,996 m. of road, of which 1,025 m. were surfaced.

History.—The first recorded person of European descent to enter the limits of Nevada was Francisco Garcés of the Order of

St. Francis, who set out from Sonora in 1775 and passed through what is now the extreme southern corner of the State on his way to California. Half a century later trappers of the Hudson's Bay Company led by Peter Skene Ogden entered Nevada from the north and discovered the Humboldt river. In 1827 Jedediah S. Smith, an American trader from St. Louis, crossed the State from west to east on his return from California after the first recorded journey from the Mississippi to the Pacific by the central route. In 1833 Capt. Bonneville's men were on the Humboldt, and during 1843-45 John C. Fremont made a series of explorations in the region. The first recorded emigrant train to California crossed the State in 1841. By the treaty of Guadalupe Hidalgo, negotiated in 1848 at the close of the war with Mexico, Nevada became U.S. territory. It was then a part of California known as the Washoe Country, and so remained until 1850, when most of the present State was included in the newly organized Territory of Utah. One of the first settlements was made in 1849 by Mormons at Genoa in the valley of the Carson river. Here in 1851 the earliest recorded public meeting in the State was held to frame a government for the settlers since the seat of the Territorial Government of Utah was considered too remote to afford protection to life and property. But the Utah authorities intervened and in 1854 the Utah legislature created the county of Carson to include all settlements in western Utah. In 1858 Carson City was laid out, and in the following year the people of Carson county chose delegates to a Constitutional Convention which met at Genoa and drafted a Constitution. It was adopted by vote of the people, but this attempt to create a new State Government proved abortive, and it was not until the mineral wealth of the Washoe Country became generally known that Congress took action. In 1861 the Territory of Utah was divided at 39° W. (of Washington) and the western portion was called Nevada. The Comstock Lode, one of the richest deposits of precious metal known in the world, was discovered in 1859, and Nevada ceased to be merely a highway for gold-seekers on the way to California and became a stopping-place. Virginia City became the most famous of all the mining camps of the Far West.

An attempt to win Statehood in 1863 was defeated, but in 1864 when it became evident that two more Republican votes were needed in the U.S. Senate for reconstruction purposes, party leaders at Washington urged the people of Nevada to adopt a Constitution and enter the Union as a patriotic duty. The third Constitutional Convention in its history met at Carson City and drew up a Constitution which was duly ratified, and in October of that year, President Lincoln proclaimed the new State. The eastern boundary was pushed eastward to its present location on the 37th meridian (W. of Washington) in 1866, and the southern boundary was also fixed in that year. Being "battle-born," Nevada was loyal to the Union throughout the Civil War, and furnished a company of troops in 1861 which was joined to a California regiment. In 1863 the Territory raised six companies of infantry and six of cavalry (about 1,000 men), which saw no actual service against the Confederates but were useful in subduing hostile Indians.

The history of the State since its organization has been largely a history of its mines. From 1864 to 1868 there was a general reaction in the industry due to unwarranted speculation and inflated values. After 1868 there came a period of consolidation, of more systematic workings, and of deeper development. In 1873 came the discovery of the "big bonanza" by Mackay, Fair, O'Brien and Flood, who became the four "bonanza kings" of Nevada. In 1873, \$21,000,000 was taken from the Comstock and production increased until the maximum of \$36,000,000 was reached in 1878. The Suto Tunnel intersected the lode in the latter year, and drained the mines. But the richer workings soon proved below the tunnel level and the shafts were sent deeper. In 1882 an immense flow of hot water was struck which flooded the principal mines up to the Suto Tunnel level. The miners were forced to return to the upper levels and work the lower grade ores. Production decreased and with the end in sight the market slumped. Also, the National Government had abandoned its artificial maintenance of the price of silver. The period of depression lasted until

about 1900 when the discovery of a new mineral belt in southern Nevada brought renewed prosperity. Tonopah, 60 m. from the railroad, became the new Mecca, and fast upon the heels of its discovery came that at Goldfield. A railway was completed to the new camps in 1904 and Tonopah has since been one of the largest and steadiest producing districts of the State. Copper ores of vast extent were discovered at Ely at about the same time and the Nevada Northern railway was completed to this camp in 1907.

The depression immediately before 1900 served a good purpose in turning attention to the agricultural and live stock possibilities of the State. The river valleys under irrigation proved most fertile and these were soon settled by large-scale ranchers. On the river bottoms the ranchers raised their hay, and controlled a still larger acreage of the upland grazing ground. Private irrigation systems were supplemented by Federal undertakings the most notable being the Truckee-Carson project. Many beautiful valley towns now have their prosperity founded on the permanent basis of agriculture rather than the uncertain one of mining.

Until the silver agitation of the '90s Nevada was safely Republican. State politics in the early period were replete with corruption, mining interests buying influence with a lavish hand. Nevada also earned the name of the "Rotten Borough" in the U.S. Senate because so many of its rich mine-owners were accused of purchasing their seats in that body. An exception must be made in the case of William M. Stewart, elected as one of the first senators in 1864, who served, except for 12 years' intermission, until 1907, a span of 42 years. John P. Jones, his colleague, and perhaps an even abler man, served for 30 years, becoming one of the great leaders in the Silver movement. For four State elections the Silver Party swept the State and controlled the Administration. After the issue subsided the old parties reappeared and since have been about equal in their strength and their control of the State Government.

BIBLIOGRAPHY.—For recent conditions consult the latest reports of various State officers, departments and commissions, especially those of the treasurer, superintendent of public instruction, tax commission and State inspector of mines and the annual reports and bulletins of the Agricultural Experiment Station at the University of Nevada. For history consult Dan De Quille (William Wright), *History of the Big Bonanza* (Hartford, 1876); J. J. Powell, *Nevada, the Land of Silver* (San Francisco, 1876); H. H. Bancroft, *Nevada, Colorado, and Wyoming* (San Francisco, 1890); C. H. Shinn, *The Story of the Mine as Illustrated by the Great Comstock Lode of Nevada* (1896); I. M. Strowbridge, *In Miner's Mirage Land* (Los Angeles, 1904); Thomas Wren, *A History of the State of Nevada* (Chicago, 1904); and S. P. Davis, *The History of Nevada* (Reno-Los Angeles, 1913). F. C. Lincoln, *Mining Districts and Mineral Resources of Nevada* (Reno, 1923) is a thorough survey with complete bibliographies. See also the biennial reports and papers of the Nevada State Historical Society.

NEVADA, a city of south-western Missouri, U.S.A., 90 m. S. by E. of Kansas City, at an altitude of 860 ft.; the county seat of Vernon county. It is on Federal highways 54 and 71, and is served by the Missouri-Kansas-Texas and the Missouri Pacific railways. Pop. 7,139 in 1920 (97% native white); estimated locally at over 9,000 in 1928. It is the seat of a State hospital for the insane, and of Cotter college for girls (1884). The National Guard of Missouri has a camping ground near by. There are chalybeate and sulphur springs in one of the city's parks. Coal is mined in the vicinity, and the city has flour and planing mills, galvanized iron works, and other manufacturing industries. Nevada was platted in 1855, incorporated as a town in 1869 and chartered as a city in 1880. During the Civil War it was burned to the ground (1863).

NEVADA CITY, a city of eastern California, U.S.A., on Deer creek, at an altitude of 2,580 ft., 60 m. N.N.E. of Sacramento; the county seat of Nevada county. It is served by the Nevada County Narrow Gauge railroad and motor-bus lines. Pop. (1920) 1,782; 1928 estimate, 3,500. It is a summer resort and a supply centre for the neighbouring mining camps. The county is still an important producer of gold, with an annual output of over \$1,000,000. Gold was discovered here in the summer of 1849 by James W. Marshall, who in the preceding year had picked up the first nugget in California, near Coloma. The gold output was at its peak in 1850-51. Nevada City was incorporated in 1851 under a special act of the legislature (repealed in 1852).

It was reincorporated in 1856 and again in 1878.

NÉVÉ or **FIRN**, masses of compacted snow formed from the accumulated snow in the catchment area of a glacier, by processes of alternate thawing and freezing. The névé is the feeding ground for the valley-glaciers. (See GLACIER.)

NEVERS, a town of France, capital of the department of Nièvre, 159 m. S.S.E. of Paris by the P.L.M. railway to Nîmes. Pop. (1926) 27,328. *Noviodunum*, the early name of Nevers, was later altered to *Nebirnum*. Many medals and Roman antiquities found there show its importance when Caesar chose it as a military dépôt. In 52 B.C. it was the first place seized by the revolting Aedui. It became the seat of a bishopric at the end of the 5th century.

Having formed part of the duchy of Burgundy, the county of Nevers (Nivernais) was given by Duke Henry I. in 987 to his stepson, Otto William, afterwards count of Mâcon, from whom it passed to his son-in-law Landri. The first house of the hereditary counts of Nevers originated in Landri, and was brought to an end in 1192 by the death of Agnes, countess of Nevers, wife of Pierre de Courtenay (d. 1217). The county subsequently passed into the houses of Donzy, Châtillon and Bourbon. Nevers is on the Loire where it joins the Nièvre. Narrow winding streets lead from the quay through the town, with many old houses (14th to the 17th centuries). The cathedral of St. Cyr is a combination of two churches, one Romanesque (11th century), the other Gothic (14th century). There is a fine square (16th century) tower on the south side. The church of St. Étienne is 11th century Romanesque. The ducal palace at Nevers (now occupied by the courts of justice and an important ceramic museum) was built in the 15th and 16th centuries and is one of the chief feudal buildings in central France. An octagonal middle tower contains the great staircase, and its windows are adorned by sculptures relating to the history of the house of Clèves. The Porte du Croux, a square tower, with corner turrets (14th century), is among the remnants of the old fortifications. Nevers is the seat of a bishopric under the archbishop of Sens, of tribunals of first instance and of commerce and of a court of assizes and has a chamber of commerce.

NEVILLE or **NEVILL**, the family name of a famous English noble house, descended from Dolfin son of Uchtred, who had a grant from the prior of Durham in 1131 of "Staindropshire," co. Durham, a territory which remained in the hands of his descendants for over four centuries, and in which stood Raby castle, their chief seat. His grandson, Robert, son of Meldred, married the heiress of Geoffrey de Neville (d. 1192-1193), who inherited from her mother the Bulmer lordship of Brancepeth near Durham. Henceforth Brancepeth castle became the other seat of the house, of which the bull's head crest commemorates the Balmers; but it adopted the Norman surname of Neville (*Neuville*). Robert's grandson, another Robert (d. 1282), held high position in Northumbria, and sided with Henry III. in the Barons' War, as did his younger brother Geoffrey (d. 1285), ancestor of the Nevills of Hornby. This Robert's son Robert (d. 1271) extended the possessions of the family into Yorkshire by his marriage with the heiress of Middleham. The summons of their son Ranulf (d. 1331) to parliament as a baron (1294) did but recognize the position of the Nevills as mighty in the north country. Ralph (d. 1367) the second baron—whose elder brother "the Peacock of the North" was slain by the Douglas in 1318—was employed by Edward III. as a commander against the Scots and had a leading part in the victory of Nevill's Cross (1346), where David Bruce was captured, and by which Durham was saved. His active career as head of his house (1331-1367) made the name of Nevill a power on the Scottish march. Of his younger sons, Alexander became archbishop of York (1374-1388) and was a supporter of Richard II., attending him closely and encouraging his absolutist policy; he was one of those "appealed of treason" by the opposition in 1388, and was outlawed. He died abroad in 1392. His younger brother William, a naval commander, was a leading Lollard and a friend of Wiclif, and in 1388-1389 acted with the lords appellant.

John, the 3rd baron (d. 1388), a warden of the Scottish marches

and lieutenant of Aquitaine, a follower of John of Gaunt and a famous soldier in the French wars of Edward III., continued the policy of strengthening the family's position by marriage; his sisters and daughters became the wives of great northern lords; his first wife was a Percy, and his second Lord Latimer's heiress; and his younger son, Thomas, became Lord Furnival in right of his wife, while his son by his second wife became Lord Latimer. His eldest son Ralph (1364-1425), 1st earl of Westmorland (see WESTMORLAND, EARLS OF), married as his second wife a daughter of John of Gaunt and secured heiresses for five of his sons, four of the younger ones becoming peers, while a fifth, Robert, was made bishop of Durham (1438-1457). Among his daughters were the duchesses of Norfolk, Buckingham and York (mother of Edward IV. and Richard III.) and an abbess of Barking. The Nevills were thus closely connected with the houses of Lancaster and York, and had themselves become the most important family in the realm. Of the earl's sons by his second marriage, Richard, earl of Salisbury (and three of his sons) and William, earl of Kent, are the subjects of separate notices.

The greatness of the Nevills centred in the "kingmaker" (Richard's son) and the heads of his house, after the 1st earl, were of small account in history, till Charles, the 6th earl, at the instigation of his wife, Surrey's daughter, joined Northumberland in the fatal northern rising of 1569 to the ruin of his house. His estates, with the noble castles of Brancepeth and Raby, were forfeited; Middleham, with the Yorkshire lands, had been settled by the 1st earl on the heirs of his second marriage.

Although the senior line became extinct on the earl's death abroad (1601), there were male descendants of the 1st earl remaining, sprung from George and Edward, sons of his second marriage. George, who was Lord Latimer, was father of Sir Henry, slain at Edgcote fight, and grandfather of Richard, 2nd lord (1469-1530), a soldier who distinguished himself in the north, especially at Flodden Field. His grandson (d. 1577) was the last lord, but there were male descendants of his younger sons, one of whom, Edmund, claimed the barony, and after 1601 the earldom of Westmorland, but vainly, owing to its attainder.

The heirs male of Edward, Lord "Bergavenny" (now "Abergavenny" co. Monmouth), who died in 1476, have retained their place in the peerage under that style to the present day. In 1784 the then Lord Abergavenny received an earldom, and the next lord erected at Erridge, Sussex, the present seat of the family, on which the marquise of Abergavenny and earldom of Lewes were conferred in 1876. Its Sussex estates are derived through the Beauchamps, from the Fitz Alans, heirs of the Warennes.

For the Kingmaker, see Oman's monograph (1891).

NEVILLE'S CROSS, BATTLE OF. This battle of Oct. 17, 1346, took place after Crécy (q.v.) and while Edward III. was still abroad, besieging Calais. It foiled the opportunist Scottish invasion, and assured Edward's freedom to continue his French projects. But its main interest in military history is that it affords an example of the offensive power of the new tactical combination of archers and spearmen, in contrast to Dupplin, Halidon Hill, Crécy, Poitiers and Agincourt, which were all won by awaiting the enemy's onslaught. After crossing the border, King David Bruce was surprised by the quickness with which the English, under William de la Zouch, archbishop of York, concentrated to meet him. Driven to accept battle near Durham, the Scottish king took up his position to resist attack, his pikemen formed in three great "schiltrons." The English advanced, with their left leading, and the archers on this wing overlapped and swarmed round the Scottish right flank "schiltrons." When this broke under the arrow-storm, they closed on the centre "schiltrons"—already attacked in front. Its collapse, in turn, under the converging pressure, led to the capture of the king and the hurried retreat of the remaining left division of pikemen. Thus the archers proved their power against an immobile foe to pave the

way for a successful assault by knights and men-at-arms.

NEVIN, ETHELBERT (1862-1901), American composer, was born at Edgeworth, Pa., Nov. 25, 1862. His musical talent displayed itself in childhood. He studied in Boston, 1884, before going to Berlin to continue work under Klindworth and Von Bülow, who encouraged his ability as composer. After teaching in Boston (1887-93), he returned to Europe residing for a time in Paris, Berlin, Florence and Venice as well as in Algiers. In 1900 he went back to the United States, becoming associated with Horatio Parker in the department of music at Yale university. He died at New Haven, Conn., Feb. 17, 1901. Ranked with the foremost of American song-writers, he was also the composer of many instrumental pieces, mostly in miniature form, marked by a delicate, melodious originality. Among his compositions were *Water Scenes* for the piano, including the favourite *Narcissus*; a piano suite, *In Tuscany*; the song cycles, *In Arcady* and *The Quest of the Heart's Desire*, the latter posthumously published as was also *Tempo di Valse*; a *Sketch Book* of songs and piano music; and *The Rosary*, the song that became instantly popular at a concert at Madison Square Garden, New York, Feb. 15, 1898, and has been a universal favourite ever since.

NEVIS, an island in the British West Indies, forming with St. Kitts one of the five presidencies in the colony of the Leeward Islands. Pop. (1901) 12,774. It lies in 17° 14' N. and 62° 33' W., and is separated from St. Kitts by a shallow channel 2 m. wide at its narrowest point. The island is almost circular, and from the sea has the appearance of a perfect cone, rising gradually to the height of 3,200 ft. Total area 50 sq.m. The climate is healthy, the average temperature 82° F. Sugar, molasses, cotton and coconuts are exported, and corn, yams, coffee and fruit are grown. There are medicinal springs and large deposits of sulphur. The chief town, Charlestown, lies on a wide bay on the S.W. The legislative council of St. Kitts-Nevis meets at Basseterre, in St. Kitts. Nevis was discovered by Columbus in 1498 and first colonized in 1628 by English from St. Kitts.

NEW ACADEMY. Plato's school is known as the Academy, or the older Academy. For some time after Plato's death the school continued true to his teaching. But in the third century B.C., when Arcesilaus (316-241 B.C.), was head of the Academy, there came a great change. Arcesilaus developed a sceptical philosophy in opposition mainly to the Stoics. To mark this change in the trend of its teaching the school became known as the New Academy. See PLATO; ACADEMY, GREEK.

NEW ALBANY, a city of southern Indiana, U.S.A., on the Ohio river, opposite Louisville, Kentucky; county seat of Floyd county. It is on Federal highways 31 and 150, and is served by the Baltimore and Ohio, the Chicago, Indianapolis and Louisville, the Pennsylvania, the Southern, electric railways and river steamers. Pop. (1920) 22,992 (91% native white), estimated locally at over 32,000 in 1928. The city lies on a plateau above the river, in beautiful scenery. Four coalfields are close at hand, and hydro-electric current is available. Its 46 manufacturing industries had an output in 1926 valued at \$19,500,000; the combined business of its 22 wholesale houses was \$20,000,000; and bank deposits aggregated \$14,431,472. The leading products are ply-wood, furniture, iron and steel, edge tools, engines and boilers, woollen and cotton goods, leather, fertilizer and flour. New Albany was settled early in the 19th century, plotted in 1813, and chartered as a city in 1839.

NEW AMSTERDAM, a town of British Guiana, situated in 6° 20' N. and 59° 15' W. on the east bank of the Berbice river, about 4 m. from the mouth. Formerly the capital of the colony of Berbice, it is now the capital of the county of that name. It is composed almost entirely of wooden houses, having a population in 1921 of 8,000. Colony House, standing in handsome grounds beside the botanical gardens, formerly the residence of the governor and seat of the legislature, now contains the treasury and supreme courts. New Amsterdam is connected by ferry, rail and a bi-weekly steamer service with Georgetown.

NEWARK, DAVID LESLIE, LORD (1601-1682), Scottish general, fifth son of Sir Patrick Leslie of Pitcairly, Fifeshire, commendator of Lindores, and Lady Jean Stuart, daughter of the

1st earl of Orkney. In his early life he served in the army of Gustavus Adolphus, where he rose to the rank of colonel of cavalry. In 1640 he returned to Scotland. He was major-general under Alexander Leslie, earl of Leven, at Marston Moor. He was then sent into the north-western counties, and besieged and took Carlisle. When, after the battle of Kilsyth, Scotland was at the mercy of Montrose and his army, Leslie was recalled from England in 1645, and made lieutenant-general of horse. In September he surprised and routed Montrose at Philiphaugh near Selkirk. He was then declared lieutenant-general of the forces. After a short period of service in England he returned to Scotland, and reduced several of the Highland clans.

In 1650 Newark was sent against Montrose, who was defeated and captured by Major Strachan, Leslie's advance guard commander; and later in the year, all parties having for the moment combined to support Charles II., Leslie was appointed to the chief command of the new army levied on behalf of Charles II. The result, though disastrous, abundantly demonstrated Leslie's capacity as a soldier, and it might be claimed for him that Cromwell and the English regulars proved no match for him until his movements were interfered with and his army reduced to indiscipline by the representatives of the Kirk party that accompanied his headquarters. After Dunbar Leslie fought a stubborn defensive campaign up to the crossing of the Forth by Cromwell, and then accompanied Charles to Worcester, where he was lieutenant-general under the king. On the defeat of the royal army Leslie was committed to the Tower, where he remained till the Restoration in 1660. In 1661 he was created Lord Newark, and received a pension of £500 per annum. He died in 1682. The title became extinct in 1790.

NEWARK, a town and municipal borough of Nottinghamshire, England. Pop. (1921) 16,958. It lies on the Devon near its junction with the Trent, and is connected with the Trent navigation by a canal $1\frac{1}{2}$ m. in length. It is 120 m. N.N.W. from London by the L.N.E.R. Newark owed its origin, possibly in Roman times, to its position on the great road called the Fosse Way, in the Trent valley. In a 7th century document it is mentioned as having been granted to the abbey of Peterborough by Wulfhere. Granted to the monastery of Stow by Godiva, it remained in the hands of the bishops of Lincoln until the reign of Edward VI. The castle was erected by Bishop Alexander in 1123, and the bridge about the same time. It was incorporated in 1549, and the charter was confirmed and extended by Elizabeth. A weekly market on Wednesdays, and a fair on the eve, day and morrow of the Invention of the Holy Cross, are still held; another fair, at St. Mary Magdalene and the four preceding days was granted by Henry III., and is probably represented by the fair now held on May 14. A market for corn and cattle is still held on Wednesdays, and another on Tuesdays for fat stock has been added. The church of St. Mary Magdalene is notable for its tower and octagonal spire (223 ft. high). Its central piers, dating from the 11th or 12th century, remain, and the lower part of the tower is Early English. The upper parts of the tower and spire are Decorated, completed about 1350; the nave dates from between 1384 and 1393, and the chancel from 1489. There are a few old monuments, and a 14th century brass. The castle is supposed to have been founded by Egbert, king of the West Saxons. It was known as the "key of the North." The Norman stronghold still shows a gate-house, a crypt and the lofty tower. The building seems to have been reconstructed in the early part of the 13th century. During the Great Rebellion it was garrisoned for Charles I., and endured three sieges. A late 15th century cross (the "Beaumont" cross) is preserved in the town. A grammar and song school was founded in the reign of Henry VIII. The town trades in malt, coal, corn and cattle. There are iron and brass foundries, boiler-works, agricultural implement manufactories and breweries. Gypsum and limestone are obtained in the neighbourhood.

NEWARK, the largest city of New Jersey, U.S.A., and the 15th in size in the United States (1920), a port of entry and the county seat of Essex county; on the Passaic river and Newark bay, 8 m. W. of lower Manhattan (New York city). It is served

by the Baltimore and Ohio, the Central of New Jersey, the Erie, the Lackawanna, the Lehigh Valley and the Pennsylvania railways and an industrial belt line; steamships operating to Atlantic, Gulf and Pacific ports, and Hudson river landings; interurban trolleys, motor-bus and truck lines in all directions; and the Hudson and Manhattan railroad, which provides 176 trains daily to and from New York city via the Hudson tubes. A State highway runs direct (across Jersey City) to the Holland vehicular tunnel. Newark Metropolitan airport (350 ac. at Port Newark) was opened in 1928 for commercial aviation, and is to be used by the post-office department as the concentration and distributing base for air mail for the metropolitan district and eastern points. Pop. (1920) 414,524 (68% native white, 28% foreign-born white and 4% negroes); 1928 local estimate 474,154. This is practically doubled by the adjacent cities and suburbs, including Elizabeth, Bayonne, Harrison, the Oranges, Belleville, Nutley, Bloomfield and Montclair.

The city has an area of 23.78 sq.m., 10.5 m. of water front, 365 m. of streets (320 m. paved), 51,138 buildings (Dec. 1927) and an assessed valuation for 1928 of \$845,831,123. The site, bordered on the east by a double S-shaped curve of the Passaic river, is generally level, but rises toward the west. Port Newark faces Newark bay at the mouth of the river. The city is laid out in an irregular pattern. It is closely built up in the business sections, largely with tall structures of modern type. Many of the older buildings are of a native brown sandstone. Broad street (120 ft. wide) and Market street (90 ft.) are the principal thoroughfares, and their intersection (the "Four Corners") is one of the busiest traffic spots in the world. Near by is Military park (an irregular plaza used in colonial days as a drill ground), surrounded by public and semi-public buildings (including the Public Service terminal, completed in 1916) and containing a magnificent bronze group of 48 figures on a gigantic scale by Gutzon Borglum, "The Wars of America." Facing Washington park, also near the heart of the city, are the public library and the Newark Museum of Industry, Art and Science (opened 1926). Conspicuous among the city's business structures are the buildings of the Prudential and various other insurance companies. The county court house, designed by Cass Gilbert, has mural decorations by well known American artists, and in front of it is Gutzon Borglum's seated statue of Lincoln (in bronze). The hall of records, opposite the court house, was completed in 1928. Center market (1923) is one of the best equipped municipal markets in the country. Contracts have been made (1928) for the construction of a new union railway and trolley station. Among the noteworthy old buildings are the Trinity Episcopal cathedral, near Military park, built in 1743 and used as a hospital during the Revolution, and the House of Prayer with its stone rectory. There are 38 playgrounds, with a combined area of 110 ac., and the parks within the city limits cover 734 ac., of which 704 ac. are part of the Essex county park system aggregating 3,484 acres.

Since 1917 the city has operated under a commission form of government. Five commissioners, elected at large every four years, constitute the governing body. Each commissioner is the director of one of the five departments of the city's business (public affairs, public works, finance, public safety, parks and public property) and the director of the department of public affairs serves as mayor. The public schools are administered by a non-partisan appointed board. On the initiative of the chamber of commerce, the council-manager form of government has been under discussion among the citizens since 1924. The city's water-supply from the Pequannock river (55,000,000 gal. daily) has been increased by the development of the Wanauque watershed (a joint undertaking by several municipalities of northern New Jersey) which will supply a total of 100,000,000 gal. a day, of which 40,500,000 gal. has been allotted to Newark. The sewage from Newark, Paterson and 13 other municipalities on the Passaic river is collected by a large intercepting sewer (completed 1924), carried down to a disposal plant on the Newark meadows, where it is treated for the removal of solids, and thence carried under Newark bay and Jersey City to a point in New York bay 2 m. from the shore, where the effluent is discharged at a depth of

40 ft. into strong tidal currents.

The public-school system comprises 68 elementary, 3 junior and 5 senior high, 2 vocational, 2 continuation and 17 evening schools. There are 27 parochial schools and several private academies, including Newark academy, founded in 1792. The public library and the museum (under the direction of John Cotton Dana) have been pioneers in developing unconventional methods of serving the people of an industrial community. The library has about 350,000 volumes and an annual circulation of 1,500,000. The museum has exhibits valued at over \$800,000. There are several special libraries in the city, including the Prudential Insurance Company's valuable collection on vital statistics. The Newark Institute of Arts and Sciences (1910) is an extension centre of New York university. Newark is the seat of a State normal school (1913); the Newark College of Technology (1885), which co-ordinates theoretical instruction with practical training in industrial plants; the New Jersey College of Pharmacy (1891), now affiliated with Rutgers university; and the New Jersey Law school (1908). There are 114 churches and Newark is the see of both a Roman Catholic and a Protestant Episcopal bishop. The philanthropic institutions and agencies are united in a welfare federation, and over 50 of them are financed by a single annual "community chest" campaign. The daily newspapers are the *Star-Eagle* (1796), the *News* (1883), the *Ledger* (1914) and the *Freie Zeitung* (1857). Among the weeklies are one in Polish and one in Yiddish.

Newark has long been one of the leading manufacturing cities of the country. In 1925, with 1,668 establishments, employing together an average of 66,854 workers, and producing goods valued at \$490,046,599, it ranked 14th among the cities of the United States in value of output. Over 400 new plants were established in the Newark district in 1926 and 1927. The industries are highly diversified. Among the principal products (measured by value in 1925) are electrical machinery, apparatus and supplies (\$51,564,446), paints and varnishes (\$23,271,662), leather (\$22,945,072), jewellery (\$22,301,802), chemicals (\$18,053,917) and meat products (\$17,682,863). As an insurance centre also it has long been important. The 16 large life, fire and casualty companies which have their home offices here employ some 9,000 persons in Newark and have assets aggregating \$2,100,000,000. It is an important transportation centre, by rail, highway, air and sea. Development as a seaport is comparatively recent. In 1914 the city began the creation of Port Newark (on Newark bay, south-east of the city, a part of New York harbour) as a shipping terminal and industrial centre. On the entrance of the United States into the World War in 1917 the War Department leased 133 ac. of the newly filled land for one of its largest supply bases, spending \$12,000,000 on docks, warehouses and freight-handling equipment; and the U.S. Shipping Board established a \$30,000,000 ship-yard, employing 17,000 persons, where 150 steel cargo vessels were constructed by the Submarine Boat Corporation. At the close of the war the city acquired the army base (including 9 warehouses with 2,000,000 ft. of floor space) and resumed its programme. With aid from the Federal Government the channel has been deepened to 31 ft. and widened to 400 feet. Additional land has been reclaimed for industrial sites, and by 1928 six public and 139 private docks and piers had been built. Water-borne commerce in 1927 amounted to 7,115,323 tons. Freight received and despatched by rail totalled 5,892,011 tons and express shipments 1,992,483 parcels. There are nearly 500 building and loan associations, with total assets of over \$350,000,000. The institutions for saving have deposits of about \$90,000,000. Bank debits for 1927 aggregated \$4,770,562,079.

In 1666 (following the union of the towns of the New Haven Jurisdiction with Connecticut in 1664, and the consequent secularization of the franchise) a band of about 30 Puritans from Milford, Conn., led by Robert Treat, settled at "Four Corners," and the next year they were joined by an equal number from Branford and Guilford. They bought practically all of what is now Essex county from the Indians for "fifty double hands of powder, one hundred bars of lead, twenty axes, twenty coats, ten guns, twenty pistols, ten kettles, ten swords, four blankets, four

barrels of beer, ten pairs of breeches, fifty knives, twenty horses, 1850 fathoms of wampum, six ankers of liquor (or something equivalent), and three troopers' coats." The name was chosen in honour of their pastor, the Rev. Abraham Pierson (1608-78), who came from Newark-on-Trent. For 50 years or more the town remained essentially Puritan and was governed largely according to the Mosaic Law. About 1730 Presbyterianism superseded Congregationalism, and in 1734 Col. Josiah Ogden (who had caused a schism by saving his wheat one dry Sunday in a wet season) led in founding the first Episcopal church (Trinity). Newark was incorporated as a township in 1693 and was chartered as a city in 1836. The townships of Orange and Bloomfield were set off from it in 1806 and 1812 respectively. From 1747 to 1756 the College of New Jersey (now Princeton university) was carried on here, under the presidency after the first few months of the Rev. Aaron Burr, who published in 1752 his famous textbook, the *Newark Grammar*. The manufacture of leather (especially patent leather) and shoes early became an important industry. There was a tannery here in 1770 and by 1837 there were 155 curriers and patent-leather makers. The jewellery industry dates from about 1830. Until the passage of the Volstead Act the manufacture of malt liquors was one of the leading industries. Newark was the home of Seth Boyden (1788-1870), called by Edison "one of America's greatest inventors," who invented the processes for making patent leather (1818) and malleable cast iron (1826), besides many new machines and many improvements on older apparatus; and of the Rev. Hannibal Goodwin, who in 1887, in the attic of the rectory of the House of Prayer, invented the flexible film which made the motion picture possible. After the European revolutions of 1848 Newark received an influx of foreign-born, notably Germans. The city's population was 38,894 in 1850; 71,941 in 1860; 136,508 in 1880; and 246,070 in 1900. Between 1900 and 1910 it increased 41%; between 1910 and 1920, 19%. There has been no important annexation of territory (except at Port Newark) since 1905.

NEWARK, a village of Wayne county, New York, U.S.A., 30 m. E. of Rochester, on the State Barge canal, and served by the Marion, the New York Central, the Pennsylvania, the West Shore and electric railways. Pop. (1920) 6,964 (87% native white). Twenty miles north are the summer resorts on Sodus bay (Lake Ontario), and Lakes Seneca and Canandaigua lie 15 m. and 18 m. respectively to the south. Newark has extensive nurseries and a great variety of manufacturing industries, with a combined pay-roll estimated at \$1,750,000 annually, and an aggregate business of \$15,000,000. It is the seat of a State school for mental defectives. The village was founded about the time of the opening of the Erie canal (1825) and was incorporated in 1839.

NEWARK, a city of central Ohio, U.S.A., 33 m. E. by N. of Columbus, at the confluence of the north and south forks of the Licking river; the county seat of Licking county. It is served by the Baltimore and Ohio, the Pennsylvania and electric railways. Pop. 26,718 in 1920 (92% native white); estimated locally at over 30,000 in 1928. The city lies 820 ft. above sea-level, in a broad, fertile valley, surrounded on three sides by low hills. It is a division point of the Baltimore and Ohio, which employs 2,000 persons in its offices, shops and freight-yards; and has important and diversified manufacturing industries, with an output in 1925 valued at \$26,392,153. Stoves, glass, freight-cars and automobiles are leading products. At Heath, 2 m. S.W., there is a large oil refinery. Granville, 6 m. west, is the seat of Denison university (Baptist, 1831). In Newark and its immediate vicinity are some of the most extensive remaining earthworks of the mound builders, occupying 4 sq.m. when first noticed (about 1800) by the white settlers, at which time they were covered with dense forests containing trees over 500 years old. They are of great variety, including a circular enclosure of 50 ac., connected by parallel banks with an octagonal mound (20 ac.), and a *bas relief* 6 ft. high in the form of a spread eagle measuring 240 by 210 feet. Newark was laid out about 1801 and was incorporated in 1813.

NEWARK WORKS. An elaborate and complicated group of prehistoric works at the junction of two branches of Licking river, near Newark, Licking county, Ohio. Situated on a plain

30 to 50 ft. above the bottom land, the works consist of a series of square, circular, and octagonal enclosures, with mounds, ditches and connecting avenues spreading over nearly four sq. miles. They are composed of two groups, nearly two m. apart, connected by two walled avenues averaging 200 ft. wide. The western group consists of a large circle, 3 to 14 ft. high and with a mean diameter of 1,054 ft., connected with a symmetrical octagon by an avenue 300 ft. long and 80 ft. wide. Outside the octagon are two small circles, and at each corner of the octagon is a gateway, opposite which and 60 ft. within is a small mound 3 to 6 ft. in height. The length of the walls between the centres of the gateways averages 621 ft., from which the greatest variation is only four ft., except in one wall that falls 8 ft. short of the average. From the S. side of the octagon a walled avenue stretches southward two m. or more, and from near its E. side two similar avenues extend eastward with a low wall on each side, one connecting with the square of the eastern group, the other running E. to the descent to the lowland north of the square. Disposed along these avenues are circles. The eastern group of the works consists of a large circle connected with the square mentioned by a broad avenue and several adjoining lines of walls. The wall of the circle is accompanied with an inside ditch 28 to 40 ft. wide and 8 to 13 ft. deep, while the wall itself is 35 to 55 ft. wide at the base and from 5 to 14 ft. high. There is a gateway at the N.E. with flanking extensions of the wall into the walled avenue leading to the square, the sides of which are 926 to 951 ft., yet the angles at the corners do not vary from the right angle more than one degree.

NEW BEDFORD, a city of Massachusetts, U.S.A., 56 m. S. of Boston at the mouth of the Acushnet river, on an arm of Buzzard's bay; a port of entry and one of the county seats of Bristol county. It is on Federal highway 6, and is served by the New York, New Haven and Hartford railroad, interurban trolley and motor-bus lines, and steamboats. Pop. (1920) 121,217 (40% foreign-born white, including the largest colonies in the country from the Atlantic Islands and Portugal, and large numbers also of French-Canadians and English). The city occupies about 20 sq.m. along the west side of the river and harbour, opposite Fairhaven, with which it is connected by two highway bridges. It is in the heart of the summer-resort region of southern New England, and is the port of sailing for the islands of Nantucket and Martha's Vineyard. The harbour is a tidal estuary, with a 25 ft. channel 300 ft. wide and a 14 ac. turning basin. The State pier, completed in 1917, is a modern steamship terminal, 670 ft. long, with large storage space, built by the Commonwealth of Massachusetts. Boulevards almost encircle the city, including a broad drive along the shore of the harbour to Clark's point, where Ft. Rodman (erected during the Civil War) guards the entrance. There are some handsome modern buildings, including the post office, the municipal building, the library and the high school. The library, established by a private society in 1802 and taken over by the city in 1853, was one of the first free public libraries in America. It has a fine collection of whaling prints and other material relating to the industry, and much material relating to the Quakers. The Bourne Whaling museum contains, among other exhibits, a full-rigged whaleship completely equipped; and in the Seamen's Bethel (1831) just across the street are the memorial tablets described by Melville in *Moby Dick*. The last of the full-rigged whalers, the "Charles W. Morgan," set in a concrete basin on the estate of Col. E. H. R. Green at South Dartmouth (9 m. S.W. of New Bedford), is kept as a museum. Free educational opportunities, in addition to those provided by the public-school system, are offered by a State Textile school, the New Bedford Vocational school and the Swain Free School of Design. The morning newspaper, the *Mercury*, was established in 1807. Daily papers are published in French and in Portuguese.

New Bedford has long been one of the principal centres for the manufacture of fine cotton goods. It ranks second only to Washington in the proportion of women employed in gainful occupations (42% in 1920) and second only to Fall River in the proportion of children 10 to 14 years of age so employed (17% in 1920). Its aggregate factory output in 1925 was valued at \$143,551,349,

of which \$100,589,496 represented cotton goods. It is the spot cotton market of the North, and its warehouses have a storage capacity for 300,000 bales. The traffic of the harbour in 1925 (including Fairhaven) amounted to 1,033,829 tons, valued at \$129,622,261, almost all domestic commerce. In addition, there are large shipments of fish. The city's assessed valuation for 1927 was \$216,197,725. Bank debits for 1927 aggregated \$364,352,000.

The site of New Bedford was visited in 1602 by Gosnold, who traded with the Indians at the mouth of the Acushnet. It was originally part of the town of Dartmouth, settled in 1652 by colonists from Plymouth, who purchased the land from Massasoit. About 1665 there was a considerable influx of Quakers, who have ever since been an important and influential element in the population. There was no village on the site of the present city until 1760. In 1787 New Bedford was set off from Dartmouth and incorporated as a town, and in 1847 it was chartered as a city. Fairhaven was separated from it in 1812. The town was at first called Bedford (the family name of Joseph Russell, one of the founders), and later New was prefixed to distinguish it from Bedford in Middlesex county. On May 14, 1775, a local ship captured two armed British sloops just outside the New Bedford harbour. During the Revolution the harbour was a rendezvous of American privateers, and this led to an attack (Sept. 5, 1778) by a fleet and armed force under Earl Grey, which burned 70 ships and almost destroyed the town. The whaling industry became established here after Joseph Rotch, a Nantucket merchant, in 1765 built wharves and warehouses on the west side of the harbour, and New Bedford was long the principal whaling port of the world. For more than a century the industry flourished, with interruptions due to the Revolution, the Embargo, the War of 1812 and the Civil War, reaching its peak in 1857, when 329 whaling ships were registered, representing an investment of \$12,000,000 and employing 10,000 men ashore and afloat. The hunting grounds shifted after 1791 from off the Virginia and Carolina coast to the Pacific, and after 1848 to the Arctic waters. The first cotton-mill was built in 1847 by Joseph Grinnell (1789-1885) and his associates, and began operation in 1848 with 15,000 spindles and 200 looms. In 1928 the 66 mills making cotton yarn and cotton goods were equipped with 3,382,500 spindles (about 10% of the total in the United States) and 58,000 looms, and they produce from 35 to 40% of all the fine cotton fabrics made in the country. Because of the character of the goods made, New Bedford has suffered less than other New England cities from the competition of the new textile centres in the South.

NEW BERN, a city of eastern North Carolina, U.S.A., at the mouth of the Trent river, on the Neuse river estuary; a port of entry and the county seat of Craven county. It is on the Atlantic Coastal highway; is connected by a 12 ft. channel with the inland waterway from Boston to Beaufort; and is served by the Atlantic Coast Line and the Norfolk Southern railways and coastwise steamers. Pop. 12,198 in 1920 (55% negroes); estimated locally at 14,000 (40% negroes) in 1928. The Neuse river is 14 m. wide here, and it widens gradually to 7 m. at its entrance into Pamlico sound, 30 m. east. New Bern is a picturesque old city, on the peninsula formed by the two rivers, surrounded by forests of cypress and pines. It is the supply depot and commercial centre of the rich surrounding farm lands, and of the numerous fishing and hunting resorts of the region (Ocracoke, Morehead, Beaufort, Jacksonville, Havelock, Nags Head and Cape Lookout). Traffic on the Neuse in 1925 amounted to 258,003 tons, valued at \$9,596,720. The city's manufacturing industries include the largest lumber-mill in the South-east.

New Bern was founded in 1710 by a company of Germans and Bernese Swiss in search of religious freedom, under the leadership of Baron Christopher de Graffenried, and was incorporated as a city in 1723. The general assembly met here in 1738. In 1749 a printing press (the first in North Carolina) was set up, and the first academy in the province was established. For some years the city was the capital of the province, and it was the leading seaport until the Revolution. Many beautiful old buildings still stand, including one wing of "Tryon's Palace" (the residence of the royal governor, built in 1767-70, and reputed the finest structure in America at the time), the Presbyterian church (1822),

and Christ church, which has a communion service presented by George II. in 1752. The city was strongly fortified early in the Civil War, but was captured by Federal troops on March 14, 1862, and subsequent attempts by the Confederates to retake it (March 14, 1863, and Feb. 1 and 5, 1864) were unsuccessful.

NEWBERRY, JOHN STRONG (1822–1892), American geologist, was born at Windsor, Conn., on Dec. 22, 1822. He graduated from Western Reserve in 1846 and from Cleveland Medical college in 1848, and completed his medical studies in Paris. In 1851 he began the practice of medicine in Cleveland, but abandoned it to accept an appointment as surgeon and geologist with an exploring party in northern California and Oregon. His reports on the geology, botany and zoology of the expedition were published in 1857. For the next four years he was employed on similar work in the region of the Colorado river, his researches extending over a large area in Utah, Arizona and New Mexico. In 1866 he was appointed professor of geology and palaeontology at the Columbia School of Mines, New York, where he commenced the formation of a magnificent collection of specimens. In 1869 he was made State geologist of Ohio and director of the (second) geological survey of that State, and in 1884 palaeontologist to the U.S. Geological Survey. He devoted much study to Triassic, Cretaceous and Tertiary plants, and in particular to those of the Larami stage. He also carried on researches among the Palaeozoic and Triassic fishes of North America. Among his other publications may be mentioned *The Origin and Classification of Ore Deposits* (1880). He died at New Haven, Conn., on Dec. 7, 1892.

A bibliography of his publications is given in *Bulletin of Geol. Soc. of America*, vol. iv. p. 393. "Mémorial" (with portrait) by J. J. Stevenson in *American Geologist* (July 1893).

NEWBERRY, a town of South Carolina, U.S.A., the county seat of Newberry county; on Federal highways 76 and 176, 43 m. N.W. of Columbia. It is served by the Columbia, Newberry and Laurens and the Southern railways. Pop. 5,894 in 1920 (35% negroes); estimated locally at 8,000 in 1928. It is an important cotton market and cotton-manufacturing centre, with over 195,000 spindles in its mills in 1928; and is the seat of Newberry college (founded 1859). The town was settled about 1830 and was incorporated in 1894.

NEWBOLT, SIR HENRY JOHN (1862–), English author and poet, was born on June 6, 1862, the son of H. F. Newbolt, vicar of St. Mary's, Bilston. He was educated at Clifton college, and at Corpus Christi college, Oxford. He was called to the bar at Lincoln's Inn in 1887 and practised until 1899. His first book was a story, *Taken from the Enemy* (1892), and in 1895 he published a tragedy, *Mordred*; but the publication of his ballads, *Admirals All* (1897), created his literary reputation. These were followed by other volumes of stirring verse, *The Island Race* (1898), *The Sailing of the Long-ships* (1902), *Songs of the Sea* (1904). From 1900 to 1905 he was editor of the *Monthly Review*. His novels *The Old Country* (1916) and *The New June* (1909), attracted attention. During the World War he was controller of wireless and cables. He was knighted in 1915. In 1914 appeared *Drake's Drum and other Sea Songs*, and *Aladore*; his chief contribution to war poetry was *St. George's Day and Other Poems* (1918). In 1920 he published his *Naval History of the Great War*.

His other works include:—*Tales of the Great War* (1916), *The Book of the Happy Warrior* (1917), and *Submarine and Anti-Submarine* (1918), written primarily for the young; *A New Study of English Poetry* (1917); *Poetry and Time* (1919); *An English Anthology* (1921); *Studies Green and Gray* (1926); and *New Paths on Helicon* (1927).

NEW BRIGHTON, formerly a village (coextensive with the town of Castleton) of Richmond county, New York, U.S.A., but since Jan. 1, 1898 a part of the borough of Richmond, New York city. It is at the north-eastern end of Staten Island, about 6 m. S.W. of the borough of Manhattan. At New Brighton is the Sailors' Snug Harbour, founded under the will of Robert Richard Randall (c. 1740–1801), who in 1771 became a member of the Marine Society of New York (an organization for the relief of indigent masters of vessels and their families), and in 1790 bought from Baron Poelnitz the "Minto farm," about 21 ac. of land in

what is now the Borough of Manhattan. This tract, with four lots, also in what is now Manhattan, and cash and stocks to the value of about \$10,000 Randall bequeathed to a board of trustees, directing that the income should be used "for the purpose of maintaining and supporting aged, decrepit and worn-out sailors," who had served at least five years under the American flag, and that the institution established for this purpose should be called "the Sailors' Snug Harbour." The Sailors' Snug Harbour was incorporated in 1806, and its charter was amended in 1828 to permit the building of the institution on Staten Island rather than on the Randall estate, which had already greatly increased in value. In 1833 the institution, with lands covering 160 ac., was opened in New Brighton with about 50 inmates. Randall's body was removed to the grounds in 1834, and in 1884 a life-size bronze statue of him, by Augustus Saint Gaudens, was placed in front of the main building. At New Brighton are also a Home for Destitute Children of Seamen, founded in 1846 at Stapleton, Staten Island, removed to a new building on the Snug Harbour property in 1852, and the Samuel R. Smith Infirmary, founded in 1861.

See G. A. Ward, *Description of New Brighton on Staten Island* (1836); I. K. Morris, *Memorial History of Staten Island* (1900); and C. G. Kolff, *A Short History of Staten Island* (1926).

NEW BRITAIN, an island of the Bismarck Archipelago, lying east of New Guinea, in the Pacific ocean, between 5° and 6° S., and 150° E. (German, *Neu Pommern*; native, *Birara*). It formed part of the colony of German New Guinea from 1884 (when the German protectorate was declared), until 1914, when it was occupied by Australian troops, and in 1919 it was mandated by the League of Nations, to the Commonwealth of Australia, by which country it is now being administered. It is the largest and most important island of the archipelago, with a total area of 10,000 sq. miles. It is long and very narrow, almost crescent-shaped, with a mean breadth of 28 miles. Despite its small width, in 1928 it had not been crossed by a white man, except at its northern extremity, due to the fact that a high and very rugged range of mountains runs from one end to the other. Volcanic action is very evident throughout the island, especially in the north, where, close to Rabaul, are the Matupi sulphur springs. The highest peak in the island, the Father (7,500 ft.) on the north-west coast, is an active volcano, and near it are two mountains the North Son and the South Son, and not far from Rabaul are three mountains, the Mother, the North Daughter and the South Daughter, the first-named being an extinct volcano. Vulcan Island, with an area of several acres, on the south side of Blanche Bay, made its appearance in a single night, in 1870, during an eruption of Mt. Mother when violent earthquakes were experienced: earth tremors are of frequent occurrence. The coast is precipitous in some places, in others flat and fringed with coral reefs; but there are several good harbours, the best being Simpson Haven, the inlying portion of Blanche Bay; others are Jacquinot Bay, Arawe, Linden haven and Powell haven. There are no rivers of any importance, only a few short, rapid-flowing streams. The chief town and centre of administration is Rabaul, situated on Simpson haven, which is also a good port with a safe and spacious anchorage for shipping. The bulk of the white population of New Britain is settled in or near Rabaul, where sanitary conditions have improved greatly, and which has a fairly healthy climate, with a rainfall of more than 100 inches. White-owned coco-nut plantations are scattered about the island. Copra is the chief product, shipments of which from Rabaul in 1919 amounted to a value of £345,927, and there is a considerable shell fishing industry. Roads are being constructed where possible, and between Rabaul and the various islands and ports on the mainland and in Australia there is regular steamship communication. There is also telegraphic and wireless communication. The island is divided into four districts for administrative purposes, Rabaul, Kokopo (formerly Herbertshöhe, the former seat of the governor of German New Guinea), Gasmatta and Talasea, administered by district officers appointed by the administrator of the mandated territories of New Guinea.

The people are Melanesians, of good physique, akin to the aborigines of the mainland. They are considered to be very

treacherous, and cannibalism exists amongst them; but this is being stamped out as the island is opened up with roads. They are amenable to discipline, and some display considerable intelligence when trained. Pidjin English is used by European settlers in dealing with the natives, who have clean and well kept villages, and though not craftsmen in carving and pottery, are good hunters and fishermen. (See NEW GUINEA.)

NEW BRITAIN, a city of Hartford county, Connecticut, U.S.A., 9 m. S.W. of Hartford; served by the New York, New Haven and Hartford railroad. Pop. (1920) 59,316 (36% foreign-born white, including 7,804 Poles, 3,177 Italians and 2,102 Swedes); 1928 local estimate 80,000. The city has an area of 13.77 sq.m.; its parks cover 350 ac.; and it is the seat of a State normal school (established 1851) and a State trade school. It is an important manufacturing centre, with an output in 1925 valued at \$72,676,424. Hardware, cutlery and edge tools (valued at \$39,046,986 in 1925) and foundry and machine-shop products are the leading manufactures. The city's assessed valuation in 1927 was \$114,788,798. A weekly newspaper in Swedish has been published here since 1896. Settlement within the territory now occupied by New Britain began in 1687. The town of New Britain was incorporated in 1850; the city in 1871; and in 1905 the two were consolidated.

NEW BRUNSWICK, a province of the Dominion of Canada, lying between 45° 2' and 48° 3' N. and 63° 46' and 69° 3' W. Its length from north to south is 230 m., its greatest breadth 190 m., and it has a seaboard of about 550 miles.

Geological and Physical Features.—New Brunswick is characterized most of all by the transgression of strata of Carboniferous age over the worn edges of folds which may be Carboniferous or pre-Carboniferous, or both. The areas of these mainly horizontal Carboniferous beds are mostly well under 500 ft. above sea-level. The remnants of mountain axes running north-east to south-west, north of St. John, reveal Archæan and folded early Palæozoic rocks, and a good deal of land is well above the 1,000 ft. contour. Between the fold lines run remarkable lake-river feeders of the St. John river, which skirts around the south-western end of these folds. This river is remarkable for its fine scenery and is navigable for 88 m. up to Fredericton, but small boats go 65 m. further, to Woodstock, not far from the border of Maine. North of this the frontier for the most part skirts the west side of the valley up to Grand Falls, which can be reached by boats when the river is high. Above Grand Falls the river forms the boundary between New Brunswick on the north and Maine on the south, up to St. Francis, the uppermost section of the river being in Maine. The total length of this river is about 450 miles. The eastern lowland, with its horizontal layers, including some thin beds of coal, is continued eastwards into Nova Scotia. The overlying Red Permian beds attain considerable importance northwards, in Prince Edward island, across Northumberland strait. The whole of the south coast of the Gulf of St. Lawrence, from Miscou point, bounding Chaleur bay, to Sydney on the Atlantic coast of Cape Poretton island, is thus bordered by coal-bearing rocks. The main north-eastward drainage of the lowland is effected by the Miramichi river (220 m. long), flowing into a large estuary and generally navigable up to Nelson, opposite Newcastle. West of this lowland area comes a fold axis which undulates about a north-north-east to south-south-west direction, and has been thought to be related to the chains on the east side of the Hudson-Champlain depression. The fold axis forms a broad highland which reaches a 2,000 ft. level at a good many places in its northern section. The northern boundary of the province is the great Chaleur bay, stretching 90 m. inland and possessing a number of harbours. Into it flows the Restigouche river, which curves around the north-west edge of the western highland, and for some distance bounds New Brunswick against Quebec.

The coast-line of New Brunswick is indented with numerous fine bays and harbours. The Bay of Fundy is an arm of the sea separating New Brunswick from Nova Scotia and terminating in two smaller bays, Chignecto Bay and the Basin of Minas. Its length up to Chignecto Bay is 140 m. and its extreme breadth 45 m. It is noted for its high tides, which rise about 30 ft. at St. John and over 50 ft. at the head of Chignecto Bay. At Bay Verte, 14 m. distant, on the opposite side of the Isthmus of Chignecto, the tide rises little more than 4 or 5 ft. The Bay of Chaleur, which has several excellent harbours, is over 90 m. in length and from 20 to 25 m. in breadth. The other inlets of consequence on the east coast are Miramichi, Richibucto, Buc-touche, Cocagne and Shediac Bays; on the south coast are Passamaquoddy Bay, St. John Harbour and Chignecto Bay. At the mouths of the rivers are in nearly every case excellent harbours. To the province belong the islands of Campobello and Grand Manan, at the entrance of the Bay of Fundy, from both of which important fisheries are carried on.

The geological features are mantled by glacio-marine deposits, including a basal clay with *Leda Arctica*, and sands containing *Saxicava* shells. There is evidence of coastal sinking, so that many rivers flow into estuaries often bounded by cliffs on the Bay of Fundy, whereas the east coast is, for the most part low, with mosses and marshes.

Climate.—The cold air of the northern interior frequently flows over the province in winter. The average rainfall is about 40 to 45 inches. The snowfall is very heavy in the north of the province, where it exceeds 100 inches. The harbour of St. John is open throughout the year. The autumn is the best season of the year, especially during the "Indian summer," after the first frost, but before the weather has broken.

Area and Population.—Not including the territorial sea, the area of the province is 27,985 sq.m., of which 74 are water. It thus occupies an area rather larger than that of the mainland of Scotland. The population in 1921 was 387,876; in 1881 it was 321,233. There was a marked increase (10.23%) during the decade 1911–1921. The number of males slightly exceeds that of females. The bulk of the people are of English descent, the remainder Irish and French. The Scots, so prominent in nearly all the other provinces of the Dominion, are here less conspicuous. Of the original Indian inhabitants of the province, who were of Algonquin stock and divided into two tribes, the Micmacs and the Malicites, few remain, many of whom have a greater or less proportion of white blood. The principal towns are St. John (pop. 1921) 47,166, Moncton (17,488), and Fredericton, the capital of the province, with a population of 8,114.

Administration and Education.—The province sends ten senators and eleven (1926) members of the House of Commons to the Federal parliament. Since the abolition of the legislative council in 1892 the provincial legislature has consisted of a lieutenant-governor and a legislative assembly. Both city and county districts have an elective municipal system. Primary education is free and undenominational, with a compromise (1875) by which practical, though not theoretical, satisfaction is given to the Roman Catholic Church. At Fredericton there is a teachers' college and a school for the deaf and dumb. The lazaretto for lepers, at Tracadie, and the marine hospital, at St. John, are supported by the Dominion. At Fredericton is a small provincial university, founded in 1800 and re-established in 1859; at Sackville is the university of Mount Allison college, under Methodist control, and at Memramcook one, working chiefly among the French, is owned by the Roman Catholics. Their interests are more in arts than in science.

Either owing to the beauty of its scenery or to the excellence of its education New Brunswick has produced a school of poetry, headed by Charles Roberts, which is unique in the Dominion.

Agriculture.—The great predominance of the lumber industry has tended to keep agriculture in the background. The total area under field crops in 1926 was 891,631 acres. Of these, 10,916 ac. were wheat lands, 204,686 ac. oats, and 6,558 ac. barley. These, together with potatoes (42,744) and roots (12,235), formed the main crops. There were 559,019 ac. under hay and

clover. In all the river valleys, and especially on the fertile diked lands along the head of the Bay of Fundy, many rich and prosperous farms are found, varying in size from 100 to 240 acres. The raising of sheep and cattle, and the production of cheese and butter, are industries of importance.

Forests.—The State owns about 10,000 sq.m. of forest, and in 1925 the Crown and granted lands produced 405,203,000 ft. board measure. The most valuable and most widely-spread tree is the black spruce (*Abies nigra*), from which is made a yearly increasing quantity of wood-pulp for paper-making. The hemlock (*Abies Canadensis*), the cedar, birch, beech, oak, ash and many other valuable trees, are also widely spread. The chief ports for shipping are St. John, at the mouth of the St. John river, and Chatham, at the mouth of the Miramichi.

The great forests, through which flow numerous rivers with excellent harbours at or near their mouths, have long made New Brunswick a centre of lumbering. This industry has affected the whole development of the province, and the wilder and more unsettled line of its woodsmen contrasts with that of the farmer of Ontario or of the west.

In 1902 the Provincial Government set aside a large area of the highlands at the sources of the Tobique, Nipisiquit and Miramichi rivers for a national park and game preserve. Moose, caribou and deer may be shot in limited numbers during two autumn months in other parts of the province.

The game laws are being made increasingly strict, and the province draws a large revenue from the sale of licences.

Mines and Fisheries.—The mineral wealth of the province is small, though gold, iron, copper, lead, zinc and plumbago have been worked on a small scale at various times. Coal and gypsum are actively mined. Natural gas with oil is obtained near Moncton.

The fisheries, on the other hand, are extensive, though less so than those of Nova Scotia. This industry centres in the counties of Charlotte and Gloucester, herring, salmon, lobsters, sardines and cod forming the chief catch. The Restigouche, and other rivers near the northern border, are much frequented by anglers in search of trout and salmon. A large number of persons are employed (2,401 in 1925) in the fish canneries and freezing establishments.

Manufactures.—The chief manufactures, apart from the shipping of St. John, are connected with lumbering and with agriculture. The making of paper pulp and of furniture is important. Co-operation in the manufacture of butter and cheese has produced excellent results, and numerous cheese and butter factories are scattered through the province.

Communications.—The railway system links the province to Nova Scotia on the east, and to the rest of Canada on the west. In all there are some 1,941 m. of railway. The roads and rivers are also arteries of communication. There are Government owned and commercial radio stations at Red Head and St. John, with a direction-finding station at the latter as well.

History.—Until 1784 New Brunswick formed part, first of the French province of Acadia, later of the British province of Nova Scotia. The first settlement within its borders was made in 1604 by Pierre de Guast, sieur de Monts, with whom was Samuel de Champlain. Their colony at the mouth of the St. Croix river was soon abandoned, but throughout the French régime the district was frequented by bands of fur-traders. In 1762 the first English settlement was made at Maugerville, on the St. John river, and in 1764 a body of Scottish farmers and labourers took up land along the Miramichi. On May 18, 1783, a band of American loyalists settled at the mouth of the St. John. Thousands more followed, and in 1784 New Brunswick was declared a separate province. At first governed by a representative assembly and an irresponsible council, it obtained responsible government in 1847-48, after a constitutional struggle in which no little ability was shown. In 1867 it entered, without reluctance, but without enthusiasm, into the Canadian Federation.

BIBLIOGRAPHY.—Sir J. W. Dawson, *Acadian Geology* (ed. of 1891), is the most easily accessible work on the geology of the province. Numerous studies have been published, chiefly by the Geological Survey of Canada, by L. W. Bailey, R. W. Ellis, A. P. Low and

G. F. Matthew. Valuable papers on various provincial subjects have been published in the *Transactions* of the Royal Society of Canada by W. F. Ganong. The Provincial Government issues a yearly volume of sessional papers; *Acadiensis*, a magazine published in St. John, should also be consulted. The earliest account of New Brunswick is given by Nicholas Denys, *Description géographique* (published Paris, 1672; republished by W. F. Ganong, with notes and introduction, 1908); R. Montgomery Martin, *History of New Brunswick* (1837); G. E. Fenety, *Political Notes* (1867); James Hannay, *History of Acadia* (1879); and *Lives of Wilmot and Tilley* (1907); N. Denys, *Description géographique* (1672; republished, 1908); Sir J. W. Dawson, *Acadian Geology* (1891); *Canada and its Provinces* (23 vols., Toronto, 1914); *Chronicles of Canada* (32 vols., Toronto, 1914); *New Brunswick: Its Natural Resources* (Ottawa, 1921); *Canada Year Books*; Publications of the Geological Society of Canada; *Transactions* of the Royal Society of Canada.

NEW BRUNSWICK, a city of New Jersey, U.S.A., the county seat of Middlesex county; on the Raritan river, the Lincoln highway and the Delaware and Raritan canal, 30 m. S.W. of New

BY COURTESY OF THE NATIONAL AIR TRANSPORT, INC.

HADLEY FIELD. AT NEW BRUNSWICK. SHOWING A HANGAR AND AERIALS
York city and 60 m. N.E. of Philadelphia. It is served by the Pennsylvania and the Raritan River railways, motor-bus lines and freight steamers and barges. Pop. (1920) 32,779 (27% foreign-born white); 1928 local estimate 45,000. The city rises from the river to high bluffs on the east and the west, commanding wide and picturesque views. It is the seat of Rutgers university (*q.v.*) and the Theological seminary of the Reformed Church in America, the oldest theological school in the United States, founded in New York city in 1784 and situated in New Brunswick since 1810. New Brunswick is one of the oldest cities of New Jersey, and has many buildings dating from the 18th century. The Buccleuch mansion, in a 60 ac. park, presented to the city by Anthony Dey, is one of the best preserved colonial houses in the State. On York street still stands the house occupied by Gen. Howe in 1776-77. There is a fine modern stone bridge across the Raritan. The city has large manufacturing industries, employing about 15,000 persons and making a variety of products, ranging in size from motor trucks to knitting needles and valued in 1925 at \$43,453,878. Surgical and medical supplies, motor buses and trucks and fire apparatus are among its leading manufactures. The assessed valuation for 1927 was \$40,130,029. Since 1906 the city has had a commission form of government. A settlement was established here in 1681. It was at first called Prigmore's Swamp, later Inian's Ferry, until the present name was adopted in honour of the House of Brunswick. A city charter was granted by the royal governor in 1730 and by the State legislature in 1784. Washington entered New Brunswick on Nov. 28, 1776, but evacuated it on the approach of the enemy, and from Dec. 3 to April 13, 1777, it was occupied by the British under Lord Howe.

NEWBURGH, a royal burgh, Fifeshire, Scotland, on the Firth of Tay, 7 m. N.W. of Ladybank junction by L.N.E.R. Pop. (1921), 2,178. Its industries chiefly consist of the making of linen and floorcloth and quarrying; there are fisheries, especially of salmon, and a considerable trade in corn, fruit and potatoes. About 1 m. S.W. of the town stand the remains of Macduff's Cross, which marks the spot where the clan Macduff was granted rights

and sanctuary and composition for murder done in hot blood. Lindores abbey on the Tay is close to Newburgh. Of the Benedictine abbey, founded in 1178 by David, earl of Huntingdon, brother of William the Lion, there only remain the groined arch of the principal entrance, a portion of the west tower and other fragments. At Blackearnside, a forest of alders, to the east of the village, Wallace defeated the earl of Pembroke in 1298.

NEWBURGH, a city of Orange county, New York, U.S.A., on the west bank of the Hudson river, opposite Beacon, 60 m. N. of New York city. It is on Federal highway 9W; is served by the Erie and the West Shore railways, motor-bus and truck lines; and is connected by ferry with the New York Central at Beacon. Pop. (1920) 30,366 (82% native white); 1928 local estimate over 34,000. The Hudson widens at this point into Newburgh bay. The city has 2 m. of water front, with a channel deep enough for ocean-going vessels. It occupies a commanding position on terraces rising abruptly from the river, and from the higher points the view embraces many miles of the Hudson and reaches to the Catskill mountains on the north-west. Newburgh has a retail trade amounting to \$11,000,000 annually; a large shipping trade in orchard, farm and dairy products; and a variety of manufacturing industries, with an output in 1925 valued at \$24,095,960. The assessed valuation for 1927 was \$38,387,945. Since 1916 the city has operated under a commission-manager form of government. Newburgh was settled in 1709 by 53 Germans from the Rhenish Palatinate, led by their minister, Joshua Kockethal. Toward the middle of the century many of the Germans moved to Pennsylvania, and their lands were taken up by Scottish and English settlers, who in 1752 named the town after Newburgh, Scotland, from which some of them had come. Washington made his headquarters here from the spring of 1782 until Aug. 1783, in the Dutch farmhouse built by Jonathan Hasbrouck in 1750 (still standing in Washington park). Here he wrote his letter of May 27, 1782, rebuking Col. Nicola for the suggestion that he assume the title of king; here he made his reply to the "Newburgh Addresses" calling for action by the army to force Congress to redress its grievances; and here the arrangements were completed for demobilizing the Continental army. Newburgh was incorporated as a village in 1800 and as a city in 1865.

NEWBURN, urban district, Wansbeck parliamentary division, Northumberland, England, on the Tyne, 5½ m. W. of Newcastle by a branch of the N.E. railway. Pop. (1921) 18,830. It has collieries, and iron, steel, engineering, tool and fire-clay works, and there is a large industrial population. Newburn is of considerable antiquity. Roman remains have been discovered in proximity to Hadrian's Wall. The name of Scotswood, one of the manufacturing villages between Newburn and the city, commemorates the occupation of the town by the Scottish Covenanters in 1640.

NEWBURY, a town and municipal borough of Berkshire, England, 53 m. W. by S. of Reading by G.W.R. Pop. (1921) 12,295.

The name Newbury (new town or borough) is first mentioned by Odericus Vitalis; it is probable, however, that the manor of Uluritone, entered in Domesday as held by Ernulph de Hesdain, covered a large part of the site. The manor subsequently passed to the crown and was held by Elizabeth before her accession. In 1627 it was granted by Charles I. at a fee-farm to the corporation. Newbury was a borough by prescription; in 1187 its inhabitants are called "burgesses" and a document of the time of Edward I. speaks of it as *burgus*. It was incorporated by a charter of Elizabeth (1596), confirmed by Charles I. and Charles II. Newbury sent two representatives to the parliament of 1302.

The woollen industry declined early in the 17th century. The Weavers' Company, which still exists, was incorporated in 1601. Newbury castle, of which traces remained until the 17th century, is said to have been besieged by Stephen in 1152. An important woollen market, established in 1862, is held annually.

Newbury is situated on the Kennet, which is followed by the Kennet and Avon canal. The church of St. Nicholas is an early 16th century Perpendicular building. It is said to have been built mainly at the charge of John Winchcombe or Smalwoode (Jack of Newbury), an eminent clothier. A part of John Winchcombe's

(Jack of Newbury's) house and the Jacobean cloth hall, now a public museum, still exist. The almshouses called King John's Court are supported by a foundation known as St. Bartholomew's Hospital, to which in 1215 King John granted by charter the profits of a fair on St. Bartholomew's day. Shaw House, on the outskirts, is an Elizabethan mansion; to the north is Donnington castle, retaining a Perpendicular gateway and other fragments. The suburb of Speenhamland was formerly an important posting station on the Bath road. At Sandleford Priory, to the south of Newbury, the site and part of the buildings of an Augustinian priory (c. 1200) were utilized in the erection of a mansion in 1781. The householders of Newbury have the right to elect boys and girls to the educational foundation of Christ's Hospital. Trade is agricultural and there are breweries and flour mills.

Battles of Newbury (1643 and 1644).—These two important battles during the English Civil War, more commonly called the *Great Rebellion*, are described under the latter heading. The first, on Sept. 20, 1643, arose out of the attempt of the Royal army to bar the path of the Parliamentary forces under the Earl of Essex, which was returning to its base at Reading after raising the siege of Gloucester. Although Essex's army failed to break the Royalist line, they had made so strong a moral and material impression that the Royalists opened the road to them. The situation was reversed in the second battle, Oct. 26, 1644, when the Parliamentary army had headed off Charles I. on his way back to Oxford from Basingstoke. This was the first great manoeuvre-battle of the war.

NEWBURYPORT, a city of north-eastern Massachusetts, U.S.A., one of the county seats of Essex county; 38 m. N.N.E. of Boston, on the southern bank of the Merrimack river, 3 m. from the ocean. It is on Federal highway 1 and is served by the Boston and Maine railroad and coasting steamers. Pop. (1920) 15,618 (20% foreign-born white). It is an important manufacturing city, with a very diversified output, valued in 1925 at \$11,877,397. The commerce of its port in 1925 amounted to 41,943 tons, consisting entirely of receipts of coal, gasoline, fuel oil and lumber. There are statues of George Washington and William Lloyd Garrison (by J. Q. A. Ward and Daniel Chester French respectively) and many houses dating back to the 17th century, among them the stone "garrison" house in the form of a cross, with walls 4 ft. thick. Other houses of interest are the birthplace of William Lloyd Garrison, the homes of "Lord" Timothy Dexter and Caleb Cushing, and the Tracy mansion (1771), now part of the public library building. Indian Hill farm, birthplace of the journalist Ben Perley Poore, is 3 m. W. of the city. The Putnam Free school, now part of the public-school system, was founded early in the 19th century by an endowment from Oliver Putnam. The high school for girls (opened in 1843) was a pioneer institution. Newbury, including the site of Newburyport, was settled in 1635 under the leadership of the Rev. Thomas Parker (1595-1677) who had lived in Newbury, England. In 1764 a tract of 647 ac. was set off and incorporated as the town of Newburyport, which (with enlarged boundaries) was chartered as a city in 1851. In the early part of the 19th century Newburyport was one of the most flourishing commercial centres of New England. Fishing, whaling and ship-building were the principal interests until the Civil War, and its clipper ships were among the fastest and the best known on the seas. During the Revolution and the War of 1812 it sent out many privateers.

NEW CALEDONIA: *see* PACIFIC ISLANDS.

NEWCASTLE, DUKES OF. Within the space of a century there were no less than four successive creations of dukes of Newcastle in the British peerage. William Cavendish (*see* p. 280), nephew of the 1st earl of Devonshire, was raised to the dignity of duke of Newcastle-upon-Tyne in 1665. His son and successor Henry (1630-1691) died leaving daughters only, and one of these married John Holles (1662-1711), earl of Clare, who was created duke in 1694. This duke died also without male issue, leaving his estates to his sister's son, Thomas Pelham (*see* p. 280), who, with other dignities, had the title of duke of Newcastle-upon-Tyne conferred on him in 1715, and a second and similar ducal title (that of Newcastle-under-Lyme) in 1756. The first dukedom became

extinct at his death, but the second title was granted him with remainder to Henry Fiennes Clinton, earl of Lincoln, at once his nephew and nephew-in-law. From that time the dukedom has remained in the Clinton family. The two principal dukes are more fully noticed below.

1. WILLIAM CAVENDISH, duke of Newcastle (1592–1676), eldest surviving son of Sir Charles Cavendish and of Catherine, daughter of Cuthbert, Lord Ogle, and grandson of Sir William Cavendish and “Bess of Hardwick,” was born in 1592 and educated at St. John’s College, Cambridge. On the occasion of the creation of Prince Henry as prince of Wales in 1610 he was made a knight of the Bath, subsequently travelled with Sir Henry Wotton, then ambassador to the duke of Savoy, and on his return married his first wife, Elizabeth, daughter of William Basset of Blore, Staffordshire, and widow of Henry Howard, 3rd son of the earl of Suffolk. His fortune was immense, and he several times entertained James I. and Charles I. with great magnificence at Welbeck and Bolsover. In 1620 he was created Viscount Mansfield, in 1628 earl of Newcastle, and in 1629 the barony of Ogle was restored to his mother, this title, together with an estate of £3,000 per annum, descending to him. In 1638 he was made governor of the prince of Wales, and in 1639 a privy councillor. When the Scottish war broke out he assisted the king with a loan of £10,000 and a troop of volunteer horse, consisting of 120 knights and gentlemen. In 1641 he was implicated in the Army Plot, and in consequence withdrew for a time from the court. He was sent by Charles on Jan. 11, 1642 to seize Hull, but was refused admittance. When the king declared open war, Newcastle was given the command of the four northern counties, and had the power conferred on him of making knights. He maintained troops at his own expense, and having occupied Newcastle kept open communications with the queen, and despatched to the king his foreign supplies. In Nov. 1642 he advanced into Yorkshire, raised the siege of York, and compelled Fairfax to retire after attacking him at Tadcaster. Subsequently his plans were checked by the latter’s recapture of Leeds in Jan. 1643, and he retired to York. He escorted the queen, who returned from abroad in February, to York, and subsequently captured Wakefield, Rotherham and Sheffield, though failing at Leeds, but his successes were once more ravished from him by Fairfax. In June he advanced again, defeated the Fairfaxes at Adwalton Moor on June 30, and obtained possession of all Yorkshire except Hull and Wressell Castle. He might now have joined the king against Essex, but continued his campaign in the north, advancing into Lincolnshire to attack the eastern association, and taking Gainsborough and Lincoln.

Thence he returned to besiege Hull, and in his absence the force which he had left in Lincolnshire was defeated at Winceby by Cromwell on Oct. 11, 1643, which caused the loss of the whole county. On Oct. 27, 1643 he was created a marquis. Next year his position was further threatened by the advance of the Scots. Against prevailing numbers he could do little but harass and cut off supplies. He retreated to York, where the three armies of the Scots, Fairfax and Manchester surrounded him. On July 1, Rupert raised the siege, but on the next day threw away his success by engaging the three armies in battle, contrary to Newcastle’s desire, at Marston Moor. After this disaster, notwithstanding the entreaties of the king and the remonstrances of Rupert, Newcastle immediately announced his intention of abandoning the cause and of quitting England. He sailed from Scarborough accompanied by a considerable following, including his two sons and his brother, resided at Hamburg from July 1644 to Feb. 1645, and removed in April to Paris, where he lived for three years. There he married as his second wife Margaret (*see below*), daughter of Sir Thomas Lucas of St. John’s, Colchester. He left in 1648 for Rotterdam with the intention of joining the prince of Wales in command of the revolted navy, and finally took up his abode at Antwerp, where he remained till the Restoration. In April 1650 he was appointed a member of Charles II.’s privy council, and in opposition to Hyde advocated the agreement with the Scots. In Antwerp he established his famous riding-school, exercised “the art of manage,” and published his first work on

horsemanship, *Méthode et invention nouvelle de dresser les chevaux* (1658, 2nd ed., 1747; translated as *A General System of Horsemanship*, 1743).

At the Restoration Newcastle returned to England, and succeeded in regaining the greater part of his estates, though burdened with debts, his wife estimating his total losses in the war at £941,303. He was reinstated in the offices he had filled under Charles I.; was invested in 1661 with the Garter which had been bestowed upon him in 1650, and was advanced to a dukedom on March 16, 1665. He retired, however, from public life and occupied himself with his estate and with his favourite pursuit of training horses. He established a racecourse near Welbeck, and published another work on horsemanship, *A New Method and Extraordinary Invention to Dress Horses and Work them according to Nature* . . . (1667). He wrote also several comedies, *The Country Captain* and *The Varietie* (1649), *The Humorous Lovers* and *The Triumphant Widow* (1677). With Dryden’s assistance he translated Molière’s *L’Étourdi* as *Sir Martin Mar-All* (1688). He contributed scenes to his wife’s plays, and poems of his composition are to be found among her works; and he was the patron of Jonson, Shirley, Davenant, Dryden, Shadwell and Flecknoe, and of Hobbes, Gassendi and Descartes. He died on Dec. 25, 1676, and was buried in Westminster Abbey. By his first wife he had ten children, of whom one son, Henry, survived him, and became 2nd duke of Newcastle, dying in 1691 without male issue; the title then became extinct.

His second wife, Margaret, duchess of Newcastle (c. 1625–73), had been maid of honour to Henrietta Maria. The duchess cultivated literary composition with exuberant fervour, and kept a bevy of maids of honour obliged to be ready at all hours “to register her Grace’s conceptions.” Walpole speaks of her as a “fertile pedant.” She published *Philosophical Fancies* (1653); *Poems and Fancies* (1653); *The World’s Olio* (1655); *Nature’s Picture drawn by Fancie’s Pencil to the Life*, which includes an autobiography (1656); *Philosophical and Physical Opinions* (1655); *Orations* (1662); *Plays* (1662); *Sociable Letters* (1664); *Observations upon Experimental Philosophy* (1666); *Letters and Poems* (1676).

The Life of William Cavendish, Duke of Newcastle, by Margaret, duchess of Newcastle, has been edited by C. H. Firth (1886); it was criticized by Pepys as “the ridiculous history of my Lord Newcastle writ by his wife, which shows her to be a mad, conceited, ridiculous woman, and he an ass to suffer her to write what she writes to him and of him,” but on the other hand eulogized by Charles Lamb as a work for which “no casket is rich enough, no case sufficiently durable to honour and keep soft such a jewel.” *See also La Duchesse et le Duc de Newcastle*, by Émile Montégut (1895). The duchess’s *Select Poems* were edited by Brydges in 1813, and her *Autobiography* in 1814. The latter, edited by Lower, was published with her *Life of the Duke of Newcastle* in 1872.

2. THOMAS PELHAM HOLLES, duke of Newcastle (1693–1768), whose official life extended throughout the Whig supremacy of the 18th century, was the elder son of Thomas, first Lord Pelham, by his second wife Lady Grace Holles, younger sister of John Holles, duke of Newcastle-on-Tyne, who died in 1711, and left the whole of his vast estates to him. In 1712 he also succeeded his father in his peerage and estates, and in 1714, when he came of age, was one of the greatest landowners in the kingdom. He vigorously sustained the Whig party at Queen Anne’s death, and had much influence in making the Londoners accept King George. His services were too great to be neglected, and in 1714 he was created earl of Clare, and in 1715 duke of Newcastle-on-Tyne. He also became lord-lieutenant of the counties of Middlesex and Nottingham and a knight of the Garter in 1718, in which year he increased his Whig connection by marrying Lady Henrietta Godolphin, granddaughter of the great duke of Marlborough. In 1717 he first held political office as lord chamberlain of the household, and in 1724 was chosen by Sir Robert Walpole to be secretary of state in place of Lord Carteret. This office he held continuously for 30 years (1724–54), and only changed it for the premiership on his brother’s death. His long tenure of office was mainly due to his great Whig connections and his wealth, but praise must also be given to his inexhaustible activity and great powers of debate. He continued in office on Walpole’s fall in

1742, and became more powerful on his younger brother Henry becoming prime minister in 1743. On Henry Pelham's death in March 1754, Newcastle succeeded him as premier; but people who had been accustomed to him as secretary of state would not stand him as premier, and in Nov. 1756 he gave place to the duke of Devonshire. For his long services he was created duke of Newcastle-under-Lyme, with remainder to Henry Fiennes Clinton, 9th earl of Lincoln, who had married his niece Catherine Pelham. In July 1757 he again became prime minister—for Pitt, though a great statesman, was a bad party leader—on the understanding, according to Horace Walpole, that "Mr. Pitt does everything, the duke gives everything." Under this ministry England became famous abroad, but it gradually fell before the young king's affection for Lord Bute, who, after supplanting Pitt, became prime minister in the room of Newcastle in May 1762. The duke went into strong opposition, and lost his two lord-lieutenancies for opposing the peace of 1763. In 1765 he became lord privy seal for a few months, but his health was fast giving way, and he died in Nov. 1768. The duke was not a great man, but he was industrious and energetic. He worked tirelessly, though vainly, to hold the Whig Party together in the face of the determination of George III. to destroy it. In this if in nothing else Newcastle was statesmanlike: for it seems as though he alone clearly foresaw that calamity to the Party which only union and organization could have averted.

See *Memoirs of the Administration of the Right Hon. H. Pelham*, by W. Coxe (1829).

NEWCASTLE, a city and port of New South Wales, Australia, situated on the southern shore of the estuary of the Hunter River (*q.v.*), about 22 miles from its outlet, and 104 miles, by rail, from Sydney. It is built at the foot of, and up, a steeply-rising hill which backs the harbour (Av. ann. temps.: 72°–55° F; av. ann. rainfall: 42 in.). With a large and fertile hinterland (Hunter Valley, Northern Tablelands and Liverpool Plains) and abundant coal resources at its doors (reserves within area 15 miles W. and 7 miles S. amount to about 270,000,000 tons; reserves of total area: c. 9,000,000,000 tons), Newcastle was early a notable centre for the export of coal and primary produce. By 1922 it had exported some 186,000,000 tons (c. 1111,000,000), but since about 1900 its mines have been steadily superseded by those of the Maitland field (*q.v.*) and, at the present time, owing mainly to social and economic causes, the coal industry is severely depressed. The possession of fuel, water, food-supply, and a good commercial position, and access to raw materials have, however, steadily attracted manufacturing industries and Newcastle is now one of the leading industrial areas in the southern hemisphere. The Broken Hill Proprietary Co. (see **BROKEN HILL**; **AUSTRALIA: Metallurgical Industries**) established in 1915 at Port Waratah large-scale steel-works and these have brought in their train numerous associated industries. Newcastle's industries may be roughly classified as metallurgical and metal-working; constructional engineering and ship-building; coke and chemical industries; the making of fertilisers, cement, fire-bricks, pottery; wood-working; flour-milling and food-making; besides numerous miscellaneous types. These are conducted in Newcastle itself or in one or other of the numerous centres (*e.g.*, Port Waratah, Walsh Island, Cockle Creek, Merewether, etc.) within easy reach of the port. The harbour (comprising North Harbour, the Basin and Port Waratah) has ample accommodation, is well sheltered and has modern installation for handling cargo and especially for loading coal. The entrance is by a channel (width 500–450 yd.; av. depth 23½ ft.) between breakwaters, within which a fairway (width 500 ft., depth 32 ft.) is being cut. The port, which for hinterland trade (*e.g.*, wool) tends to be overshadowed by Sydney, has lost much owing to the shallowness of its entrance and suffers from the necessity of continuous dredging both at the entrance and alongside the wharves. In respect of trade Newcastle is the third port of Australia and the second of New South Wales. Its normal trade is of the order of £3,500,000 per ann. Exports (coal, coke, tar, etc.; frozen meat; butter, eggs; timber; pig iron, steel rails and plates, etc.; fertilisers) usually exceed imports. Some 4½–5 million tons of shipping use

the port annually, of which about 2,000,000 tons are "overseas" vessels (*i.e.*, other than interstate or coastwise). Newcastle has excellent railway connections, along the coastal lowlands, with Sydney and also northwards (Grafton, Lismore, *q.v.*). A series of (privately owned) lines serves the coal-fields and an important line taps the Hunter valley and may possibly be linked with the western system (*e.g.*, Merriwa-Tallowang). Pop. 1926/7: 100,000.

NEWCASTLE, a seaside resort of Co. Down, Ireland, on the western shore of Dundrum bay, at the foot of Slieve Donard. Pop. (1926), 2,687. It is the terminus of the Belfast and County Down railway, being 36 m. S. of Belfast. A fort guarded the passage of the river Shimna here in early times.

NEW CASTLE, a city of New Castle county, Delaware, U.S.A., at the head of Delaware bay, 6 m. S. of Wilmington. It is on Federal highway 11 and is served by the Pennsylvania railroad and steamship lines. Pop. 3,854 in 1920. It has a good harbour, important shad-fisheries and various manufacturing industries. New Castle played an important part in the territorial disputes of the Swedes, the Dutch and the English, from 1651, when Peter Stuyvesant built Ft. Casimir in the vicinity; and it was the capital of Delaware until 1777. The old courthouse may have been built by the Swedes, the Immanuel Protestant Episcopal church dates from 1689; and there are several Dutch and English colonial dwellings still standing. The city was chartered in 1875.

NEW CASTLE, a city of eastern Indiana, U.S.A., 45 m. E. by N. of Indianapolis; county seat of Henry county. It is served by the Big Four, the Nickel Plate, the Pennsylvania, and electric railways. Pop. (1920) 14,458 (96% native white), estimated locally at over 22,000 in 1928. It is the trade centre of a rich farming area; has large rose nurseries and important manufacturing industries (with an output in 1925 valued at \$17,494,962); and is the seat of the Indiana Village for Epileptics. The city was founded in 1819 and incorporated in 1839.

NEW CASTLE, a city of western Pennsylvania, U.S.A., the county seat of Lawrence county; 50 m. N.N.W. of Pittsburgh and 20 m. S.E. of Youngstown (Ohio), on the Shenango river and Federal highway 422. It is served by the Baltimore and Ohio, the Buffalo, Rochester and Pittsburgh, the Erie, the Pennsylvania and the Pittsburgh and Lake Erie railways. Pop. 44,938 in 1920 (19% foreign-born white); estimated locally at 55,000 in 1928. New Castle is an important commercial and industrial centre, with a trade population of over 100,000, and manufactures (notably tin plate and steel) valued at \$100,000,000 annually. New Castle was founded in 1802. It was incorporated as a borough in 1869 and as a city in 1875.

NEWCASTLE-UNDER-LYME, market town, municipal and parliamentary borough, Staffordshire, England, 2 m. W. of Stoke-on-Trent by the L.M.S. railway. Pop. (1921) 20,410. The parish church of St. Giles was rebuilt (1876) by Sir Gilbert Scott, with the exception of the tower, which dates from the 12th century. The free grammar school (1602), richly endowed, is now amalgamated with the Orme's school for girls. There is also a school of art. The manufacture of hats was once the staple trade. There are cotton and paper mills; and tanning, brewing, malting and the manufacture of army clothing are carried on. Partly included in the parliamentary borough is the populous parish of Wolstanton, of which the fine church has good details of the 13th century, with a massive tower and spire. The mining town of Audley lies 4 m. N.W., with a fine early Decorated church.

Newcastle-under-Lyme (Neofchastell-sur-Lyme, Newcastle-under-Lyme) is not mentioned in Domesday, but a charter was given to the town by Henry II. The town owes its name to a castle built here in the 12th century to supersede an older fortress at Chesterton about 2 m. to the north, and to the fact that it was situated under the forest of Lyme. Henry III. (1235) constituted it a free borough and other charters were granted in 1251, 1590, 1664, and 1835. Newcastle, which was originally held by the crown, was granted (1265) to Simon de Montfort, and subsequently to Edmund Crouchback, through whom it passed to Henry IV. In Leland's time the castle had disappeared "save one great Toure"; in the 17th and 18th centuries the town was flourish-

ing and had a manufacture of hats. Grants of fairs were given by Edward I., Edward III. and Henry VI.

NEWCASTLE-UPON-TYNE, city and county of a city, borough and port, Northumberland, England, 272 m. N. of London, on the L.N.E. railway. Pop. (1921) 275,009. It stands on the Tyne. The mouth of the river is 8 m. below Newcastle and its banks are lined with docks and industrial towns.

Though Newcastle owes its origin to a Roman station, its modern growth has largely destroyed traces of antiquity. Of the old walls there are slight remains. The castle, from which the town takes its name, was erected by Henry II. between 1172 and 1177 on the site of an older structure. It was originally the strongest fortress in the north of England, and its keep is now one of the finest specimens of a Norman stronghold remaining in the country. Fragments of its walls, with the principal entrance or Black Gate and the Watergate or southern postern remain. The keep, with walls 14 ft. thick, is in a state of good preservation, as is also the Norman chapel. The castle was purchased by the corporation in 1809, and a portion of it is used as an antiquarian museum. Near the castle is St. Nicholas church, forming the cathedral of the diocese of Newcastle, instituted in 1882. The diocese covers practically the whole of Northumberland, with a small portion of Cumberland. The church, which is principally Decorated, consists of nave, aisles, chancel and transepts, and the principal feature is the lantern tower, a fine specimen of early Perpendicular. Among other interesting old churches is St. Andrew's (11th century). St. John's is 14th century with an ancient front. A few fragments of the monastery of the Black Friars remain, and the chapel of the hospital of St. Mary at Jesmond is a ruin.

Some of the modern streets are spacious and handsome. Richard Grainger (1798-1861), a wealthy local architect, devoted himself to beautifying his city. The guildhall was re-erected in 1658.

Among educational establishments are the College of medicine and the Armstrong University college, both constituent colleges of the University of Durham. The royal free grammar school, founded in 1525, occupies modern buildings in Jesmond. There are also Allan's endowed schools, founded in 1705; Rutherford college and the Commercial institute; and the Laing Art Gallery, opened in 1904. The benevolent institutions include the dispensary (1777), fever house (1803), Royal Victoria Infirmary (1906), Princess Mary Maternity hospital (1923), eye infirmary (1822), children's hospital, Trinity almshouses (1492), hospital of the Holy Jesus (1682), hospital (1701) for keelmen, *i.e.*, coal-bargemen.

Newcastle is well supplied with public parks and recreation grounds. Jesmond is the chief residential suburb.

Both the Northumberland and Durham banks of the river are lined with manufacturing towns or suburbs. Of these the most important is Gateshead (*q.v.*) immediately opposite Newcastle; while those adjacent to Newcastle on the same bank are Benwell, Fenham and Walker. Newcastle is connected with Gateshead by five bridges: (1) the Old High Level bridge (1849), a toll bridge, carries L.N.E. railway with a road and footway beneath it; (2) the King Edward High Level bridge (1906), carries the L.N.E. railway only; (3) the New High Level bridge (opened Oct. 10, 1928), takes the bulk of the traffic and trams to the Great North road; (4) the Hydraulic Swing bridge (1876), the lowest bridge, takes foot and vehicular traffic; (5) the Redheugh Suspension bridge (1871), a toll bridge, takes foot and general traffic. The Roman bridge, the Pons Aelii, is said to have spanned the river where the hydraulic swing bridge now is. The suburban line to Jesmond, Gosforth and Benton was the first standard line to carry passengers by electric traction (1904).

Industries.—Newcastle owed its prosperity to its situation on a tidal river, and to its immense stores of coal, which, besides being exported, stimulated many industries. The quay in front of the town forms a thoroughfare about a mile long, and by dredging a depth of water has been obtained permitting vessels of large tonnage to approach, although the berths of the ocean steamers are farther down the river. There is a large grain ware-

house at the east end of the quay. There was severe depression in the Newcastle area in 1928.

Exports include coal, chemicals, pig-iron, iron-work, steel, iron bars, plates and castings, machinery, fire-clay goods and copper. The chief imports are fruits, wheat, maize, oats, barley, iron and steel, petroleum, sulphur ore, timber and wood hoops, iron ore and potatoes. Passenger steamers serve the principal English ports; also Baltic ports and New York; while Newcastle is one of the chief ports for the Norwegian tourist traffic.

To the industries indicated by the exports may be added glass, lead and shot, brick and tile, earthenware, tool, rope and ships'-fitting manufactures, and most important of all, shipbuilding. The Elswick works, founded by Messrs. Armstrong in 1847, and amalgamated with those of Mitchell and Co., are among the most important in the world. The construction of ships of all sorts is carried on.

History.—Newcastle owes its origin to its position on the great Roman wall and on the estuary of the Tyne. The most important Roman remains are the foundations of a bridge, attributed to the emperor Hadrian. Before the Conquest it was called Monkchester, and was destroyed (9th century) by the Danes. It was again destroyed by William the Conqueror, but Robert of Normandy raised a castle there in 1080, and from that time the town was called Newcastle. Shortly afterwards it was fortified by Robert de Mowbray, but it was taken by William Rufus in 1095. In the reign of Stephen it was seized by David, king of Scotland, and after its restoration in 1157 Henry II. rebuilt the castle and established a mint. The walls of the town are attributed to Edward I. During the 14th century Newcastle was three times defended successfully against the Scots, but in 1640 it was occupied for a year by the Scottish Covenanters under Leslie. It was then garrisoned by royalists, but again surrendered to the Scots in 1644 and Charles I. was taken there in 1646 when he had yielded himself to the Scottish army. Charters were granted by William Rufus, Henry III., Henry IV. (1400), Mary (1556), Elizabeth (1589) and James I. (1604).

The coal trade began in the 13th century, but, partly owing to the act of parliament passed in the reign of Edward I. forbidding the use of coal in London, did not become important until the 17th century. Glassmaking was a considerable trade in the 17th century, and in 1823 George Stephenson established iron works at Newcastle, where the first engines used on the Stockton and Darlington, and Manchester and Liverpool lines were made. Newcastle was represented in parliament by two members from 1295 to 1918, and since then it has had four members.

NEWCHWANG, a Chinese port city in the province of Fengtien, Manchuria (40° 41' N.; 122° 15' E.), some 30 miles above the mouth of the Liao river which enters the Gulf of Liao Tung. At the Treaty of Tientsin (1858), Newchwang was chosen as one of the ports to be opened to foreign trade, but it was Ying-tze (or Yinkow) near the mouth of the Liao river which actually became the centre of foreign settlements and was opened to trade in 1864. In recent years there has been a tendency to designate the port correctly as Yinkow, but Newchwang remains the official name of the Treaty port. The town was in 1895 occupied by and later ceded to Japan, only to be retroceded to China under foreign pressure. During the Russo-Japanese War, it was first in Russian and later in Japanese hands, but was finally restored to China at the end of the war. The outlet of the Liao River is obstructed by a bar and the port is closed by ice for three or four winter months. It has railway connection with Peking and with the main Mukden-Dairen line of the South Manchuria Railway by means of a short branch. Until 1907 Newchwang was the only Treaty port of Manchuria and it shared in the rising prosperity of South Manchuria; but in more recent years its development has been checked owing to the remarkable rise of Dairen, the southern terminus of the South Manchuria Railway.

The trade of Newchwang in 1926 was: net foreign imports, 19,324,000 Hk. Taels; net Chinese imports, 32,296,443 Hk. Taels; exports, 26,967,606 Hk. Taels; total 78,588,049 Hk. Taels.

The chief imports are foreign cotton piece goods, cotton yarn, native cottons, aniline dyes; exports mainly beans, bean-oil, bean-

cake, maize, cotton-seed and coal. Until 1908 Newchwang was the centre of the bean-oil and bean-cake industry of Manchuria and of the export trade in these and other Manchurian products, but it has since been supplanted by Dairen. It has still, however, a large number of Chinese mills manufacturing bean cake, which is mainly exported to South China, and bean oil for the Shanghai market. The product of the cotton-weaving industry of Newchwang is very cheap and durable and exceptionally popular among the peasants of South Manchuria. There are a large number of cotton-cloth weaving factories, some of which employ electric power, as well as many hosiery, ribbon and towel factories. Other industries include match-making, soap-works, glass-ware, knitting-needle factories, brick and dye-works. The sea-fisheries of the neighbourhood are very important and employ about 3,000 fishermen and 550 boats; the annual yield of fishery products being worth more than half a million yen. The Chinese population of Newchwang is 65,000 (1926) and there are also some 2,300 Japanese in the Japanese Concession.

NEWCOMB, SIMON (1835-1909), American astronomer, was born in Wallace, Nova Scotia, on March 12, 1835. He became a resident of the United States in 1853, and graduated at the Lawrence scientific school of Harvard university in 1858. He was an assistant in the American *Nautical Almanac* office 1857-61. In 1861 he became professor of mathematics in the United States navy, and was assigned to duty at the United States Naval Observatory. For more than ten years he worked with the various meridian instruments, and when the 26in. equatorial was erected in 1873 he was put in charge of that instrument. In 1877 he was assigned to duty in charge of the American *Nautical Almanac* office, a post which he held until March 1897. In 1884 he became professor of mathematics and astronomy at the Johns Hopkins university, continuing, however, to reside at Washington. He was also editor of the *American Journal of Mathematics* for many years. In view of the wide extent and importance of his labours, the variety of subjects of which he treats, and the unity of purpose which guided him throughout, Simon Newcomb must be considered one of the most distinguished astronomers of his time. A study of his works reveals an unusual combination of skill and originality in the mathematical treatment of many of the most difficult problems of astronomy, an unflinching patience and sagacity in dealing with immense masses of numerical results, and a talent for observation of the highest order. On taking charge of the *Nautical Almanac* office, he became, very strongly impressed with the diversity existing in the values of the elements and constants of astronomy adopted by different astronomers, and the injurious effect which it exercised on the precision and symmetry of much astronomical work. Accordingly he resolved to "devote all the force which he could spare to the work of deriving improved values of the fundamental elements and embodying them in new tables of the celestial motions." The formation of the tables of a planet has been described by Cayley as "the culminating achievement of astronomy," but the gigantic task which Newcomb laid out for himself, and which he carried on for more than 20 years, was the building up, on an absolutely homogeneous basis, of the theory and tables of the whole planetary system. The results of these investigations have, for the most part, appeared in the *Astronomical Papers of the American Ephemeris*, and have been more or less completely adopted for use in the nautical almanacs of all countries. A valuable summary of a considerable part of this work was published in 1895, as *The Elements of the Four Inner Planets and the Fundamental Constants of Astronomy*. In 1866 Newcomb had published an important memoir on the orbit of Neptune, which was followed in 1873 by a similar investigation of the orbit of Uranus (*Smithsonian Contributions to Knowledge*, vols. xv. and xix.). About 25 years later new tables of these planets were issued by him (*Astronomical Papers of the American Ephemeris*, vol. vii., pts. 3 and 4) based on unpublished investigations in which the elements were determined from the best available observations up to that time. In the meantime the theory of Jupiter and Saturn had been thoroughly worked out by G. W. Hill, Newcomb's distinguished collaborator in the *Nautical Al-*

manac office, and thus was completed one important section of the work projected by Newcomb in 1877.

NOTABLE ACHIEVEMENTS

Among Newcomb's most notable achievements are his researches in connection with the theory of the moon's motion. His first work on this abstruse subject, entitled *Théorie des perturbations de la lune, qui sont dues à l'action des planètes*, is remarkable for the boldness of its conception, and constitutes an important addition to celestial dynamics. For some years after the publication of Hansen's tables of the moon in 1857 it was generally believed that the theory of that body was at last complete, and that its motion could be predicted as accurately as that of the other heavenly bodies. Newcomb showed that this belief was unfounded, and that as a matter of fact the moon was falling rapidly behind the tabular positions. With the view of examining this question, he undertook the reduction of every observation made before 1750 which appeared to be worthy of confidence. The results of this work were published in 1878. The discussion of the observations made after 1750 was interrupted by his work on the planetary tables carried on during his connection with the *Nautical Almanac* office. After his retirement from active service in the navy he was enabled, due to a grant from the Carnegie Institution of Washington, to secure the necessary assistance from 1903 to 1909 to bring to completion the work of his great programme on the motion of the moon. This was finished less than a month before his death. The observations used in his work covered an extreme range in time of about 2,600 years and seemed, as he himself said, "to prove beyond serious doubt the actuality of the large unexplained fluctuations in the moon's mean motion."

On taking charge of the 26in. equatorial at the United States Naval Observatory, Newcomb devoted it almost exclusively for the first two years to observations of the satellites of Uranus and Neptune. The results of these skilfully conducted observations were published in a memoir on *The Uranian and Neptunian Systems*.

As early as 1860 Newcomb communicated an important memoir to the American Academy, *On the Secular Variations and Mutual Relation of the Orbits of the Asteroids*, in which he discussed the two principal hypotheses to account for the origin of these bodies—one, that they are the shattered fragments of a single planet (Olbers's hypothesis), the other, that they have been formed by the breaking up of a revolving ring of nebulous matter.

In the *Astronomical Papers of the American Ephemeris* will be found a large number of contributions from Newcomb's pen on some fundamental and most important questions of astronomy. Among these are papers on *The Recurrence of Solar Eclipses*, *A Transformation of Hansen's Lunar Theory*, *Development of the Perturbative Function and its Derivatives*. His memoir *On the Motion of Hyperion, a New Case in Celestial Mechanics*, is in some respects one of his most original researches. He discussed the transits of Venus of 1761 and 1769, and those of Mercury from 1677 to 1881. At the international conference, which met at Paris in 1896 for the purpose of elaborating a common system of constants and fundamental stars to be employed in the various national ephemerides, Newcomb took a leading part, and at its suggestion undertook the task of determining a definite value of the constant of precession, and of compiling a new catalogue of standard stars. The results of these investigations were published in 1899, and were in general use for a quarter of a century. In the intervals of these immense labours, on which his reputation as an astronomer rests, he found leisure for works of a lighter character; e.g., his *Popular Astronomy* (1878), his *Astronomy for Schools and Colleges* (1880), written in conjunction with E. S. Holden, and *Astronomy for Everybody* (1903). After his retirement from official life he published an excellent popular treatise on *The Stars* (1901). Several of these books have been translated into one or more of seven different foreign languages. A more recondite work is his *Compendium of Spherical Astronomy* (1906). He also wrote on questions of finance and economics, as well as in the field of fiction.

He received honorary degrees from ten European and seven American universities. He was a member of 45 foreign societies. He was awarded the gold medal of the Royal Astronomical Society in 1874, the Huyghens gold medal of the Holland Society of Science in 1878, the Copley medal of the Royal Society in 1890, the Bruce gold medal of the Astronomical Society of the Pacific in 1897, the Schubert prize of the Imperial Academy of Sciences, St. Petersburg, in 1897, and the Sylvester prize of Johns Hopkins university in 1901. He died at Washington on July 11, 1909, and was given a military funeral befitting his rank as a rear admiral in the United States Navy.

An autobiography, *Reminiscences of an Astronomer*, appeared in 1903; and a bibliography of his life and works containing 541 titles, is given by R. C. Archibald in *Memoirs of the National Academy of Sciences*, xvii., "First Memoir," pp. 19-69. This also contains, pp. 1-18, "Biographical Memoir" by W. W. Campbell. (W. S. E.)

NEWCOMEN, THOMAS (1663-1729), English engineer, one of the inventors of the steam-engine, was born at Dartmouth. While employed as ironmonger in his native town, he corresponded with Robert Hooke about the possibility of obtaining motive power by exhausting the air from a cylinder provided with a piston, Denis Papin and the marquis of Worcester having already made investigations on this subject. In 1698 he entered into partnership with Thomas Savery (c. 1650-1715), who had patented a method for raising water from mines. Newcomen's improvements on Savery's invention were so successful that they produced together a pumping-engine which served as a model for nearly three-quarters of a century. For a description of the "atmospheric steam-engine," then known as a "fire-engine," which they constructed in 1705, see STEAM-ENGINE. John Cawley (or Calley), was also associated with them in this invention. Newcomen died in 1729, probably in London.

NEWDIGATE, SIR ROGER (1719-1806), English antiquary, was born on May 30, 1719. He was the 5th baronet of Harefield (in Middlesex) and Arbury (in Warwickshire), and grandson of Sir Richard Newdigate, an English chief justice during the time of Richard Cromwell's protectorate. He had an active political career, but is chiefly remembered for his collection of antiquities including marbles, casts of statues and vases. Two marble candelabra found in Hadrian's villa at Rome he purchased for £1,800 and presented them to the Radcliffe Library at Oxford. Among his other generousities to the university were a chimney piece, for the hall of University College, and the sum of £2,000 for the removal by Flaxman of the Arundel collection of marbles to the Radcliffe Library. The "Newdigate" prize of twenty-one guineas for English verse, which is open for competition each year to the undergraduates of Oxford University, was founded by him and was first awarded in the year of his death. He died at Arbury on Nov. 23, 1806.

NEWEL, in architecture, originally the central shaft around which a spiral or semi-circular staircase winds. Now more commonly any post at the intersection of a stair with a landing, in which case it is a vertical post which receives the rail and is framed into the supporting strings or beams of the stair construction. By extension, the term is also applied to any post in the railing larger than the other posts or balusters.

NEW ENGLAND. That portion of the eastern coast of North America lying between the 41st and 45th degrees of North Latitude received its name of New England in 1614 from Capt. John Smith who explored those shores on behalf of the Virginia Company of English merchants.

Physiographically, New England possesses great variety and also a unity derived from isolation. Such physical isolation and unity is, however, deceptive, for New England faces on three fronts. The long and deeply indented coast line from its easternmost point on the Bay of Fundy to the tip of Cape Cod, turns New England toward the maritime provinces of Canada, toward the fishing grounds of the Newfoundland banks and toward the ports of northern Europe from which it is some hundreds of miles less distant than are its rival ports in the middle States. New England's southern shore from Cape Cod to the Hudson river

invites close relations with the States to the south, that part lying west of the Connecticut river, especially falling within the area of the metropolitan influence of New York rather than any New England centre. The north-western region, on the other hand, turns its back on the rest of New England and finds its outside connection through Lake Champlain and the Richelieu river or through Lake Memphramagog with the Canadian province of Quebec.

The very characteristics of location, climate, topography and soil conditions and lack of natural products of a highly prized

PULPIT ROCK AT NAHANT, MASSACHUSETTS

sort, which discouraged the exploitation of New England in the early years of American colonial development, were admirably calculated to make it an attractive seat for political and religious refugees whose primary consideration was living conditions and freedom from external molestation. While substantial financial resources assured the success of the Puritan colony of the Massachusetts Bay company, the survival of the feeble and ill-supported settlement of the Pilgrims at Plymouth proved that a living could be won from the wilderness by extraordinary effort and self-discipline. Both examples prompted other undertakings. Roger Williams, Ann Hutchinson and Wheelwright, refugees from the strict theocratic government of Boston, with no backing from the home government, set up tiny political States at spots just beyond the boundaries set by the Crown to the jurisdiction of Massachusetts Bay Company. On the other hand, new immigrant groups enlarged by malcontents from Massachusetts established strong settlements on the southern coast and secured royal recognition as the colony of Connecticut in 1661. In four directions colonial attempts of a distinctly different type were attempted. Based on Champlain's discovery in 1609 of the lake which bears his name, the French Government in Canada attempted to establish *seigneuries* on the slopes of the Green mountains bordering that lake. On the coast of Maine, Sieur de Mont in 1604 and a band of Jesuits in 1613 tried to found colonies. North of the Merrimac river Capt. John Mason received a grant from the Crown and sent settlers to the mouth of the Piscataqua (Portsmouth). His plans for an aristocratic domain modelled on the mediaeval County Palatine as well as his appointment as royal governor-general of all New England came to naught with his death in 1637. His settlers fell under the rule of the Massachusetts Bay company until created into a royal province in 1679. Further north-east another royal proprietor, Gorges, planned to colonize but failed in competition with the Puritan settlers. His heirs sold their claims to Massachusetts in 1674 and the region under the name of the District of Maine remained a part of Massachusetts until erected into an independent State in 1820.

The New England colonies had attracted little attention from the restored Stuarts until complaints of the independent attitude of the Massachusetts authorities in the persecution and exclusion of Quakers and Anglicans and a disregard of the Navigation acts drew down the royal displeasure. James II. attempted to systematize his northern colonies by consolidating all the New England

colonies with New York and New Jersey under a single royal governor. From an administrative point of view the scheme was sound. This new "Dominion of New England" would also have enabled the English to oppose the threatened aggressions of the French more effectively, but the methods of James's agent, Randolph, and his governor, Andros, roused bitter opposition in New England. The cancellation of their charters the colonists regarded as a destruction of their constitutional rights. When the news of the glorious revolution in England reached Boston, Andros was overthrown, Connecticut and Rhode Island quietly resumed their old charter governments and Massachusetts obtained at the court of the new sovereigns, William and Mary, a restoration of many of her old rights under a new "province" charter (1691). The qualities and characteristics which have distinguished the New Englanders and the institutions which New England has given to America were developed in the colonial period. At first, the most pronounced characteristic was the capacity for co-operative action. From this sprang the public school system, the town government, the Congregational Church organization. By the Revolution, however, the individualism which appeared sporadically in the early years came to be general and reached its height in the political philosophy of the Adamsses, in the transcendentalism of Emerson, in the educational theories of Charles William Eliot. Much has been said of the spiritual heritage of the Puritans and Pilgrims, and ideals with which they came to New England; there seems to be ample grounds for explaining the peculiar features of New England life with reference to the economic situation. Unquestionably the New England colonists suffered from lack of division of labour. The nature of the soil, the lack of easily accessible markets, the difficulty of securing a surplus of any great staple to exchange for other necessities forced each family to provide for its own wants. This produced a people of singular ingenuity and resourcefulness but without specialized skills. It offered no premium for systematic development of agriculture or industries except the few in which New England had a natural advantage both in production and in marketing. Of these the greatest was ship-building. This industry began almost at once with Winthrop's "Blessing of the Bay" launched on the Mystic river in 1631. On nearly every navigable stream in close proximity to the supply of timber arose small ship-yards where the neighbouring farmers, trappers or fishermen employed their time in off-seasons in turning out vessels for which they found a ready sale, because the English Navigation acts admitted colonial-built vessels to the status of English ships in the monopoly of the carrying trade of the expanding empire.

As compared to the other English colonies in North America, however, New England colonies were not keeping pace either in the matter of supplying the mother country with the desired staples or in offering an outlet for population. The so-called Great Puritan Exodus of the years 1629-1640 has been shown by recent historians to have been directed more to the West Indies than to New England. The strength of New England relative to other sections of the continental colonies fell from 52% in 1650 to 25% in 1790. The beginning of this relative decline was already manifest in 1700. During the Restoration period the Puritan emigration, dormant during the Civil War, revived slightly but was never again the chief source of immigration to America. Of the great streams of migration of the next century, the Scotch-Irish and the Palatinate Germans, New England got but a small share as compared to the Middle or even the Southern colonies. The New England colonies had been singularly free during their early years from interference by the natives on account of a severe plague which had swept away approximately half of the population just before the arrival of the first settlers. In addition to this the authorities had been fortunate in maintaining friendly relations while extinguishing Indian titles to lands allotted to new townships. The war with the Pequots (1637) was the exception.

The French and the Indian wars ultimately benefited New England by the entire removal of the menace to expansion toward the Canadian border, but they were even more important as an effective, though costly training of the colonists in self-government in war time. The colonial legislatures were obliged to raise and

equip troops and supply ships and sailors to convey them on expeditions. Of these the most noteworthy were those against Quebec and Louisburg. The obvious advantage here of joint action brought home again the need of some form of political co-operation such as had been tried in the New England Confederation (1643). New Englanders were, therefore, interested in Franklin's so-called "Albany Plan" of union in 1754.

New England played her chief part in the Revolution during the years 1765-77 in defining the issues and in precipitating actual hostilities. Though these centred in Boston, sentiment for and against rebellion and independence was fairly evenly distributed throughout New England, the line of cleavage being one of class and occupation rather than of locality. After the British evacuated Boston on March 17, 1776, New England saw little of active hostilities, except for the part played by her militia in checking Burgoyne's advance at Bennington, Vt., and in the struggles over the possession of Newport, R.I. Her irreconcilable temper convinced the British that attempts at conciliation or subjugation had greater chance of success elsewhere.

The period of disorganization which followed the cessation of hostilities brought great suffering to many communities and certain classes in New England. The utter disruption of the old courses of commerce within the British Empire no longer supplemented by privateering and war-time trade with other countries caused a lack of specie. Every State fell a prey to a greater or less degree to the paper money craze. Rhode Island, in particular, suffered so heavily that civil war threatened. The refusal of the Massachusetts legislature to relieve the pressure of debts and taxes by stay laws and further issues of paper money, led to a rebellion under the leadership of Daniel Shays. Although the mercantile classes were convinced of the necessity of forming a stronger central government capable of securing favorable commercial treaties with foreign countries, and although New England leaders played prominent parts in the Federal Convention, the actual ratification of the new constitution proved a difficult matter in Massachusetts and in New Hampshire and was rejected in Rhode Island until 1790.

For nearly a decade after the inauguration of the new government under Washington the superior organization of the dominant commercial interests committed New England as a whole to the Federalist party, but Jefferson gradually organized the latent anti-Federalist and Democratic elements until in the election of 1800 he was able to carry several representative districts.

The basis of New England's prosperity in the Federalist period seems to lie in the application of Yankee energy and resourcefulness to the exploitation of the peculiar advantages of New England in foreign trade. Her ships, restricted in their enterprises in the older fields under control of the British Crown, turned to the Mediterranean, Pacific and Indian oceans. In 1786 Samuel Shaw established in Canton the first American mercantile house in China. In 1787 the "Grand Turk" brought to Salem the first of the many oriental cargoes which made that port famous. In 1792 Capt. Gray's "Columbia" carried the Stars and Stripes around the world for the first time and laid the foundations not only for the American claim to Oregon but also the very profitable trade with the north-west coast where furs were obtained which could be exchanged in China for silks and tea. Salem became for a time the tea market of America and Europe and the third city in the Union. The heyday of New England's mercantile success, was shared to a considerable extent by all classes. There was speculation in timber-lands and a rapid shift of population into the frontier States—Maine, New Hampshire, Vermont, western New York and Ohio. The Napoleonic wars shattered this prosperity. Although equipped to compensate the loss inflicted on her commerce by English and French war time restriction through the enormous profits made in privateering and in blockade running, the New England shipper could not survive the devastating effect of the Republican embargo policy. The war of 1812 was regarded in New England as Mr. Madison's war, forced upon him by the *Warhawks* of the West and was viewed as another and convincing demonstration that the annexation of Louisiana and the development of the Western States was ruinous

to the interests of the old commercial States of the north-east and justified that group in seceding from a Union in which they would clearly form a hopeless minority. Convinced of the injustice done to their section, New Englanders disregarded the embargoes, carried on illicit trade with the English in Canada and West Indian ports, discouraged recruiting and subscriptions to war loans and refused to celebrate victories gained by the French over the common enemy, the British.

In one respect only did New England enter the war. She supplied men and ships to the navy and was especially active in fitting out privateers. A threatened secession movement in 1804 was headed off by the wiser Federalist leaders like George Cabot and Hamilton, but by 1814 the sentiment had got beyond the control of the moderates and resulted in the convention at Hartford, which demanded an amendment of the Constitution to protect New England interests. The termination of the war left this movement high and dry; it brought its sponsors—the Federalist Party and New England generally—into disrepute among the nationally-minded rising generation of statesmen from the South and West. The interference with her commerce wrought by the embargo together with the interruption of the usual flow of manufactured merchandise from England and the Continent caused some New England capitalists to transfer their money from shipping to the new textile plants which had been introduced during the last decade of the 18th century. At Beverly and Waltham in Massachusetts, at Pawtucket and Woonsocket in Rhode Island, the new spinning and weaving machines had been set up. Saved by the war from immediate competition of English textiles these factories gained a start. The termination of the war saw a great importation of English goods. Faced with ruin, the mill owners of New England joined with the infant woollen manufacturers of Pennsylvania to secure a protective tariff in 1816. As part of a general burst of nationalism the policy of protection and creation of a home market as advocated in Hamilton's famous report on manufactures was adopted. Increased rates were sought after the depression of 1819 and by 1824 New England politicians of all parties were faced by the presence of a new sectional issue. Manufacturing as a New England occupation grew steadily through the next generation bringing with it the social, economic and political problems of concentration of population and constant demand for cheap labour and widening markets. In the same period, 1816–50, the rapid expansion of the agricultural regions of the South and West brought into the eastern markets the cheaper cotton as well as the cheaper food-stuffs. The former stimulated more textile activity—the latter drove the less well-situated farmers to abandon their farms.

Several of the shibboleths, such as "Manifest Destiny" which swept the national Government in the first half of the 19th century left New England cold. Her own frontier, the northern and eastern regions of New Hampshire, Vermont and Maine were losing that character. The northern boundary, long subject to dispute even to the extent of an armed clash known as the Aroostook war of 1838, was finally determined by the Webster-Ashburton treaty in 1842. While hostile to Western expansion, and to the policy of cheap public lands which went with it, New England had contributed mightily to people the new areas. Miss Lois K. Mathews's *Expansion of New England* admirably relates the direction, quantity and peculiar quality of the migration from the New England States. Through this transplantation of her population to the new States of the old North-west and later to Iowa, Kansas and Oregon, New England continued to exert the peculiar influence of her Puritan traditions. In the great problem which confronted the inhabitants of the great areas of the Mississippi valley and the Western plains—transportation—New England took little interest until railroad building came into the class of capitalistic enterprises. Her location excluded her from the competition in canal, highway and railroad building which engrossed the attention of Virginia, Maryland, Pennsylvania and New York. Yet New England had locally been a pioneer in railroad experimentation. One of the first railroads in America was built in 1826 to carry granite blocks from the Quincy quarries to tide water. In the '40s short lines were built connecting Boston with

Providence, Lowell, Portsmouth, Worcester, Springfield, New Haven and New York. In 1850 Massachusetts ranked third to New York and Pennsylvania in railroad mileage.

The humanitarian movements of the '30s produced lively response in New England. Not only were the social problems incident to concentration of population in her mill-towns provoca-

AFTER A PAINTING BY W. A. WALL

tive of controversy over questions such as the length of a working day and conditions of labour, the right to strike and the association of workers, but the assembling of people within easy reach of such potent agencies for education and enlightenment as schools, colleges and lyceum lectures, had a stimulating effect on the popular interest in all sorts of questions. In this soil flourished many new ideas—advocates of liberal movements in religion, like William Ellery Channing, Theodore Parker and Horace Bushnell, crusaders for temperance like Neil Dow, who in Maine secured the first prohibition law in the United States, or for abolition of slavery like William Lloyd Garrison, for public high schools like Horace Mann; the Concord group—Ralph Waldo Emerson, Henry D. Thoreau, Bronson Alcott and Margaret Fuller gave New England an international reputation for "transcendental philosophy"—and with Longfellow, Holmes and Lowell made this section the literary centre of America. The colleges and the academies that had survived the Revolution largely as sectarian institutions or theological schools now took on more liberal aims and methods and sent their graduates all over the country. At Litchfield, Conn., the first real law school in America flourished, under the guidance of Chancellor Kent, and produced such men as John C. Calhoun. Harvard college, where the triumph of liberalism over the more orthodox Puritan Party in Boston in the early 18th century had led to the founding of Yale by conservatives, carried its liberalism still further and in the 19th century, under the guidance of Unitarians, borrowed largely from the German universities, gradually widened its curriculum on an elective basis, developed graduate schools of law, medicine, arts and science. In Providence the Baptists had founded Brown; at Middletown, Conn., the Methodists established Wesleyan; in the Connecticut valley arose Amherst; in the Berkshires Williams college, and in Maine appeared Bowdoin, Bates, and Colby. In Vermont a State university was established through the benevolence of Ira Allen.

The position of New England in the Civil War accords with the double character of that struggle—the abolition of slavery and the preservation of the Union. The same men who gave their lives for the latter issue had heaped abuse upon the men like Garrison who had agitated for 20 years in favour of the former issue. On the other hand, Wendell Phillips had denounced the clergy and the Cotton Whigs for their willingness to compromise with the slave owners, and a great convention at Worcester advocated New England's secession from a Union which required its members to enforce the Fugitive Slave law and to recognize slaveholders' property rights in human flesh. Once war began, New Englanders supported the Administration steadfastly although the persistent demands of Charles Sumner and other abolitionists for immediate emancipation frequently caused embarrassment to

President Lincoln. During the Reconstruction period New England remained consistently Republican.

New England commerce suffered severely during the Civil War. The whaling fleet, once the pride of New Bedford and Nantucket, was broken up by Confederate raiders and its monopoly of the illuminating oil market was destroyed by introduction of kerosene oil, gas and electricity. By the change from wooden to iron, and then to steel ships, and by the rising costs of operation under the American flag, all the natural advantages in the construction and operation of ships which New England formerly possessed, were lost.

Again as in 1812, New England's answer has been to shift her capital from shipping to manufacturing. Again as in the '30s and '40s she succeeded, but toward the close of the century was faced with competition from new centres in the South and West, equally well equipped with power sites, with capital and within easier reach of the source of raw products and of the markets.

New England is now a highly industrialized section, yet she retains a good deal of the diversification of occupation which gave the Yankee his reputation for being a jack-of-all-trades and has produced many inventors.

Apart from the decline in her relative position in commerce, the chief respect in which New England has altered in comparison with other sections of the Union has been in the character of her population. Far from being the most homogeneous section of the colonies, New England has become one of the most cosmopolitan areas. The development of industries on a factory basis was effected by drawing the "native" New England stock from farms to factories without reliance on the recent immigrants. It was not till after 1830 that the number of non-English immigrants began seriously to affect her political or social structure. The great immigration of Irish after the famine in the '40s produced in the neighbourhood of Boston some serious disturbances, and New England shared the anti-foreign sentiment which took political shape in the Know-Nothing party. The immigration of large groups of other nationalities and religions between 1890 and 1914 altered the situation rapidly. Although the number of native-born of English ancestry still forms a minority in New England as a whole, and is almost negligible in the industrial centres, the *blochs* of foreign-born or those of non-English ancestry tend largely to offset each other for political and social or economic purposes. Of the "foreigners" the Irish Catholics took the most active part in politics. Except for a short period in 1912 during strikes in the textile centres, the influence of radical leaders has been slight among the working classes. Trade unionism existing in most industries is generally directed in conformity to the conservative policy of the American Federation of Labor. That there has been no general attack on the principles of capitalism is due to the fact that the New England States have been leaders in legislation favourable to labour as respects conditions and hours of work.

New England won the name of the Switzerland of America because of the independent spirit of her people in the colonial and revolutionary periods. She has kept the title in virtue of her natural scenery, stimulating climate and the wisdom of her people in conserving her natural attractions for a vacation resort and playground. No other of the old sections of the Union has set aside so many beautiful areas for parks or reservations. The White mountains of New Hampshire, the Green mountains of Vermont, the lake regions and rugged coast of Maine, the wooded Berkshire hills and sandy stretches of Cape Cod have become nationally famous. They attract a visiting population of summer residents, tourists and children's summer camp colonies which doubles the normal population of many regions during every summer. Of late years a similar movement to enjoy winter sports in the northern States has been inaugurated. From colonial days down to the present, a constant emigration of New England born or trained leaders in literature, art, science and engineering has extended her influence in the nation out of all proportion to her population or her area or to the capitalization of the industries situated within her borders.

(P. P. C.)

NEW FOREST, one of the few woodland regions left in England, covering 92,365 acres in the south-west of Hampshire,

between the Solent, Southampton Water and the river Avon. The Crown has the right to keep enclosed and planted 16,000 acres.

The New Forest is one of the five forests mentioned in Domesday. It was a hunting-ground of the West Saxon kings, but derives its name from the afforestation schemes carried out by William I. in 1079. One of the chief sources of the wealth of the forest in early times was the herds of pigs fed there. The New Forest being under the forest laws, was affected by the forest clauses of Magna Carta and by the Forest Charter (1217), which mitigated their severity. The chief officer was the justice in eyre who held the justice seat, the highest forest court. The lower courts were the Swainmote and Wodemote, the former of which is still held, in a modified form, in the Verderers' Hall of the King's House at Lyndhurst. The circuit of the justices in eyre, or their deputies, continued down to 1635; they were virtually ended by the Act for the Limitation of Forests (1640), though Charles II. attempted to revive them, and they were not legally abolished until 1817. The lower officers of the forest, who held merely local appointments, were the verderers, the regarers, the foresters, the woodwards and the agisters. There was also a lord warden, who was usually a nobleman and performed no judicial functions. The Deer Removal Act (1851) resulted in the almost total extinction of the forest deer. Under the act of 1877 the forest is administered as a national park. About one-fourth of the area is under cultivation by private owners and tenants, and the remainder is open woodland, bog and heath. The principal village within the forest is Lyndhurst (pop. [1921], 2,562), with the verderers' court, in charge of the Crown portion of the forest. On the western outskirts lies the town of Ringwood (*q.v.*). Beaulieu village on the estuary of the Beaulieu river, has ruins of Beaulieu Abbey, founded by King John for Cistercians. The gatehouse is restored as a residence, and the Early English refectory as a church. There are considerable remains of the cloisters, chapter house and domestic buildings.

NEWFOUNDLAND. Newfoundland is said to be the tenth largest island in the world, forming a separate country. It is one-sixth larger than Ireland, one-fifth smaller than England. It is approximately 317 m. in its widest place, and 317 m. long from north to south. Its area is 42,734 sq.m. Pop. (1925) 258,425. It is a country of great potential wealth.

Material wealth has been more easily and rapidly accumulated farther west, and the current of immigration from Europe has hurried past her shores only staying to profit by her more easily gathered raw products. New methods of using the resources of nature, new methods of controlling her powers, new methods of transportation and communication are beginning already to turn new attention to this oldest colony of the greatest empire in the world.

Position.—Newfoundland lies more to the south than England, and her position at the gateway of the St. Lawrence has given her a strategic position that is alone sufficient to raise her to a position of first importance to the federated nations of the British Empire, while the fact that her capital lies almost exactly half-way between New York and London made her the link that enabled the two great English-speaking countries to be first united together by the message-carrying transatlantic cables, decades before it would have been possible in any other way. Nor as a pioneer in uniting the two countries through the conquest of the air has Newfoundland played a mean part.

Newfoundland is part of the American continent, broken off. Her southern point, Cape Race, lies as far south as 46° 39' N. in the latitude of Bordeaux, France, and her northern point, Cape Norman, is in 51° 38' N., the same as that of Brighton on the English south coast, while she falls in longitude between 52° 36' W., and 59° 30' W. She is separated on the north from Labrador by the Strait of Belle Isle, fifty miles long, which ranges from nine miles wide at its narrowest place at the western end to forty miles wide at its eastern entrance. This is a shallow, mostly sandy bottomed strait, through which the ocean current, coming from the Polar sea runs into the Gulf of St. Lawrence, and through which the great river of Canada, as it now is called, partly dis-

charges her waters (the rest flowing through Cabot Strait, a piece of water ninety miles wide at its narrowest place, between Cape Breton on the Canadian side, and Port au Basques, opposite it in Newfoundland). Belle Isle, or the Isle of Demons, lies in the centre of the eastern entrance. Its lofty cliffs are well lighted at both ends by fine lighthouses, and it is one of the best cod fishing stations in the world.

Minerals.—The story of mines in Newfoundland is very different in 1928 from what it was in 1925. Then, excluding the great Wabana iron deposit at Belle Isle in Conception Bay, minerals gave little return to the country. In 1928, with the lead, zinc and copper of Buchan's mine on the Exploits, and the Red Indian Lake deposit, the new day had dawned. The huge deposit of titaniferous magnetite at St. George's, called Steel Mountain, the widely distributed deposits of copper in Notre Dame Bay, now that low grade ores can be so much more profitably worked, the silver lead zinc area of Placentia Bay, especially the La Manche lead mine, the vast deposits of coal in St. George's neighbourhood, all promise a real future in this third line of native wealth. As a copper producing country, experts say that the future is absolutely assured. Gypsum for cement, fine slate, oil shale, and the annual output of oil on the north-west coast, need further work, but again the experts estimate them as a potential of great value. The final settlement of the "Labrador Question" by the Privy Council in 1927 entirely in favour of Newfoundland, has given the Colony an area twice as large as her own, with waterfalls that are, for potential power, now unequalled in the world, and all the timber, minerals, fisheries and wealth of one hundred thousand square miles of virgin territory. Its value to her is estimated at anywhere between \$300,000,000 and \$500,000,000 on a conservative estimate. Yet a few years ago, she offered the whole of it to Canada for \$30,000,000, and the offer was declined.

Physical Character.—The coast of Newfoundland is rugged and rocky, and deep water runs right up to the cliffs. These rise high and perpendicular in most places, but beautiful bays intersect this outer face, and wind away mile after mile, in many cases among numerous islands, giving a coast line of over four thousand miles. Conception Bay, Trinity Bay, Bonavista Bay, St. Mary's Bay, Placentia Bay, Green Bay, White Bay, and Bay of Islands are the chief large inlets, and through them find outlet to the sea beautiful winding rivers of which the Gander, the Humber, and the Exploits are the largest, the latter being a mile across at its mouth. There are innumerable lakes, some many miles in length. Grand Lake and Red Indian Lake being among the largest, with areas of one hundred and ninety-two square miles, and sixty-four square miles respectively. The bottom of Grand Lake is three hundred feet below sea level. One-third of the surface of the Island is said to be water-covered. These lakes fill the deep gulches between rocky mountains, are very deep and mostly well stocked with trout. The highest and most beautiful mountains are on the north-west coast. They extend north from Cape Ray about 200 m., and rise to over 2,200 ft.; as they rise almost directly from the water line they have a very impressive effect on the passer-by. The "tundra" nature of the land near the Coast affords excellent pasture for caribou. The half dozen moose imported by the Government have multiplied steadily.

Climate.—The total annual rainfall of Newfoundland is not large. Its sunshine is above the average. The heavy fogs, even of the south, seldom surmount the immediate ramparts of her shore line, while farther north, as the Gulf Current gets farther and farther from the land, except in the Straits of Belle Isle, where the warmer waters of the Gulf of St. Lawrence meet the cold incoming tides from the Polar Current, the fogs, so far as navigation goes, are not a more serious factor than elsewhere. The climate is somewhat that of England, except that it is colder, and possibly a little damper, except in the North, where the narrow peninsula is completely sub-Arctic, being steeped on both sides in the Arctic waters.

Population.—Of the original inhabitants, a sturdy, brown race of peaceful and clever little people, called Beothucks, perhaps the less said, the better. They were wilfully destroyed, being hunted down like wild animals.

Newfoundlanders are open air men. They do not take kindly to mining, or even to the lumber woods. On the other hand, they are born mechanics, and as carpenters, builders, plumbers, painters and skilled workmen of all kinds, they are greatly in demand—so much so that it is truly said that there are more Newfoundlanders in Boston today where a "Newfoundland Gazette" is regularly published for their benefit than there are in St. John's. Once, however, her mineral wealth is seriously tapped, and her pulp and other potentials scientifically exploited and conserved, the population will probably increase.

The population of St. John's, like many other things, is recorded only according to religious affiliation, and there are said to be, in 1927:—8,374 Church of England, 7,623 Methodists, 980 Salvationists, 1,047 Presbyterians, 348 Congregationalists, 326 other denominations; that is, 18,698 Protestants, and 17,746 Roman Catholics, almost entirely of Irish extraction.

In the whole Colony:—The church of England numbers 84,665, Methodists 74,205, Salvationists 13,023, Presbyterians 1,876, Congregationalists 1,018, Other Denominations 1,670. Total Protestants 176,457. Roman Catholics 86,576. There is an archbishop of the Roman Catholic Church, and two bishops, and one bishop of the Anglican Church.

Education.—The people of Newfoundland are of English stock largely from England's western seaports, while mixed with these are the inevitable Scots, and not a few Irish. Only a few French remain. Comparatively, they are a poor people, and at times in outposts there is considerable shortage of the necessities of life, as the deficiency diseases only too forcibly testify, and even still there is, in the outposts, a great deal of illiteracy. For if the political system can be classed as successful, the denominational system of education has little, if anything, to recommend it, so far as results go, and overlapping sectarian schools paid for by the Government are one of the greatest handicaps of the Colony. One or two interdenominational schools have been founded by outsiders, under Government permission. In the capital itself, good schools exist, but Newfoundland has no university of its own, and its students still go to England, Canada, or the United States for degrees and for higher education.

Economics.—Almost of necessity the Newfoundland fisheries have been carried on a credit basis, since the time when the lower hands on the vessels were treated little better than serfs. But the credit system here has been exceptional in that in so many cases very little money was paid. This led to a peonage system in which the poorer people lived on what supplies their particular merchant cared to give them, and many, even fathers of families, never owned money. On the other hand, merchant and planter (i.e., fisherman with an outfit) in a sense stood together, and as long as the industry repaid generously both capital and labour, there was no lack for either of plenty or happiness. Trouble began when fish became scarce, when prices dropped, and when capital claimed all repayment first, and failed to recognize that labour also was the equivalent of money invested. Thus, in bad seasons, labour always accumulated debts, and no wages being credited for the outlay of all his time, the fishermen often lived and died in debt, and even handed his "red letter" debts on to his children, so much so that a law had to be passed that debts contracted at the cod fishery to one supplier might not be charged by another against any credits he might establish on account of the seal fishery. Of late years, cash has been regularly paid for balances due, and a truck act is in force. To understand the peculiar conditions of the social life of the fishermen of the island, these facts have to be understood. It was in an honest endeavour to remedy the conditions that about 1900 the Fishermen's Protective Union was formed, becoming a co-operative, productive, and distributive society. The members flew their own flags, created a new centre for the collection and sale of the proceeds of their voyages in a new harbour away altogether from the capital, and all around the island, in the outposts where fishermen lived, they established the Fishermen's Union Cash Co-operative stores. The idea spread like wild fire, and if possible to carry it out efficiently, the system is unquestionably ideal, for it really offers the men, whose hard work and dangerous calling produce the wealth, at least a major part of the resulting

profits. At first it went splendidly, though against great opposition, for it, like every reform, tended to upset all the conventions of commerce as well as all the traditions of this particular trade. It had no revolutionary side, it sought peace, not war, in business. But it could only get human agents, and many of them were not equipped fully for their responsibilities. Politics, alas, were also allowed to enter, and played no small part when troubles began. Though the humble founder was honoured by the King, at the request of the Newfoundland Government, with a knighthood, and became the Minister of Fisheries, the success that was merited and anticipated for this most interesting venture has been disappointing, though this Union still functions and has many firm and loyal friends; but the bulk of fishermen do not have the same active connection with it as before.

Fishing.—Newfoundland has exported on an average fifteen million quintals or seventy thousand tons of dried codfish every year at a value of about \$6,000,000 reaching even \$12,000,000. This is only one-third the weight of fish when first caught before being split and dried. There are three fisheries, the Grand Banks, the "Shore" or home coast, and the Labrador. The banks are probably the top of an old submerged mountain range, three hundred miles long, running south-east towards the centre of the Atlantic Ocean, over which 80 up to 100 fathoms of water washes. They are covered with sand and fine mud, and the two currents that meet over them bring endless small diatoms and algae, on which are fattening endless invertebrates of the crustacean and mollusc types, that in turn fatten the hosts of codfish that resort there. The cod swim in to the coast from the deeper water in May and June, heralded by sardine-like fish called caplin, which, in enormous hordes, land on the actual sandy beaches to spawn.

The number of fishermen varies, but approximately one-fifth of the population now engage in catching and curing codfish. About 1,000 schooners are used, the numbers having fallen from over 1,500. The bankers use long lines or trawls with many hundreds of hooks on each. The "Shore" and Labrador men use mostly submerged nets, called traps, which cost about four hundred dollars apiece. They also use hand lines and flaxen gill nets set on the bottom, and ordinary twine mesh nets, called "cod-nets." Squid follow the caplin and on these also the cod feed greedily; they make excellent bait and also are good eating.

In spite of the decline of late years in the number of men and boats employed in the Colony's fisheries, the actual statistics are enlightening:—

<i>Actual quantity of Codfish caught in qtl.</i>	<i>Value in dollars</i>
1885 . . . 1,284,719	4,061,600
1905 . . . 1,196,814	5,108,614
1927 . . . 1,589,841	12,957,414

The advent of the Hudson's Bay Company in 1927 into the codfish trade of Newfoundland is a very happy augury for her.

Exports of cod oil unrefined, 1921, value	\$474,394
Exports of cod oil unrefined, 1928, value	751,734

The new knowledge of the enormous value to the human body of refined cod liver oil, has advanced its price all the world over, exactly as it has that of calf's liver. The Newfoundland cod liver oil has been repeatedly stated by the chemical biological experts of the United States to be the richest in vitamins in the world.

In 1921, 45,956 gallons were exported, valued at . . .	\$ 79,982
In 1926, 169,645 gallons were exported, valued at . . .	197,244

The lobster fishery has been necessarily closed down, owing to the great depletion of that esculent crustacean, and whereas the export value of cases in 1921 was \$304,954, in 1927 it was nothing at all. In the 'eighties, a fine fish and lobster culture laboratory, and fish protection centre, were established at Dildo, in Trinity Bay, under a Norwegian scientific expert. This introduced laws protecting lobsters, and gave out simple floating hatcheries for saving the spawn, and replenishing the stock. But political opposition closed this soon after.

The salmon fishery has at last begun to come to itself. The putting up of salmon in salt or brine never made an article of food that was much appreciated in the market, except in limited quanti-

ties that could be washed out, smoked, and sold chiefly for hors d'oeuvres. In 1926, however, largely due to the enterprise of the Hudson's Bay Company, fresh salmon was satisfactorily put on the London market, in such excellent condition that a company of expert tasters gathered in London for a sample testing at the greatest fish restaurant in the world, were unable to distinguish it from fish just taken from the rivers. This industry is just beginning, and so far the capacity of the Newfoundland salmon fishery has only been touched. With its long coast line, and its innumerable rivers, there is no reason why, if the breeding rivers are themselves adequately protected, the fresh salmon trade of Newfoundland should not compete even with British Columbia in value, for the coast is so close to Montreal, New York, and London, as to throw their large trade almost wholly into her hands. New methods of collecting, catching and preserving, are all the while improving, and there are no salmon in the sea like the crisp fat fish of the Labrador current, all of which are caught in salt water in gill nets, before they enter the rivers, where they would be knocked about, and where they do not feed. In 1920, pickled salmon fetched \$85.563. In 1926, it fetched \$130.825, while fresh salmon fetched in 1926, \$144.896.

The seal fishery varies in value, but already shows that these mammals, which have only one young per year, are unable to stand against the modern inventions used to destroy them when they are helpless at the time of motherhood. The mothers bring forth their young at the end of February or early part of March on the level floe ice, called "whelping ice," that comes south along the east and west coasts of the Colony. They are there attacked by large ice-protected steamers, with wireless communications with the land, and with one another, with airplane service to direct the vessels where possible, and with modern repeating rifles and expanding bullets. There is, moreover, every year great loss from thousands of seals being killed, and their bodies lost upon the ice pans, as it is still legal to kill many more than can be taken straight to the safe storage of the ship, and they are left floating about on the loose ice, with flags indicating the owners, hoping that they may be picked up later. In 1927, only nine steamers, with crews amounting to 1,634 men, pursued this fishery, and brought home 180,459 seals, as against 211,531 taken in 1926, a very large decrease on what used to be taken half a century ago. There are those who defend this fishery, especially the old sealing captains and steamer owners, but the man-in-the-street sees nothing but obliteration for the herds, like those of the hood seals of East Greenland, if this annual slaughter continues. The poor settlers of the Labrador and North Newfoundland coast suffer severely from the diminution of these seals, for they depend on them for both meat and boot leather in the long winter, while the oil was to them an essential winter industry. For 1928 the total value to the Colony of all the fisheries was estimated at \$36,000,000.

Another future for the abundant cod lies in the distribution of it in cold storage; no doubt this will be greatly developed in the future. Hundreds of tons were thus sent to Europe during the war.

Whales.—The whale fishery, which declined and almost disappeared a few years ago, except for the station at Hawk's Harbour in Labrador, has practically been taken over by Norwegians. A very large factory has been opened in Greedy Islands, and the managers propose to put yet another about 200 m. further north. The law only allows two killing steamers to a station. The average number of whales to make such a factory pay well is two to three a day. There is a large patch of ground off the south Labrador coast, greatly frequented by sperm whales, once supposed to be the doyen of the huge cetaceans. In 1927, however, orders were given not to bother with sperms, but to bring in only sulphur bottoms or blue noses, humps or finbacks. The value of sperm oil, and the difficulty of getting it out of the whale made it practically unremunerative.

Finance.—The coinage is decimal. The measures and weights are as in England. The banks are Canadian. When the local banks went into liquidation, the Bank of Montreal, the Royal Bank of Canada, the Bank of Nova Scotia, and the Bank of Commerce at once stepped in, and have ever since rendered yeoman

service. American, Canadian or Newfoundland Government notes are all accepted in the Colony, and there is no demur or worrying even over accepting silver or gold coins of all those countries in Newfoundland. The catholicity of a seafaring people happily pervades all their activities. All the Government finances, even their savings banks' business, is done through the great Bank of Montreal. The economic disadvantage to the country of this is apparent, where the power of every dollar is so much needed locally. The habit of saving in actual gold by fishermen became almost universal after failures of Newfoundland banks in 1895. Deposits in all the banks have increased considerably. The figures are:—

	1922	1926
	\$	\$
Bank of Montreal	6,034,863	8,158,286
Bank of Commerce	701,760	990,066
Royal Bank	3,766,933	4,079,537
Bank of Nova Scotia	7,676,776	8,664,601
Government Savings Bank	1,984,542	2,011,262

The trade, revenue, expenditure, loans and public debt statistics, are equally illuminating:—

	Imports	Exports	Current revenue	Current expenditure	Funded pub. debt
1910	3,527,126	3,354,746	27,176,380
1917-18	26,892,946	30,153,217	6,540,083	5,369,455	34,480,955
1926-27	25,813,871	30,839,859	8,932,436	10,533,409	72,017,932

There are approximately five million dollars in loans and in a sinking fund, reducing the liabilities of the public debt to approximately sixty-seven and a half million dollars. This makes the public debt per caput of the population about \$260, half of which was due to the World War. This is double that of any provinces of the Dominion of Canada. The steady borrowing of money is easy, and still goes on, and almost every year a new loan is contracted. It is, however, hoped that the new industries now developing may make this unnecessary.

Public Debt.—At the end of the nineteenth century, the public debt of the Colony was small, approximately \$9,000,000, and her population about 250,000. But Newfoundland, which has been described, not altogether unjustly, as a land of a repetition of misfortunes, was suffering from a fresh series of disasters. In 1892, for the third time, the capital of the country, St. John's, was wiped out by fire, and in 1895 all the banks in the country failed, and many people all over the island lost the savings of their lifetimes. This, capped by some bad fisheries, had greatly discouraged even the politicians in St. John's, and overtures were made to Canada to enter the federation on condition that their public debt be taken over by the Dominion. Sir Mackenzie Bowell, however, Prime Minister of Canada at that period, with his Cabinet, decided that the price was too great, a decision which many Canadians have bitterly criticized in later years. Since that time, Newfoundland's public debt has doubled several times, and stands in 1928, at some \$67,500,000, with still only a population of 260,000. This has involved heavy taxation, and a greatly increased cost of living. Unfortunately, concurrent with this increase there has been a decrease in the value of Newfoundland's main production, salt cod-fish, and consequently a gradual decline in the number of vessels and men employed. Whereas, 90% of the people were once living out of the fisheries, less than 50% now are able to do so, though the greatly increased level of living partly accounts for this. The great war undoubtedly had much to do with this, but however that may be, even with the new labour opportunities that have arisen to supplement the incomes derivable from the season of open water, the fishery no longer supports the country, and a very large number of her yeoman families have left for the United States and Canada.

The details of the revenue for the year help to an understanding of the country's problems, and are as follows, for the current year 1927:—

Income		Expenditure	
	\$		\$
Customs	7,321,512	Int. on pub. debt	3,538,785
Posts	354,676	Civil government	540,311
Telegraphs	170,040	Civil pensions	89,426
Crown lands	107,602	Military pensions	618,835
Int. revenue stamps	48,762	Old age pensions	114,425
Fines	4,613	Admins. of justice	481,008
Interest on loans	87,155	Legislation	93,678
Brooms from penitentiary	2,893	Education	914,958
Fees of pub. institutions	43,512	Pub. charities	1,135,752
Taxes and assts.	140,183	Ag. and mines	79,659
Estate duties	89,803	Marine and fish.	408,272
Liquor sales	350,000	Roads and bud-gets	458,541
Bus. profits, tax on cars	61,364	Customs	628,220
Income tax arrears	34,391	Posts and tel.	1,142,949
Man. sales arrears	691	Elections	21,977
Misc.	115,132	Audit	180,327
	8,932,329		10,533,458

Trade.—Newfoundland imports much she might well produce, much land for cattle being undeveloped, and unused, and thousands more pigs might well be raised, than are at present. Duroc Jerseys and Berkshires flourish well in the North, and the pigs fatten well on codheads, berries, roots and offal. Coal exists in good quality and great plenty and might well be exported. Hay can be grown of perfectly satisfactory quality in unlimited quantities in return for labour. Hides should be exported instead of imported. Eggs also can be raised in abundance. It is true, bacon and eggs, and everything fed on fish foods are apt to taste fishy, but clean feeding for a while before slaughtering, and good cooking do much, and it is better to have quantity of essential food constituents than to haggle over flavours.

In 1926-27, Newfoundland imported: beef, salted, 46,879 barrels, valued at \$851,681; butter, 612,195 lb., valued at \$219,884; coal, 334,034 tons, valued at \$1,745,451; flour, 368,240 barrels, at \$2,927,236; cotton, wool, silk and clothing, \$3,036,192; leather in 1924, \$623,554, 1925 \$492,901, 1926 \$280,162; hardware in 1924, \$936,517, 1925 \$1,461,283, 1926 \$1,014,532; molasses, in gallons, in 1924, \$686,368, 1925 \$572,534, 1926 \$589,889; sugar, in cwt., 1924, \$135,509, 1925 \$139,926, 1926 \$130,752; pork, 1926, 23,990 barrels, valued at \$626,876; salt, tons, 1924 61,968, 1925 61,668, 1926 50,319; tea, 1926, 1,492,699 lb., valued at \$562,811; tobacco, 1926, 675,403 lb., valued at \$263,463.

In 1917 Prohibition became law in Newfoundland by 24,950 votes against 5,362, but was annulled by the Government in 1924.

Since that year imports of wines and spirits were:—

In 1924-25, 68,354 gallons at a cost of \$123,761.

In 1925-26, 102,311 gallons at a cost of \$175,627.

In 1926-27, 203,028 gallons at a cost of \$719,903.

—a very rapid increase, but it is claimed by the anti-prohibitionists "with excellent results to both revenue and morality." These figures do not include beer, nor is the making of home brew, which is cheaper, and in a poor country therefore still certain to be manufactured in the outports as before, any more specially guarded against. The present law prohibits a great many things which those interested in the sale of intoxicants pretend are more enforceable than prohibiting and sale, but which in practice are just as difficult, and many absolutely impossible, to carry out. The fact that there have been no convictions under any of them is suggestive. Thus, Government liquor sellers may not sell to those convicted of drunkenness, nor to habitual drunkards, nor to inmates of public institutions, nor to policemen on duty, nor to the Indians, or Eskimo, nor to any minors, nor to owners or inmates of disorderly houses. Bottles must have a label on which the Government endorsement is plainly marked. Those who sell liquor must not engage in other remunerative occupations. The Government sells eight brands of rum, which is the intoxicant most consumed in the Island. Its brandy is expensive, and so are its liqueurs, of which it sells twelve varieties. The law only allows each adult to purchase one bottle of intoxicating liquor per day

three hundred and twelve days per year. The Government may not establish a sales depot in a community without a two-thirds majority vote for it and so far not a single town or outport has asked for this blessing. Moreover, St. Pierre and Miquelon still are on the map, and it has not yet been shown that the new law has caused any change of heart in their liquor traders. The experience of the Seamen's Institute was that prohibition was much better than the present arrangement.

The imports and exports are as follows for 1926-27:—

	Imports	Exports
	\$	\$
Canada	11,635,110	2,087,496
U.S.	8,553,567	9,429,038
United Kingdom	4,527,533	6,273,344
Ceylon	305,058	
British West Indies	221,026	1,188,340
Spain	144,698	2,799,587
Norway	70,458	
Holland	68,790	819,133
Germany	51,509*	76,117†
France	32,424*	300
Greece	28,478	444,358
Belgium	47,674	25
and a few other imports, making in all	25,813,871	
Brazil		2,620,813
China		3,734
French West Indies		598,038
Italy		1,346,653
Madeira		114,327
Portugal		2,664,398
Exports in all		30,839,859

*Steadily increasing.

†Steadily decreasing.

*Increasing since prohibition closed.

Newfoundland's greatest new financial developments have, however, been in the exports of paper and pulp, and the opening of new mines. For the first time in her history, the value of any other industry has equalled that of the island's codfish—that being her export of paper:—1927, \$12,057,440 codfish against \$12,517,665 paper, and this latter promises to grow rapidly.

The history of this is interesting. Lord Northcliffe opened the first undertaking in 1909, with far more extensive and better timbered areas than he could have obtained in Canada or America, with cheaper labour, far more favourable legislative grants to the industry, with better wood (as its black spruce has proved), and cheaper and quicker manufacturing facilities. The fir, at first difficult to use, has been also most successfully handled; it might be all used for artificial silk instead of newspaper sheets. A splendid remunerative business has been built up, which, with new adaptations such as using a southern harbour, called Heart's Content for shipping, makes only a short storage during winter necessary for material produced, and even that, if essential, could be avoided by carrying it to St. John's, an all-the-year-open harbour. The whole management of the business has been admirable as far as Newfoundland is concerned, and every kind of progressive method has been introduced to improve the scale of living and to carry high standards in every department at their capital at Grand Falls. The possession of two fine falls, the Grand Falls and Bishop's Falls, has completely solved their power problems. To Sir Mayson Beeton, as well as to Lord Northcliffe, the island owes a very big debt.

A larger and more ambitious paper mill has been that of the Whitworth Armstrong Company at Corner Brook, on the west coast, at the mouth of the Humber River. The amount of money invested has been variously estimated, but considerably over \$50,000,000. The result has been a stupendous plant, with every modern improvement for the industry. The hydro-electric power alone of Deer Lake gives sixty-five thousand horse power. This gives employment to many thousands of men in logging in winter—an invaluable help to the summer cod fishing. The total output goes to America, chiefly, to two big newspapers. It takes forty years to grow one tree in Newfoundland of sufficient

size for profitable pulping, with ten inches across at the lower end. Ninety-seven thousand tons of paper were put out last year from Newfoundland. To pay, Corner Brook must put out one hundred and eighty thousand cords. The splendid harbour, steamers, hotel, machinery, and village that has been built up promise, so long as the forests are conserved, to be an enormous asset for the finances of the country. But the great outlay proved too much for the original company, and in 1927, the whole concern was handed over at a very greatly reduced cost to the International Paper Company of America.

Communications.—Except for the immediate neighbourhood of St. John's, and the little peninsula of Avalon, roads have been characterized chiefly by their absence, the whole of the north being treated as if it were another world. There scarcely a yard of good road exists, and progress has been proportionately retarded. In the year 1925 the government of Mr. Walter Monroe decided to borrow money for better roads, and generally to make a serious bid for the tourist traffic.

The railways of Newfoundland, which are a little over 900 m. in length, and especially the 500 m. from St. John's to the west coast, have done a great deal to foster trade and travel to Canada and the United States. Owing to the difficulty in winters of crossing the high land, over which the rails were carried, owing to the scattered nature of the small settlements, through which the line passes, and the little amount of inter-town traffic, the railway has been run at an increasing loss annually. The line, as far as Harbour Grace, was finished in 1884, and to Placentia in 1888. In 1893, Mr. R. G. Reid of Montreal was granted a contract to build the rest of the road, which in 1898 was altered to a grant of the whole railway to the contractor at the end of 50 years, provided he operated it free of expense to the Colony, for that period of time. It gave him also, beyond 5,000 ac. in fee simple granted before, 2,500,000 ac. along the route. Mr. Reid was also to build and ply seven steamers for coastal service, including one for Labrador, he was to provide an electric street railway for St. John's, pave part of the capital, and he became owner of the dock, built an electric lighting system for the city, and acquired the Government telegraph system. He was also to pay a million dollars in cash to the Government.

In 1923 the Government bought out the Reid interests for \$2,000,000. They also took over the railroad, and steamers and docks. They had previously taken back their own telegraphs. The line, which is only a narrow gauge one, had fallen into great disrepair, and another million and a half dollars at once had to be spent on the track, and over \$600,000 on the rolling stock, ties, bridges, and the buildings. The narrow gauge, and light carriages, have led to delays and troubles from weather and the railway has not been financially successful. Total receipts of the dock and steamship service and railways are:—in 1927, \$3,009,190, and for the same period the expenditure was \$3,753,087—a deficit of \$743,897. In 1924-25 Earnings were \$3,371,200, Expenditure, \$3,729,710, Deficit, \$358,509. These figures include the returns from the freight and passenger service and traffic. Mails, Pullman cars, express, steamers, dock shop and dry dock and miscellaneous are included. The steamers and dock actually showed a small profit.

The newspapers of the country are in St. John's, the Royal Gazette, the Daily News, the Evening Telegram, the Fishermen's Advocate, the Free Press, The Newfoundland Quarterly, and there are half a dozen other papers in various outposts. There are 21 foreign consuls in St. John's.

Good tugs and pilots offer every facility for entering the port. The country now maintains over 200 lighthouses around her shores. Owing to a dangerous current in the neighbourhood of St. Mary's Bay and Cape Race, and also to the frequent heavy fogs that bank often in that vicinity, while icebergs reach as far as there on the Polar Current, that region has not been inappropriately called the "Graveyard of the North Atlantic," so many wrecks having occurred there. It is studiously avoided by mariners, but has, through the years, claimed many notable victims, and has been the scene of many romances and tragedies. Hotels in the Island for accommodation of tourists are slowly increasing.

St. John's has a large, modern repairing dry dock, a museum, two cathedrals, and the usual quota of public buildings, of which the Government House is the finest and most interesting, are also in the capital.

Sport.—All details regarding sport can be obtained simply by writing to the Secretary of the Game and Island Fisheries Board at St. John's. The rules are not burdensome, and the expense not

ST. JOHN'S HARBOR FROM SIGNAL ROCK

great. Good guides, who must be licensed, can be obtained without difficulty, and often tents and canoes can be hired in the district selected. It is well, however, to make certain of this. All apparatus and outfit introduced into the country is liable to customs' duty, and sportsmen may have to deposit at the port of entry money to the value of the duty charged, but this will be returned upon leaving the country. Any necessary supplies can always be obtained in the excellent large stores in the capital. Caribou hunting is undergoing a closed season. The willow grouse shooting is excellent, and attainable in any part of the island. The close season is Jan. 1. to Sept. 20. Capercaillie and black game, both of which have been introduced, have no open season. The moose also are protected. Carrying of firearms, except to a genuine traveller, is forbidden on Sundays, and in close seasons. No license is required.

Salmon or trout fishing can be obtained everywhere, the kind depending only on the size of the river. The close season is Sept. 15 to Jan. 15. Every river is preserved by the Government, and none are closed to the public. Many kinds of fur-bearing animals are indigenous. Foxes of various colours, lynx, martin, muskrat, otter, beaver, hares and rabbits, are numerous.

Postal Service.—The Colony issues its own stamps of many denominations. They are beautifully and variously engraved, and are frequently changed, with some advantage to the revenue. It costs three cents to the United States, Canada, or in the Colony, whereas postage from the United States to Newfoundland is only two cents. Parcels up to 22 lb. weight are accepted from England by post, and up to 11 lb. from Canada and the United States. The Government owns 5,000 m. of telegraph lines all round the country, and 2,000 m. of telephone wires, besides a string of wireless telegraph stations as far North as Makkovik islands in North Labrador. The British news despatch from Rugby, England is picked up daily, and published. During the summer months, mails are carried largely by steamers to the North, and in winter from Bay of Islands North around the bottom of White Bay, including Labrador, the mails are carried by couriers and dog sledges. The Furness-Withy steamers from Halifax to Liverpool call at St. John's, completing the voyage from St. John's in six days. The Red Cross steamers from New York take five days.

HISTORY

DISCOVERY AND COLONIZATION

Newfoundland, commonly termed the "senior colony" of Great Britain, antedates in discovery (though not in continuous settlement) any other British over-sea dominion. John Cabot, sailing from Bristol in 1497, appears to have made landfall at Bonavista and claimed the whole country for Henry VII. Three years later Gaspar Corte-Real, ranging the North American coasts, discovered and named Conception bay and Portugal cove, and was appointed Portuguese governor of Terra Nova. The long series of annual trans-Atlantic expeditions followed upon the voyages of Cabot and Corte-Real, and their reports in England, Portugal and France concerning the multitude of fish in Newfoundland. The belief that English fishermen did not avail themselves to any extent of these advantages until the middle of the 16th century is now shown to be erroneous. In 1527 the little Devon fishing ships were unable to carry home their large catch, so "sack ships" (large merchant vessels) were employed to carry the salt cod to Spain and Portugal. An act of 1541 classes the Newfoundland trade with the Irish, Shetland and Iceland fisheries. Hakluyt, writing in 1578, mentions that the number of vessels employed in the fishery was 400, of which only one-quarter were English, the rest being French and Spanish Basque. But in the same year, according to Anthony Parkhurst, "the English are commonly lords of the harbours where they fish and use all help in fishing if need require." Shortly thereafter England awoke to the importance of Cabot's great discovery, and an attempt was made to plant a colony on the shores of the island.

CLIFFS AT THE HARBOR ENTRANCE OF ST. JOHN'S

Sir Humphry Gilbert, provided with letters patent from Queen Elizabeth, landed in St. John's in Aug. 1583, and formally took possession of the country in the queen's name. The first attempt at colonizing was frustrated by the loss of Gilbert soon afterwards at sea. In 1610 James I. granted a patent to John Guy, an enterprising Bristol merchant, for a "plantation" in Newfoundland; but no marked success attended his efforts to found settlements. In 1615 Captain Richard Whitbourne of Exmouth in Devon was despatched to Newfoundland by the British admiralty to establish order and correct abuses which had grown up among

the fishermen. On his return in 1622 he wrote a "Discourse and Discovery of Newfoundland Trade" which King James, by an order in council, caused to be distributed among the parishes of the kingdom "for the encouragement of adventures unto plantation there." A year after the departure of Whitbourne, Sir George Calvert, afterwards the first Lord Baltimore, obtained a patent conveying to him the lordship of the whole southern peninsula of Newfoundland, and the right of fishing in the surrounding waters. He planted a colony at Ferryland, 40m. north of Cape Race, where he built a handsome mansion and resided with his family for many years. The French so harassed his settlement by incessant attacks that he at length abandoned it.

In 1650, or about a century and a half after its discovery, Newfoundland contained only 350 families, or less than 2,000 individuals, distributed in fifteen small settlements, chiefly along the eastern shore. These constituted the resident population; but in addition there was a floating population of several thousands who frequented the shores during the summer for the sake of the fisheries, which had now attained very large dimensions. So early as 1626, 150 vessels were annually despatched from Devon alone. The fish caught were salted and dried on the shore; and on the approach of winter the fishermen re-embarked for England, carrying with them the products of their labour. Hence it became the interest of these traders and shipowners to discourage the settlement of the country, in order to retain the exclusive use of the harbours and fishing coves for their servants, and also a monopoly of the fisheries. They were able to procure the support of the English government of the day for this system, and stringent laws were passed prohibiting settlement within 6m. of the shore, forbidding fishermen to remain behind at the close of the fishing season, and rendering it illegal to build or repair a house without a special licence. The object of this short-sighted policy, which was persisted in for more than a century, was to preserve the island as a fishing station and the fisheries as a nursery for the English fleet.

There was, however, another element which retarded the prosperity of the country. The French had early realized the immense value of the fisheries, and strove long and desperately to obtain possession of the island. Their constant attacks and encroachments harassed the few settlers, and rendered life and property insecure during the long wars between England and France. When at length, in 1713, the treaty of Utrecht ended hostilities, it did not deliver Newfoundland wholly from the grasp of France, as it gave the latter the right of catching and drying fish on the western and northern sides of the island. Though no territorial rights were conferred on the French, and the sovereignty was secured to England, the practical effect was to exclude the inhabitants from the fairest half of the island.

In spite of the restrictive regulations, the number of the resident population continued to increase. The sturdy settlers clung to the soil, and combated the "adventurers" as the merchants were called. The latter strenuously opposed the appointment of a governor; but at length, in 1728, the British government appointed Captain Henry Osborne first governor of Newfoundland, with a commission to establish a form of civil government. This constituted a new era in the history of the colony. In 1763 the fixed inhabitants had increased to 8,000, while 5,000 more were summer residents who returned home each winter. In 1763 the coast of Labrador, from Hudson's Strait to the river St. John opposite the west end of the island of Anticosti, was attached to the governorship of Newfoundland. The population in 1785 had increased to 10,000. During the wars between England and France which followed the French Revolution, Newfoundland attained great prosperity, as all competitors in the fisheries were swept from the seas, and the markets of Europe were exclusively in the hands of the merchants of the island. The value of fish trebled, wages rose to a high figure, and in 1814 no less than 7,000 emigrants arrived. The population now numbered 80,000. In 1832 representative government was granted to the colony, and provision was made for education. In 1846 a terrible fire destroyed three-fourths of St. John's and with it an enormous amount of property; but the city rose from its ashes improved and beauti-

fied. In 1855 the system of responsible government was inaugurated. In 1858 the first Atlantic cable was landed at Bull Arm, Trinity Bay.

Unproductive fisheries, causing a widespread destitution among the working classes, marked the first eight years of the decade between 1860 and 1870. A system of able-bodied pauper relief was initiated to meet the necessities of the case but was attended with the usual demoralizing results. The necessity of extending the cultivation of the soil in order to meet the wants of the growing population was felt more and more as the pressure arising from the failure of the fisheries evinced more clearly their precarious nature. In 1864 copper ore was discovered in the north, and mining operations were successfully initiated. In 1869 a series of successful fisheries began which enabled the government to terminate the injurious system of able-bodied pauper relief. In 1871 the revenue rose to \$831,160. In 1873 direct steam communication with England and America was established.

THE FISHERIES

French Claims.—By the treaty of Utrecht of 1713 a right was reserved to French subjects to catch fish and to dry them on that part of Newfoundland which stretches from Cape Bonavista to the northern part of the island and from thence coming down by the western side reaches as far as Pt. Riche. By the treaty of Versailles of 1783 France renounced the fishery from Bonavista to Cape St. John on the east coast, receiving in return extended rights upon the west coast as far as Cape Ray. Neither treaty purported to grant exclusive right, but there was annexed to the treaty of Versailles a declaration to the effect that "His Britannic Majesty will take the most positive measures for preventing his subjects from interrupting in any manner by their competition the fishery of the French during the temporary exercise of it which is granted to them upon the coasts of the island of Newfoundland, and he will for this purpose cause the fixed settlements which shall be formed there to be removed." Upon this declaration the French founded a claim to exclusive fishing rights within the limits named. A convention was entered into with a view to defining these rights in 1854, but it remained inoperative, the consent of the Newfoundland legislature, to which it was made subject, having been refused. Meanwhile the French government

FISHING BOATS IN ST. JOHN'S HARBOR

granted a bounty to the French fishermen which enabled them to undersell the colonists.

Twice, in 1884 and in 1885, a convention arranged between the British and French governments was submitted to the colonial legislature which, however, absolutely refused to ratify the arrangement unless the French government would consent either to annul or to amend the system of bounties paid upon French-caught fish in Newfoundland waters. To counteract the effect of these bounties, which pressed very hardly upon the British competition, a Bait Act was passed in 1886, empowering the executive to pro-

hibit the capture in Newfoundland waters for exportation or sale of bait fishes, except under special licence to be issued by the colonial government. The consequence of this measure, had its provisions been properly enforced, would have been to place an embargo upon the local supply of bait requisite to the French fishermen—the so-called “metropolitan fleet”—on the Grand Banks. The French government immediately demanded that Great Britain should deny its sanction to the Newfoundland Bait Act, and pressed their objections with such persistence as to induce Lord Salisbury to disallow the measure. Nevertheless, the despatch of the governor, Sir William des Voeux, to the colonial secretary, Sir H. Holland, was entirely in favour of the principle of the bill. In 1887, at the conference of Colonial Premiers attending Queen Victoria's Jubilee the subject was argued at considerable length. The claim of the senior colony “to control and legislate for her own fisheries” met with general approval, the single dissident being the representative of Canada, who feared that Canadian fishermen would suffer under the bill. When an assurance was tendered that Canada's fishermen would be placed upon the same footing with those of Newfoundland, the British government somewhat reluctantly sanctioned the Bait Act. In the meantime the chagrin of the French Foreign Office at the failure of negotiations, and the hostile attitude taken up by the Newfoundlanders induced de Freycinet to devise retaliatory measures. Instructions were issued “to seize and confiscate all instruments of fishing belonging to foreigners resident or otherwise, who shall fish on that part of the coast which is reserved to our use.” Lord Rosebery, then foreign secretary, protested to the French ambassador against the spirit of these instructions, which he insisted were in direct contravention of the treaty, inasmuch as they ignored the concurrent as well as those sovereign rights of Great Britain which France solemnly undertook by the treaties never to question or dispute. About 1874 a Nova Scotian named Rumkey had established the first factory for the canning of lobsters on the west coast. This concern proved profitable, and others sprang up, until, at the close of the season of 1887, Captain Campbell, R.N., reported that 26 factories were at work, employing about 1100 hands. The year of the Bait Act's first successful application was marked by the stoppage, by order of the French government, of one of the largest factories, and by their contention that the lobster-canning industry formed a part of the exclusive privileges conceded under the treaties to the French. “France,” it was then declared, “preserved the exclusive right of fishing she always possessed. This right of France to the coast of Newfoundland reserved to her fishermen is only a part of her ancient sovereignty over the island which she retained in ceding the soil to England, and which she has never weakened or alienated.” The French government then voted (1888) a special bounty for the establishment of lobster factories by their subjects on the treaty coast. Acting under a statute passed in the reign of George III., empowering British naval officers to interpret and enforce the treaties, Sir Baldwin Walker and others proceeded to destroy or remove a number of British factories at the request of the French agents. In 1890 the unexpected discovery was made that the act empowering British naval officers to enforce the provisions of the treaties with France had expired in 1832 and had never been renewed. Consequently all the proceedings of which the colonists had been the victims were illegal. One of them, James Baird, immediately took proceedings against Sir Baldwin Walker in the supreme court, which decided in his favour, mulcting the admiral in £1,000.

On an appeal to the privy council the decision was upheld. But before this incident had taken place, the controversy between London and Paris culminated in the *modus vivendi* of 1890, by which the lobster factories, both British and French, which were in existence on July 1, 1889, were to continue for the present. Instantly the colony took alarm, and a deputation consisting of the island's leading men was sent to England to protest against both the principle and practice of such an arrangement. On their return they learnt that it was the intention of the imperial government to re-enact *verbatim et literatim* the act for the enforcement of the treaties which had expired 59 years previously

To prevent such an occurrence, delegates from both parties in Newfoundland visited London in April 1891, and, appearing at the bar of the House of Lords, promised that if the measure which was then on the eve of being introduced into that body were withdrawn, a temporary measure would be passed by the Newfoundland legislature which would answer the same purpose of enabling Great Britain to carry out her treaty obligations with France. For a number of years the *Modus Vivendi* Act was annually passed by the legislature, each year under protest.

In 1898 the secretary of state, Joseph Chamberlain, yielding to the urgent request of the senior colony, despatched a royal commission of investigation to the “French shore,” and three years later a new conference was held in London. Later in the same year negotiations were begun between the British and French governments for a general treaty.

On April 8, 1904 the Lansdowne-Cambon Convention was signed, which, *inter alia*, effected a final settlement of the French shore question. Territorial concessions were made consisting of a modification of the Anglo-French boundary line in the Niger and Lake Chad district, and a re-arrangement of the Gambia-Senegambia frontier, giving Yarbata to Senegambia. The Los Islands opposite Konakry Island were likewise ceded to France. Individual claims for indemnity were duly submitted to an arbitral tribunal, composed of an officer of each nation; and at length what is known as the Lyttelton Award, was made as follows:—

General award for French rights	\$255,750
Loss of occupation	226,813
Effects left by the French on treaty coast	28,936

Thus, so far as concerned the French, was an end put to a situation on the treaty shore, which for nearly 200 years had given rise to difficulties and anxieties.

American Claims.—Scarcely, however, had a year elapsed from the signing of the convention, when another international disagreement connected with the fisheries assumed grave importance. There had long been intense dissatisfaction in the Colony over the attitude of the American government and American fishermen towards the colony. The action of the American Senate in rejecting the Bond-Hay treaty negotiated in 1902 stirred the colonial government to retaliatory measures. By virtue of the treaty of 1818 American fishermen enjoyed the right, in common with British fishermen, to prosecute their industry within certain defined areas. But America then formally renounced for ever “any liberty heretofore enjoyed or claimed . . . to take, dry or cure fish on or within three marine miles of any of the coasts, bays, creeks or harbours of His Britannic Majesty's dominions in America” not included in the stated limits, with one qualification: “that American fishermen shall be permitted to enter such bays or harbours for the purpose of shelter and of repairing damages therein, of purchasing wood, and of obtaining water and for no other purpose whatever.” In 1905 an act was passed by the colonial legislature imposing certain restrictions on American vessels, and a further more stringent act in 1906, preventing Newfoundlanders from joining American vessels. These acts were resented by the American government, which, through Secretary Root, called upon the British government to disallow such interferences on the part of the Newfoundland legislature. Lord Elgin's reply was to suggest a *modus vivendi* pending further discussion of the questions at issue. In spite of the colony's energetic protest, a *modus vivendi* was agreed to in Oct. 1906, whereby the Foreign Fishing Vessels Act of 1906 was held in abeyance, and the act of 1905 was held not to apply to American fishing vessels, and light dues were waived, while on the other hand American vessels were to report at the custom house on entry for clearance, and their fishermen were to comply with colonial fishery regulations. The American government consented to waive Sunday fishing by the Americans, which was an important colonial grievance, if the use of purse seines by American fishermen were allowed. Lord Elgin's action was considered to be an interference with the internal affairs of the colony and great public indignation was aroused. Retaliatory measures were resolved upon, Newfoundland fishermen being declared liable to fine and imprisonment for selling bait to the Americans or for joining

American vessels. The legislature voted an address to the imperial government, protesting against the *modus vivendi*, and this was carried to England in 1907 by Sir Robert Bond, the premier of the colony. Finally the matter was referred to The Hague tribunal for arbitration, which gave its award in Sept. 1910, the two main points at issue being decided as follows: (a) Great Britain had the right to make regulations for the fisheries without the consent of the United States, subject to the provisions of the treaty of 1818. (b) The "three-mile limit" in bays (subject to special judgment in individual cases) was to be taken from a line across the bay at the point, nearest the entrance, where a width of ten miles is not exceeded. Among other provisions it was decided that American vessels might employ foreign hands (but these received no benefit under the treaty); also that they might be required to report to custom houses if facilities to do so existed

THE LABRADOR JUDGMENT

In the opening decades of the century the question of Newfoundland's claim to Labrador became an urgent one. It had indeed been raised about 1888 and was a subject of discussion at the Halifax Conference of 1892. But not until 1903 did the Government of Canada, learning that the Newfoundland Government had issued a timber licence in the Hamilton river region, seriously challenge the island's ownership. In the succeeding years the rival claims of Canada (or to be more precise, the Province of Quebec) and Newfoundland were subjected to close and skilled investigation, especially since, in 1920, it was agreed to accept an adjudication by the Judicial Committee of the Privy Council. The case was heard in 1926 before the Lord Chancellor, and Lords Haldane, Finlay, Sumner and Warrington, the arguments lasting for fourteen days. In March, 1927, a decision was rendered, in which Newfoundland's claim was upheld. The Judicial Committee found "the boundary between Canada and Newfoundland in the Labrador peninsula to be a line drawn due north from the eastern boundary of the bay or harbour of Ance Sablon as far as 52° N. and from thence westward along that parallel until it reaches the Romain river, and then northward along the left or east bank of that river and its headwaters to their source, and from thence due north to the crest of the watershed or height of land there, and from thence westward and northward along the crest of the watershed of the rivers flowing into the Atlantic Ocean until it reaches Cape Chidley." This important judgment which first formally established the island Dominion's claim to territory nearly three times its own extent, caused great rejoicing in Newfoundland. It enabled the varied natural resources of the disputed region to be accessible at last to those desiring a valid title. The taking of the watershed as the boundary was held to remove the danger of any further dispute. The territory awarded is estimated (1928) to contain spruce forests valued at \$50,000,000.

1912-28.—The inauguration in 1912 of the Fishermen's Union, which established large trading stores in all the principal outposts and had as its political object the safeguarding of the interests of the fishermen by means of representation in the Legislature, was the outstanding political event of the immediate pre-war period. In the elections of Nov. 1913, although the Government of Sir Edward Morris was re-elected, the candidates of the Fishermen's Protective Union (F.P.U.) won all the constituencies in the north and northeast. On the outbreak of the World War a Newfoundland regiment was formed and served overseas in Gallipoli, Egypt and France. Altogether some 6,500 men joined up for service. In 1917 the Morris Government was enlarged into a National Government by the inclusion of the Opposition, in order to expedite measures dealing with war requirements. At the end of 1917 Sir Edward Morris resigned, and was succeeded by Mr. (Sir) William Lloyd, the former leader of the Opposition.

In 1919 Sir William Lloyd attended the Peace Conference as the representative of the Colony. During his absence his Government was destroyed by internal dissensions, and Mr. (Sir) Michael Cashin became Premier. The elections of Nov. 1919 were marked by extreme bitterness, religious feeling being intro-

duced to a great extent. A considerable turnover of votes resulted, and the Government was defeated by a party led by Mr. (Sir) Richard Squires, whose Government was re-elected in 1923. Shortly afterwards Sir Richard Squires resigned as a result of grave charges preferred against him in the Legislature, including, amongst others, the receipt of money from private corporations and the diversion of government funds to persons occupying high official posts. The Attorney-General, William Warren, had assumed the leadership, but on the opening day of the legislative session of 1924 his ministry was defeated. It was reconstructed, but without avail and the election of 1924 resulted in a victory for the party led by Walter Monroe.

Among the measures passed in 1925 was one abolishing Prohibition, which had proved unworkable and the substitution of government control of liquor, on the pattern of the Quebec law. The Monroe ministry was pledged to economy and reform, but its difficulties were many, there being much opposition to nearly all its measures of retrenchment. Although revenue was declining and expenditure increasing, a considerable party clamoured for still further loans, to provide bounties on fish and new roads. Only by a steady resistance to these demands was the Government able during the years 1925-28 to balance its revenue.

Projects for Union with Canada.—In 1900 the British admiralty, acting upon the repeated suggestions of Sir Charles Dilke and others interested in the manning of the navy, decided to initiate a branch of the imperial naval reserve in the Colony. In 1901 a difficulty arose about paying the men, owing to the lack of any provision for that purpose in the Imperial Reserves Act under which they were enlisted. The Colony was asked to bear the cost; its refusal was followed (1902) by the enactment of special legislation rendering the enrolment and maintenance of the reserves in Newfoundland a special imperial undertaking. Several efforts had been made to induce Newfoundland to confederate with the Dominion of Canada, but the project never met with any degree of favour with the electorate. After the insolvency of the colony in 1894-95, a delegation was sent to Ottawa to ascertain if it were possible to arrange terms of confederation; but Sir Mackenzie Bowell's government objected to the assumption by the Dominion of the entire amount of Newfoundland's debt (then only \$16,000,000), and the negotiations were abandoned. The Labrador decision of 1927 revived the project in Canada; but Newfoundland would appear to be satisfied with its separate Dominion status.

NEW GLARUS, a town and a village of Green county, Wisconsin, U.S.A., about 22 m. S.W. of Madison, on the Little Sugar river, a branch of the Rock river. Pop. town (1920) 554; village, which was separated from the town in 1901 (1920) 981. New Glarus is served by a branch of the Chicago, Milwaukee and St. Paul railway. It has agricultural and dairying industries, but little or no manufacturing interests. It had its origin in a colonizing experiment made by the canton of Glarus, Switzerland, in 1845. Agents sent by the canton chose the site of New Glarus largely because the rocky slopes of the valley suggested their Alpine home. The settlers brought with them a "form of government" drawn up by the Cantonal Council of Glarus and providing in great detail for a system of schools, for what was practically a State church (Reformed Lutheran) supported by tithes, for a system of poor relief, for a system of courts and for a set of town officers elected on a limited property franchise. The original plan provided also for an equitable distribution of land to each head of a family. With such adjustments as were found necessary for co-ordination with the town and county Governments of Wis-

consin, it remains practically the same to this day. The village and town still have an Old World aspect.

NEW GLASGOW, a manufacturing and mining town of Pictou county, Nova Scotia, Canada, on the East river, near its entrance into Pictou harbour, and the Canadian National railway, 104 m. N.E. of Halifax. Pop. (1921) 8,974. Extensive coal mines are in the vicinity, and there are manufactures of iron and steel, mill machinery, door and sash factories, as well as several ship-building yards.

NEW GRANADA (Span. *Nueva Granada*), the title under Spanish colonial administration of that part of South America now known as the republic of Colombia, which at one time was extended to include Venezuela and Ecuador. It also was for a time the title of the united territories of Panama and Colombia under republican auspices. The Bogotá plateau was invaded from the Caribbean coast and conquered in 1537 by Gonzalo Jiménez de Quesada, who, in honour of his native province, called it the "Nuevo Reino de Granada." In 1550 an *audiencia real* under the viceroyalty of Peru was established at Santa Fé (Bogotá), but in 1564 this isolated group of Spanish settlements was transformed into a presidency. In 1718, owing to the unmanageable size of the viceroyalty of Peru, it was divided and a new viceroyalty was created from the various provinces lying in the north-western angle of the continent, extending from Tumbez northward to the northern limits of Panama, and eastward to the Orinoco, to which the name of Nueva Granada was given. The new viceroyalty included the provinces of Tierra Firme (now the republic of Panama); Maracaibo, Caracas, Cumana and Guyana (now included in Venezuela); Cartagena, Santa Marta, Rio Hacha, Antioquia, Pamplona, Socorro, Tunja, Santa Fé, Neiva, Mariquita, Popayan and Pasto (now included in Colombia); and Quito, Cuenca and Guayaquil (now included in Ecuador). In 1777 the provinces of Maracaibo, Caracas, Cumana and Guyana were detached from the viceroyalty to form the captaincy-general of Caracas; otherwise it remained as above until the termination of Spanish rule in South America.

For the republic of Colombia (1819-30), the republic of New Granada (1831-61), the United States of Colombia (1861-86) and the republic of Colombia (1886 to date), see COLOMBIA.

NEW GUINEA, island, of estimated area 312,329 sq.m., stretching from the equator in the north-west to 12° 5' S. in the south-east and from 130° 50' E. to 151° 30' E.; separated from Australia by the shallow Torres strait and Arafura sea. On its eastern side lies the Bismarck archipelago.

STRUCTURE AND PHYSICAL GEOGRAPHY

The island consists of a long central mountain chain of complex formation, a northern coastal range, and a small planed down hill country on the south coast, west of the mouth of the Fly river, together with the alluvial surfaces formed mainly by the rivers under the influence of equatorial rains. The structure shows, in the west, the influences of great earth movements ranging from the Banda sea. These give arcs (1) Banda islands, (2) Buru, Ceram, West Timorlaut, (3) East Timorlaut, Kei islands, coastal mountains of south-west New Guinea from the Baik mountains to Cape Fatingar, thence Misol island, Obi island, and then north on the west side of Halmahera. This curve is separated, in West New Guinea, from the central chain by the deep McCluer inlet. The central chain stretches from north-west to south-east. In the west the ranges of the central chain are called Charles Louis Mts. and then for a while, still in Dutch New Guinea, the name Nassau Mts. is used. Here the snow line is approximately at 14,600 ft. and Mt. Idenburg (15,150 ft.) and Mt. Carstens (16,400 ft.) have glaciers. The next section is the Orange Mts. with Mt. Wilhelmina (15,312 ft.). There seems to be a more or less parallel range 25-45 m. to the north of this succession of ranges, and in it a height of 12,500 ft. has been observed in the Weijland mountains. The composite nature of the great chain is maintained eastwards and it is believed that the main watershed lies in the Mandated and not in the British Territory. In the former a height of 13,700 ft. has been found in the Otto Mts.; on the south flank the chain grades into a complex of mountains of

lesser height. The south-eastern part of the chain called the Owen Stanley range (Mt. Albert Edward, 13,220 ft.) declines gradually to the end of the long peninsula.

Towards the west the central chain is formed principally of palaeozoic sandstones and slates on which much younger rocks, nummulitic sandstone and limestone are laid. In Dutch New Guinea, the lower mountain country is of Miocene rock. Towards the south-eastern peninsula there are again old rocks, some with gold-bearing quartz, especially along the axis, as well as granite and folded Tertiary limestone on both coasts of the peninsula; here also, and in the d'Entrecasteaux islands is much evidence of volcanic activity (Miocene, Pliocene, Pleistocene and recent).

The northern coastal range in Dutch New Guinea is said to reach a height of about 6,900 ft.; it declines towards the mouth of the Sepik, beyond which it rises again to a height of about 10,500 ft. and ends at King William's cape. It is formed of ancient elements with diorites, gabbro, andesites, etc., mostly covered with Tertiary and even possibly younger sediments, and is probably still in process of uplift; recent coral reefs adorn some cliff sides and may reach a level of some 5,500 feet. There is abundant evidence in New Guinea of large earth movements from Miocene times onwards, with a probable maximum in the Pliocene or Pleistocene. The southern hills between the mouths of Digul and Fly rivers are an extension of Australia structurally. Between these lines of hills there run lowlands, floored near the Idenburg river by Pliocene sandstones.

The most important rivers are the Mamberamo, reaching the sea north of the Nassau range; the Sepik, also on the north, navigable by seagoing steamers for 180 m.; the Fly river flowing into the Gulf of Papua, navigable by a whale boat for 600 miles; and the Digul in the south-west. Many of the rivers have gold, but it is important in few places save the Louisiade archipelago beyond the south-east extremity and Woodlark island. Murua (Woodlark island) beyond the d'Entrecasteaux islands has banded quartzite much valued by the people for the making of stone adzes. Petroleum occurs near the coast of the Gulf of Papua.

Climate.—In the northern summer the south-east trades dominate New Guinea; they bring rain to the south-east peninsula but the rain diminishes farther west on the south side as the wind is affected more and more by the passage across the corner of Australia. Northward on the east coast the rain at this season appears to be very heavy where the land faces south-east. Farther west there is little rain while the south-east trades blow. In the southern summer, New Guinea is on the wind-path from Asia, round to the very marked Australian low pressure centre. The wind is swinging round from the north-west to north-easterly direction and it brings heavy rain to northern New Guinea and to the southern part of the Dutch Territory. In one place in the rain shadow of the northerly mountains an annual rainfall of 96 in. has been measured, but on the exposed heights, especially between 3,000 and 6,500 ft., it must be enormously greater. In the lowlands the convection currents rule all the year round, but the amount of rain varies. The temperature remains near the average of about 81° declining to about 72° and rising to about 92° as rough monthly averages. 72° is not far from the average morning, and 92° not much above the average noon, temperatures.

Flora and Fauna.—The general vegetation is that of the rain-forest, but under the conditions of great heat the rain-forest cannot grow where there is a long dry season. The tree limit is more than 10,500 ft. above sea-level. Towards the mountain tops one finds European (*Rubus*, *Ranunculus*, *Leontodon*, *Aspidium*), Himalayan, New Zealand (*Veronica*), South American (*Drymus*, *Libocedrus*) and even Antarctic species. From 6,000 ft. upwards fine Agapetes (*Ericaceae*), pines (*Araucaria*, *Libocedrus*) and palms adapted to hill-life abound. In the lower lands palms are very abundant, and along the tidal courses of rivers those of the genus *Nipa* are common; sago palms are numerous in the seasonal swamps while grass and cane swamps occur where the land remains long under water. On the Alang steppe is the tall, tough grass, *Imperata arundinacea*.

New Guinea was probably united to Australia as recently as Pleistocene times, whereas its last effective connections farther

west are much older. It thus belongs in the main to the Australian region with nine species of *Echidna* (*Monotremata*) and 84 of marsupials among which are two genera peculiar to the island (*Distoechurus* and *Dorcopsis*). Small kangaroos live on the borders of steppe and forest in the higher lands. Bats abound and there is a pig (*Sus papuensis*), a dingo and 50 indigenous species of rats and mice chiefly on the steppe, and a few squirrels. The bird fauna includes well over 500 species and at least 50 genera are peculiar to the island. Birds of prey hover over the steppe and catch rats and mice, but apparently they avoid the great forests and here flourish the famed birds of paradise, which are absent from all the islands east of New Guinea. The Bismarck islands have birds allied to those of New Guinea but 74 species are peculiar to them. Turtles and tortoises are plentiful on the coast and have curious relationships with South American forms; many lizard species are peculiar to the island but comparatively few snakes. Amphibia are abundant and of Australian affinities. Insects are very numerous and the butterflies are gorgeous. Land molluscs are related to those of India and Malaya.

POLITICAL DIVISIONS

British New Guinea (TERRITORY OF PAPUA).—Area about 90,540 sq.m., European population 1,452. Natives variously estimated 114,000 to 275,000. A British protectorate was declared in 1884 after the Government of Queensland had annexed the land in 1883, and after various changes it became (1906) the Territory of Papua under the governor-general of Australia, with a lieutenant-governor of its own. An executive council of one unofficial and eight official nominees helps the lieutenant-governor and also forms part of the legislative council, which has five additional unofficial nominees. There are eight magisterial districts and a central court at Port Moresby, and an appeal thence to the high court of the commonwealth. There are now two government anthropologists. Some simple regulations of native government are administered with the help of (in 1926) 1,024 village constables. About 190,000 ac. of land have been leased, chiefly by planters, and over 62,000 are cultivated, chiefly for coconuts, rubber and sisal. Land may not be bought freehold. Natives may establish communal plantations of food plants in lieu of paying a tax in money, and they do this under European instructors. The expenditure for 1926 was £157,202 and the revenue £172,395; both are increasing fast, especially the latter. The ports are Port Moresby, Samarai, Kulumadai, Daru and the imports are worth nearly £500,000, the exports nearly £700,000; the latter are rising very rapidly. Copper has been worked for some time near Port Moresby and the export of this in 1926 was worth £155,305 while rubber amounted to £194,849 and copra to £204,097. (A. C. H.)

Mandated Territory of New Guinea.—The northern section of south-east New Guinea (formerly called Kaiser Wilhelmsland) was mandated in 1919 by the League of Nations to the Government of the Commonwealth of Australia, together with the Bismarck archipelago (New Britain, New Ireland, and adjacent islands), the Admiralty islands and several outlying groups, and the northern Solomon islands (Bougainville and Buka). North-eastern New Guinea lies between 2° 15' and 8° S., and 141° 30' and 148° E. It had been declared a German protectorate in 1884 when not a single white man lived there. Plantations arose in the islands and on the mainland, and three German mission societies soon formed settlements in New Guinea. There are now eight mission societies working in 603 stations in 18 districts. Under the mandate, the system of indirect rule through native chiefs has been continued. The administrator advises the governor-general of Australia who can legislate by ordinance. There are ten district officers,* six of whom are in the islands. The headquarters is at Rabaul. No slavery or forced labour is permitted, but natives are not allowed to leave the territory, and labour indentures are made. No one may supply natives with firearms, ammunition, alcoholic liquor, opium or derivatives of opium. A native police force has 464 constables and 42 N.C.O.s.

The total native population is estimated at 378,701, excluding territories not yet under control and also excluding 23,421 inden-

tured labourers. Of the above population 187,011 are on the mainland. The non-native elements number 3,045 including 1,303 Chinese, 944 British and 310 Germans. The area of the mainland mandated territory is 68,500 square miles. The area under cultivation includes 113,481 ac. of coconuts, often with cacao between the trees, and 2,478 ac. of rubber under the control of the Expropriation Board. Independently managed are 55,490 ac. of coconuts and small plantations of rubber, cotton and cacao. The exports for 1925 were valued at £858,990, the imports at £537,940.

Dutch New Guinea.—Dutch New Guinea, which lies between 10° S. and the equator, comprises practically half of the entire island of New Guinea. The boundary line between it and British New Guinea starts from the south coast and follows the line 141° E. up to the Fly river, which river then forms the boundary until 141° E., is reached, when the meridian becomes the boundary again, right up to the north coast. The area is 151,789 sq.m., and the population is estimated at 195,460, of whom 237 are Europeans or Eurasians. The territory is practically undeveloped, save for the extreme western coastal portion opposite Ceram, and parts of the northern coast, its coasts are imperfectly charted, and there has been little systematic exploration. The northern half is mainly hilly, with a very high range of mountains traversing it east by west, though along the northern coast and on either side of the Mamberamo river, which flows into the sea at Cape d'Urville, are great alluvial tracts of land; the extreme west is almost wholly hilly; the south very flat, with vast swamps near the coast, especially in the south-west, where Prince Frederick Henry island, separated from the mainland by the narrow and tortuous Princess Marianne strait, is perfectly flat and marshy, and covered with dense forest. Into McCluer gulf, which divides the western portion of Dutch New Guinea almost into two, flow several rivers, including the Seljar and Katero, the former navigable, for small vessels, for 34 and the latter for 23 miles. Along the south-western coast stretch, in succession, from north to south, the Mimika, Utakwa, North-West river, Lorentz, Utumbuwe, Eilanden, Digul and Merauke. Some of these are situated so close to each other that they are connected by channels navigable for small, light-draught boats, several are navigable for distances of from 25 to 50 m. for steamers of 12 ft. draught, and the Digul the largest, is 6 m. wide at its mouth and has been ascended for nearly 400 m. by a steamer of 6 ft. draught. The south-western coast is flat and fairly even, until the Charles Louis Mts. are reached, where it becomes high and much indented, Nautilus strait running far inland, between hills. Flat tracts alternate with high ground along the western coast, very much indented after McCluer Gulf, and the north coast, from Cape Sorong along Little Geelvink bay, to the middle of the coastline of Great Geelvink bay, is generally high, especially where, near Manokwari, the Arfak Mts. come very near to the sea. The remaining shores of Geelvink bay, to Cape d'Urville, and beyond, as far as Sarmi point, are low, flat and alluvial, but from here to Humboldt bay it is mostly high, rugged and rocky. The entrance to Great Geelvink bay is blocked by several islands, the northernmost being the Schouten group, Suk, or Supiori, to the west, and Biak, or Wiak, to the east. The former is 17 m. long and has hills reaching 1,600 ft.; the latter is 45 m. long and 23 m. wide, with a hill 800 ft. high at the southern end, otherwise it is only 50 ft., above sea-level. Farther within the bay is the important island of Jobi, or Jappen, 110 m. long and 15 wide, with a ridge of mountains 2,500 ft. high running along the centre, the south coast being indented with deep creeks, fronted by wooded islets and reefs. Between Ceram and the north-west coast of Dutch New Guinea lies Misol, 50 m. long and 23 broad (narrow in the west, wide in the east), with numbers of very small islands to the north and south of it. It is flat in the north and hilly in the south, no point being over 1,800 ft., the coast is rocky, but swampy in places, and there are three rivers, navigable for a few miles. Separated from the north-west coast by the narrow Galewo straits is Salwatti, a round island, 30 m. across, with regular coasts, and limestone hills on the north coast, 1,000 ft. high, but low and swampy in the east, and no rivers of note: east of Salwatti is the small island of Popa. North of Salwatti, separated by Pitt strait, is Batanta, 40 m. long and only

from 4 to 8 m. wide, densely wooded and mountainous (highest point 3,676 ft.). Due north of Batanta is the large island of Waigiou, 28 m. wide, nearly 80 in length, and separated from New Guinea by Dampier strait, 30 m. in width. It is covered with dense forest.

Commerce and industry in Dutch New Guinea are almost unknown. The people generally live in a very wild state, head-hunting and cannibalism are all too prevalent; some are semi-nomadic, others entirely, and as they live largely on sago, and this is obtainable almost everywhere, in large quantities, with a minimum amount of labour, whilst the coconut abounds, and the sweet potato, sugar-cane, plaintain, papaya and tobacco are grown with little trouble, there is no incentive to work, apart from hunting the cassowary, pig and kangaroo, for their flesh, and fishing, the only lucrative employments followed being those of hunting the bird of paradise, collecting the wild nutmeg, the mace of which is much esteemed and marketed specially in Macassar, and the preparation of copra. Men and women go about almost entirely naked, the men armed with bow and arrow, axes of polished stone, and daggers of the jaw-bone of a crocodile or the thigh-bone of a cassowary. There are head men of villages, but they have little power, the people of the coast are often at war with those of the scrub lands of the interior, and there is enmity between these and the mountain folk: language varies considerably. There are no roads, save in the immediate neighbourhood of Dutch official settlements.

In the whole of South New Guinea there is only one settlement, Merauke, a few miles inland up the Merauke river. A Dutch *Gezaghebber* resides here, there is a small garrison, a hospital, Catholic mission church, and settlement, and a few shops, mostly run by Chinese traders, a wireless station, and a small wharf, where vessels of the Dutch Royal Packet Company land passengers and collect copra and other cargo. Merauke was established in 1902, as the result of a military expedition. The nearest Dutch settlement to Merauke is at Kaimana, on the McCluer gulf, 500 m. distant. Here, and at Kokas and Fak Fak (headquarters for West New Guinea, where there is a *Gezaghebber*), there are small trading stations with Malay, Chinese and Arab settlers; Fak Fak is the most important, where proximity to Ceram and generations of outside influence have resulted in settled and semi-civilized conditions amongst some of the Papuans. All three places are ports of call for vessels of the Dutch Royal Packet Company, also Sorong, on the north-west coast, opposite Salwatti, and Manokwari (Doreh), on the north-east coast, which is the seat of an assistant resident and the headquarters of administration for North New Guinea. Wasior, on Little Geelvink bay, is another port of call, also Sarmi, Demta and Humboldts bay, and here, too, are Chinese and Malay traders, dealing mostly in copra and bird of paradise plumes, and there is some exploitation of the hinterland. The development of Dutch New Guinea will probably be more rapid than that of North New Guinea, for there is good land available and more chance of being able to utilize imported labour, when this can be procured. Trade is being developed with Jappen island, where Dutch Royal Packet vessels call at two ports, Seroei and Wooibaai; and with Biak, of the Schouten islands, the port of which is Bosnik.

A treaty dated 1660 between the Dutch East India Company and the three States of Ternate, Tidore and Bachian, acknowledged the company to be "lord of the Papuans or all their islands which are subject to the king of Tidore." This gave the Dutch a nominal sovereignty over the Tidorese fiefs on the islands of Waigiou, Salwatti and Misol, and as on the latter two islands there were kingdoms possessing a vague sovereignty over parts of the mainland of New Guinea, whilst the suzerainty of Tidore was acknowledged in the neighbourhood of McCluer gulf, eventually the Dutch succeeded to these somewhat shadowy rights. Their first establishment was in 1828, when Fort de Bus was erected, but before this, in 1814, Dutch sovereignty in North-West New Guinea had been admitted, practically, by Great Britain by the convention of 1814, which restored to the Dutch their colonies as they had existed prior to 1803. In 1828 the Dutch Government declared North-West New Guinea, as a de-

pendency of Tidore, a part of the Dutch East Indian colonies, which claim was confirmed in 1848, the frontier then being stated to run straight from Cape Bonpland to the north coast. In 1884, when South-East New Guinea was declared a British Protectorate, the meridian of 141° E. was acknowledged as the frontier between British and Dutch territory, and later, in 1885, the same meridian was accepted by the Dutch as defining the frontier of German New Guinea. A convention entered into by Holland and Great Britain in 1895 made a slight alteration in the boundary (the Fly river) and made the navigation of the Fly river free to subjects of both Powers, except for the carriage of munitions of war. In 1898 Tidorese territory was assigned to the Ternate Residency, in 1911 West New Guinea was attached to the Residency of Amboyna (the chiefs having subscribed to the "short declaration" in 1909), and the present division of territory is North New Guinea, West New Guinea, and South-West New Guinea, the former province being under Ternate, the two latter under Amboyna. (E. E. L.)

ANTHROPOLOGY

The island of New Guinea and its island-clusters, together with those adjacent island-groups, of which the principal are the Louisiades and the Torres Straits Islands, is a region of considerable racial and cultural diversity. The territory of New Guinea, the north-eastern quarter of the island, is, however, still very incompletely surveyed ethnologically, and of the inhabitants of Dutch New Guinea, our knowledge is comparatively slight.

Racial History.—Although there is considerable variety of racial type, the inhabitants of New Guinea belong almost entirely to the ulotrichous (frizzy-haired) branch of mankind. The principal varieties are the Negritos, the Papuans and the Melanesians. The only typical Negritos that have been found in New Guinea are the Tapiro at the source of the Mimika river in the Snow mountains of Dutch New Guinea, and the Pesechem. The Mafulu, the Kai and some others have probably a Negrito element.

The Papuan, the dominant stock in New Guinea, is dark, of short stature and generally long-headed. Evidently, Papuan man occupied not only New Guinea, but also Melanesia in very early times (see OCEANIA; *Racial History*), later migrations from Indonesia having on the whole less racial than cultural effects. The Melanesian element in New Guinea is certainly comparatively recent, and appears to be a mixture of Papuan with Indonesian and proto-Malay, a mixture which may in part have taken place in Indonesia. The Melanesian influence is strongest in the north and north-eastern coastal regions; and on the south-east coast of Papua the immigrant nature of this Melanesian type is clear.

Principal Groups.—Taking the whole New Guinea area, and

working from west to east, some of the principal culture-areas (or tribes where these exist) may be enumerated. Belonging to New Guinea rather than Australia we have the islands of Torres Straits with a well-developed and distinctive culture. Two groups on the mainland between the Fly and the Dutch boundary may be mentioned, the Tugeri, partly in British but mainly in Dutch territory where they are known as Marind-Anim (their name for themselves) and the Kiwais. A culture of which little is known occurs in the neighbourhood of Lake Murray, between the Strickland and the Fly; and between the Fly and the Aramia, we have a tribe, the Gogodara, containing many distinctive characters. In the Gulf of Papua, from a little west of the Kikori river to Cape Possession, four main groups are distinguished by Dr. Haddon, Kerewa, Urama, Namau and Elema, and far from the coast on the upper waters of the St. Joseph river the Mafulu show distinctive characters, physically and culturally. To the east of these Papuan districts we meet the farthest westward extension of Melanesian-speaking peoples. There are two main groups of these Papuo-Melanesians, the Western Papuo-Melanesians, the Roro, Mekeo, Motu and others, and the eastern Papuo-Melanesians or Massim, inhabiting the eastern extremity of New Guinea and the islands beyond, including the whole of the Louisiades, except possibly the island of Rossel, the inhabitants of which speak a non-Melanesian language. Passing westward along the north coast, Melanesian-speaking peoples give way for a while to Papuan-speaking peoples, such as the Orokaiva.

In the territory of New Guinea (excluding the Bismarck Archipelago, *q.v.*), the Bukaua, Huon gulf and the adjoining Jabim are Melanesian in culture, while the Tami of the neighbouring islands seem to be fairly pure Melanesian. Farther north the Kai, who inhabit the Rawlinson and Sattelberg ranges, are Papuan with Pygmy admixture. Both Papuan-speaking and Melanesian-speaking peoples occur along the coast farther north and west. Flourishing cultures occur on the Sepik river, and something is known of the Banaro on the Keran river.

In Dutch New Guinea something is known of the Geelwink bay district, where Melanesian-speaking peoples occur. On the west coast we find Papuans on the Mimika river, and at the headwaters of this river are the Tapiro pygmies.

Mode of Life.—With very few exceptions the inhabitants of New Guinea are horticulturists, cultivating coconuts, yams, taro, bananas and a number of other food plants. Sago is also an important food in some parts, constituting the main article of diet in the swampy region of western Papua. Fish are caught by net and spear, and occasionally by hook; and the harpooning of the dugong is an important feature amongst certain of the coastal peoples. The pig, domesticated and wild, is the only important flesh-food, though the wallaby and many birds are caught by various devices. Betel-nut is chewed with lime and pepper-plant, and the use of tobacco is now universal. Kava, the Polynesian drug, is limited to one or two places. Family houses are usually small, and are often built on piles. They may be scattered, as amongst the Massim, or grouped in big villages, as amongst the Motu and Gulf peoples. Club-houses in which initiated males live most of their lives occur in many parts and may be of considerable size; structures of this kind which entail enormous labour occur on the Sepik and in the Papuan gulf. Canoes are simple dugouts, or provided with an outrigger. Double canoes occur amongst the western Papuo-Melanesians. The Motu, joining several canoes together, make vessels of considerable size. For clothing the men usually wear some sort of girdle, and the women a petticoat of shredded palm; the Papuans of the north-west coast of Papua clothe the waist with tapa-cloth. Armlets of cane or of shell are common; necklaces of shell, dogs' teeth or seeds. The septum of the nose is commonly pierced to admit a nose-stick, usually of clam-shell, and the lobes of the ear are pierced and decorated in the east with turtle-shell rings and sapi-sapi beads. Tattooing has an irregular distribution, being confined to women in the case of the Massim, who are tattooed from forehead to thighs. Considerable artistic skill is shown, particularly by the Melanesian-speaking inhabitants, the carved and fretted woodwork of the Massim being of unusual excellence. Pottery is in general use among the Mel-

anesian-speaking peoples. The drum is the commonest musical instrument, though absent from Rossel island in the Louisiades. Slit wooden gongs, with a most limited distribution, are found north of Huon gulf, in the territory of New Guinea, and in Dutch New Guinea. With these gongs are associated sacred flutes, which, however, are also found in the northern division of Papua.

Social Organization.—Although the family (*q.v.*) is an important unit in the social structure of all New Guinea peoples, a wider group, the clan (*q.v.*), seems in general to be more fundamental. Moreover, family relationships are not usually distinguished by name from many more remote relationships, and relationship terms used between persons who can trace genealogical relationship are also used in a systematic way between persons who are unable to trace any genealogical connection. This system, known as the classificatory system, takes a variety of forms in New Guinea, and social organization is unintelligible without an understanding of this system. Within the clan the classificatory system establishes a comparatively small number of relationships, and in general members of the same generation within a clan address one another as brothers and sisters, and the tie uniting members of one clan will be found to be similar to that uniting brothers and sisters by one father or mother. Both matrilineal clans (membership of which is determined by descent through the mother), and patrilineal clans (membership of which is determined by descent through the father), are found in New Guinea. The principal matrilineal area is the Massim district of Papua, and in this area the clans are totemic. (*See TOTEMISM.*) Each clan is associated with four linked totems, bird, plant, fish and snake, and the bird-totem is not eaten by members of the clan. A person will also avoid the bird-totem of his father's clan, the totems of which are necessarily different, since the rule of clan-exogamy (marrying out of the clan) is strictly observed. Amongst the patrilineal Papuans of the west, the clan seems to become of rather less importance, and totemism occurs only in an attenuated form in the Gulf region.

In the east the clan figures as the important unit in the rituals of marriage and death, and the series of feasts more or less connected with these events, which play a dominant part in the life of the Massim. Reciprocal exchanges of pigs and objects of value between persons more or less representative of clans is an important part of all such activities, as in the Big Feast which extends from the Massim as far as the Mafulu. This reciprocity between clans was also shown in warfare, cannibalism being a ceremonial act of revenge on the part of one clan for the death of one of its members by another clan.

In the social organization of the Papuans of the west, as well as the Papuans of the northern division, and the Jabim, Bukaua, Tami islanders and others in the territory of New Guinea, the outstanding feature is the existence of tribal initiation-ceremonies. The Elema tribes commence this initiation of the males at about the age of eight, when the boy is first taken into the club-house of the village and shown the bullroarer, the noise of which has previously been a mystery to him. Only after two or three years is his initiation complete, and the process involves not only various ordeals and instruction for the initiates, but a great deal of ceremonial in which the whole of the village, and maybe other villages, are involved. In other initiation rites the swallowing of novices by a monster and subsequent resurrection is prominent, this occurring both amongst the extreme western tribes of Papua and in the Huon peninsular district of the territory of New Guinea.

Religion.—A cult of the dead occurs throughout New Guinea, and only rarely is a cult of gods associated with it. The Big Feast of eastern Papua is to a large extent a collective celebration of the dead, though in the Soi feast of the Massim a being is continually addressed, who is not strictly an ancestor, and is supposed to have performed supernatural feats in olden times, and to have introduced the pig into New Guinea. This being is related to a number of other superhuman beings who lived in the past, but they can hardly be regarded as objects of a religious cult. On Rossel island, on the other hand, at the extreme east of the Massim area, we find an elaborate god-cult and constant care of the gods, who control the processes of nature by a priesthood.

The religion of the Elema tribes in the west of Papua may be described as an ancestor-cult, the name for ancestor being the same as that for all sacred objects; but some of these ancestors are regarded as deities who temporarily assumed a human form, giving birth to various tribes.

That death results from sorcery or is brought about by ghosts is probably a universal belief in New Guinea. The magic employed by sorcerers for this end is usually of the sympathetic type, some part of the victim being utilized by the sorcerer, or some imitative action being made to the accompaniment of a spell. Divination is also common, and where it is believed that ghosts may cause sickness divination is used to discover whether a ghost or sorcerer is responsible. On Rossel island an alternative cause of death is the desecration of the sacred ground of a god. (W. E. A.)

HISTORY

Exploration.—Although New Guinea may have been seen by Antonio d'Abreu in 1511, its first visitor was apparently Dom Jorge de Meneses, who in 1526 took shelter at "Isla de Versija," either Warsia on the north coast, or Waigiu Island. Two years later Alvaro de Saavedra discovered "Isla de Oro," probably one of the Schouten Islands, and sailed along the north coast. The name "Nova Guinea" is due to Ynigo Ortiz de Retez (or Rotha) who landed on the north coast in 1546, and thought the natives resembled those of West Africa. The chart of Ortelius (1580) shows "Nova Guinea" as an island seventeen years before the fact was proved by Luis Vas de Torres sailing through the straits now bearing his name.

Dutch navigators, Willem Jansz (1605), Jacques le Maire and Willem Schouten (1616), Jan Carstensen (1623), Gerrit Pool (1636), Abel Tasman and others, appeared after the conquest of the Moluccas. In 1700 William Dampier sailed along the northern coast, and Philip Carteret (1767) and L. A. de Bougainville explored the islands. James Cook re-discovered Torres Straits, and landed in New Guinea near Prince Frederick Henry Island (1770). Thomas Forrest (1774) wrote an interesting account of the island (*Voyage*, 1780). Although parts of the coast were surveyed by La Perouse (1788), John MacCluer (1790), D'Entrecasteaux (1793, *Voyage* by Rossel), and also by Duperrey (1823), D. H. Kolff (1826), and Dumont d'Urville (1828), very little knowledge was gained of the country or people.

The Papuan Gulf and shores eastward were visited by F. P. Blackwood (1842-6, *Voyage of the Fly*, by J. B. Jukes), Owen Stanley (1846-50, *Voyage of the Rattlesnake*, by J. Macgillivray), Charles B. Yule (1864) and J. Moresby (1874). In 1875 Schleinitz explored the north coast and islands. During this period scientific observers visited the islands, notably A. R. Wallace (1858), Odoardo Beccari (1871-76), Maria d'Albertis (1871-78), C. B. H. Rosenberg (1869-70, *Bijdragen*, 1875), and Nicholas von Miklucho-Maclay (1871-81). Expeditions were made for the Netherlands India Government by P. van der Crab, E. Teyssmann, J. G. Coorengel, A. J. Langeveldt van Hemert and P. Swaan

(*Bijdragen*, 1879). Missionaries of the Utrecht Missionary Society were at Port Dorey in 1858, and English missionaries have resided in the south-east since 1871. Of these, Samuel Macfarlane (1875), James Chalmers (1877-1901), and George Brown (1875-1897) have described both country and people. Otto Finsch (1882), and Theodore Bevan (1884-87) explored the southern rivers.

Since the annexations, explorers and observers have been constantly at work. During and since the administration of Sir William MacGregor (1888-98), large areas of British territory were surveyed, and the natives pacified by a system of patrols (*Annual Reports*). The island was first crossed in 1897. James Chalmers was murdered in 1901. The anthropology has been made known by C. G. Seligman, V. M. Egidio, W. Merish Strong, R. W. Williamson, B. Malinowski, W. J. Saville, E. B. Riley, G. Landtman, J. H. Holmes, A. C. Haddon and others. In 1922 Leo Austen ascended the Fly River to the Netherlands Boundary.

In German territory the Sepik (Kaiserin Augusta) river was visited by Otto Finsch (1885) and the Ramu river by Schleinitz (1887). In 1893 O. Ehlers and N. Piering lost their lives in crossing the island from Huon Gulf. Other explorations were carried out by C. Lauterbach (1896), Poch (1904), Heine (1908), Full and Friederici (1908).

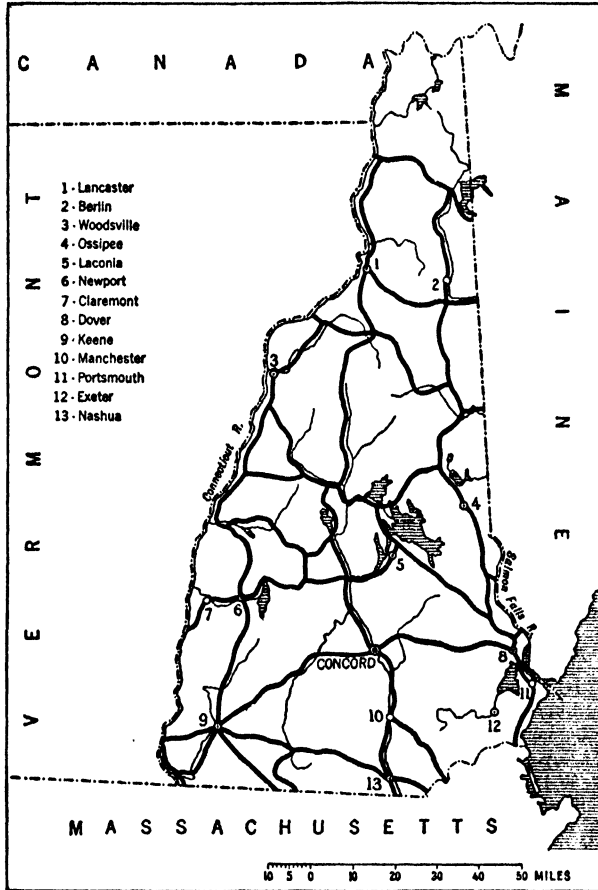

The northern part of Netherlands territory was explored by C. E. A. Wichman, G. A. J. van de Sande, and H. A. Lorentz (1903) and the south by Lorentz (1909—*Nova Guinea* by A. Wichman). South-west New Guinea has been explored (*Netherlands Geographical Society* 1908) and Central New Guinea in 1920 (H. J. T. Bijlers, 1923).

Annexations.—In 1793 New Guinea was annexed by the (English) East India Company, who placed a garrison for some time on Manuswari Island in Geelvink Bay. As Suzerain of the Sultan of Tidore the Dutch (after 1848), claimed control over the northern coast as far as Humboldt Bay. In 1828 they established a fort in Triton Bay and took possession of the south-west coast as far as the 141st meridian. Their claim to the western half of the island was admitted by Britain and Germany in 1885. In 1905 the Sultan of Tidore ceded his rights to the Government.

In 1864 Yule annexed the south coast for the British crown, and Moresby in 1873 took possession of the islands of Eastern New Guinea. The possible dangers to the commerce of Queensland and Australia generally, should the island come into the possession of a foreign power, led to a demand for annexation. The Germans in 1882 having advised their Government to annex, the Queensland Government in 1883 actually annexed all the mainland opposite their shores and east of the 141st meridian, but, as with the annexations of Yule and Moresby, this action was disavowed by the Home Government. In 1884 Germany annexed the north-east coast and adjacent islands, and Commodore Erskine proclaimed a British Protectorate over the region east of the 141st meridian as far as East Cape and the islands to Kosmann Island. In 1885 the German New Guinea Company was chartered to acquire and occupy those portions of the island not under British or Dutch sovereignty, the mainland being styled Kaiser Wilhelmsland, and the islands the Bismarck Archipel. A boundary agreement was made in the same year, the British territory being named British New Guinea. In 1888 the Protectorate became a dependency controlled by Queensland and in 1906 was renamed the Territory of Papua. In 1889 the German New Guinea Company surrendered their charter and the Imperial Government assumed direct administration. After the capitulations in 1914, the German territory was occupied by an Australian administration. Now, as the Territory of New Guinea, it is held by Australia under Mandate from the League of Nations.

BIBLIOGRAPHY.—Accounts of voyages published under the explorers' names are not noted here. A few others are mentioned in the text. Many Dutch expeditions are described in the *Bijdragen tot de taalkunde en volkenkunde van Nederl. Indië*, especially for 1875 and 1879. German explorations are recorded in *Nachrichten über Kaiser Wilhelmsland*. English surveys will be found in *Annual Reports on British New Guinea (and Papua)*. Others works are: A. Dalrymple, *Historical Collection* (1770-71); Burney, *Chronological History* (1803); Meyners d'Estree, *La Papouasie* (Paris, 1881).

NEW HAMPSHIRE, popularly known as the "Granite State," is one of the New England group of the United States of America and one of the original thirteen. The State lies between $42^{\circ} 40'$ and $45^{\circ} 18' 23''$ N., and between $70^{\circ} 37'$ and $72^{\circ} 37'$ W. It is bounded north by the Canadian province of Quebec; east by Maine, by the Salmon Falls river, which separates it in part from Maine and by the Atlantic ocean; south-east and south

MAP SHOWING THE MAIN ROADS IN NEW HAMPSHIRE

by Massachusetts; west and north-west by Vermont (from which it is separated by the Connecticut river—low water mark on the west bank of the Connecticut is New Hampshire's west boundary), and by Halls Stream which separates it from Quebec. The State has an area of 9,341 sq.m., of which 310 sq.m. are water surface.

Physical Features.—In the north central portion of the State, the White mountains, a continuation of the Appalachian system, rise abruptly in several short ranges and in outlying mountain masses from a base level of 700 to 1,500 ft. The highest, Mount Washington, attains an elevation of 6,293 feet. The principal ranges, the Presidential, the Franconia and the Carter-Moriah, have a north-eastern and south-western trend. The Presidential, in the north-eastern part of the region, is separated from the Franconia on the south-west by the Crawford or White Mountain Notch, about 2,000 ft. in depth, in which the Ammonoosuc and Saco rivers find a passage, and from the Carter-Moriah, parallel to it on the east, by the Glen-Ellis and Peabody rivers, the former noted for its beautiful falls. On the Presidential range, which is about 20 m. in length, are Mount Washington and nine other peaks exceeding 5,000 ft. in height. On the Franconia, a much shorter range, are Mount Lafayette, 5,269 ft.; Mount Lincoln, 5,098 ft.; and four others exceeding 4,000 feet. The highest peak on the Carter-Moriah range is Carter Dome, 4,860 ft.; but seven others exceed 4,000 feet. Separating Franconia and Pemigewasset ranges is the romantic Franconia Notch, overlooking which from

the upper cliffs of Profile mountain is The Great Stone Face, immortalized by Nathaniel Hawthorne.

The part of the State which lies north of the White mountains is occupied by ridges and wide rolling valleys, the ridges rising occasionally to heights of 2,000 ft. or more. South of the mountains a plateau-like surface—a part of the New England uplands—extends from the intervalles of the Connecticut river to the eastern border of the Merrimac valley. Between the Merrimac valley and the sea is the only low surface in the State; a considerable portion of this region is less than 500 ft. above the sea. The seashore, about 18 m. in length, is mainly a low sandy beach. The only harbour is at Portsmouth near the mouth of the Piscataqua. About 9 m. from the shore are the bleak and nearly barren Isles of Shoals, divided between New Hampshire and Maine.

The lakes and ponds, numbering several hundred, were formed by glacial action and the scenery of many of them is scarcely less attractive than that of the mountains. The largest and most widely known is Lake Winnepesaukee, 20 m. long and from 1 to 8 m. wide is dotted by 274 islands, mostly verdant, and has clear water and a rather level shore, behind which hills or mountains rise on all sides. The rivers with their numerous falls and the lakes with their high altitudes furnish a vast amount of water-power for manufacturing,—the Merrimac, in particular, into which many of the larger lakes, including Winnepesaukee, find an outlet.

Fertile soil in New Hampshire is confined largely to the bottomlands of the Merrimac and Connecticut rivers. In the south-eastern section is also a moderately productive soil derived largely from the disintegration of slate. Elsewhere south of the mountains, the surface soil is mostly *hard pan* or *till*, this being deepest on the drumlins. In the mountain region the soil is mostly a sandy loam composed of disintegrated granite gneiss and organic matter; on the lower and more gentle slopes as well as in the valleys this is generally deep enough for a luxuriant vegetable growth but on the steeper slopes it is thin or the rocks are bare.

Climate.—The winters are usually long and severe, and the summers cool and fine. The mean annual temperature ranges from about 42° at only moderate elevations in the White mountain region and farther north to 47° at low altitudes in the south-east. The greatest extremes of temperature occur in the deep mountain valleys where it sometimes rises to 102° or above, in summer, and falls to -38° or below in winter; higher up on the mountains it is never so warm and along the sea-coast both extremes are considerably less. The mean precipitation for the entire State is about 40 inches. The distribution is even throughout the year, but summer and autumn are slightly more wet than winter and spring. Among the mountains and in the northern part of the State the annual fall of snow is from 7 to 8 ft., but in the south-east corner it is little more than one-half that amount. The prevailing winds

GRAPH SHOWING GROWTH OF POPULATION OF NEW HAMPSHIRE, 1790-1920

are generally north-west, but in the vicinity of the sea they are south-east during summer.

Population.—The population of New Hampshire on July 1, 1927 was 455,000, as estimated by the U.S. census bureau. The population of the State at certain of the decennial censuses was as follows: 141,885 (1790); 183,858 (1800); 269,328 (1830); 326,073 (1860); 376,530 (1890); 411,588 (1900); 430,572 (1910); and 443,083 (1920); the percentage of increase was 4.6 from 1900 to 1910 and 2.9 from 1910 to 1920. New Hampshire, in population, then ranked 41st among the States of the Union.

Of the total in 1920, 20.6% were foreign-born, 18.3% were of foreign-born parentage, 10.1% were of mixed parentage, and 51% were of native parentage. Of the total foreign-born population (91,233), 52,274 or 57.2% were natives of Canada (38,277 French and 13,997 others); 7,908 of Ireland; 5,280 of Greece; 4,367 of England; 3,997 of Poland; 3,467 of Russia; and 2,074 of Italy. The density of population in 1920 was 49.1 per square mile. The population of the principal cities was estimated in 1925 as follows: Berlin, 18,552; Concord, the capital, 22,546; Dover, 13,029 (1920 population); Keene, 11,855; Laconia, 11,300; Manchester, 83,097; Nashua, 29,723; and Portsmouth, 14,871.

Government.—New Hampshire was the first of the original States to establish a Government wholly independent of Great Britain. This was designed to be only temporary, but was in operation from Jan. 5, 1776 to June 2, 1784. The constitution provided for a general court consisting of a senate and a house of representatives and made the council a body advisory to the State president; the 1784 instrument was amended in 1792; with the amendments adopted in that year it is in large measure the Constitution of to-day. For 60 years there was no change whatever, and only three amendments, those of 1852 (removing the property qualifications of representatives, senators and the governor), were adopted until 1877, when 12 amendments were adopted,—the most important being those providing for biennial (instead of annual) State elections in November (instead of March), and those doing away with the previous requirement that representatives, senators and the governor "be of the Protestant religion." Five amendments were ratified in 1880, four in 1902 and four in 1912. The most important of those adopted in 1912 was one providing for the election of the governor and members of the council by a plurality instead of a majority vote. New Hampshire is the only State in which amendments to the Constitution may be proposed only by a Constitutional convention, and once in seven years at the general election a popular vote is taken on the necessity of a revision of the Constitution. By an act approved on April 9, 1909 provision was made for direct nominations of candidates at primaries.

There is a governor's council of five members, one from each councillor district, which has advisory duties and shares with the governor most of his powers. There is no lieutenant-governor. The governor and the councillors are elected for a term of two years. The governor and the council appoint all judicial officers, the attorney-general, auditor, important administrative boards, coroners and certain naval and military officers; they have power to pardon offences; and they may exercise some control over expenditure through the Constitutional requirement of the governor's warrant for drawing money from the treasury. The governor may veto within five days, besides Sunday, after it has been presented to him, any bill or resolution of which he disapproves, and a two-thirds vote of the members of both houses is required to pass over his veto. A senate and a house of representatives, which together constitute the general court, meet at Concord on the first Wednesday in January of every odd-numbered year, and at such other times as the governor may appoint for a special session, principally for the making of laws and for the election of the secretary of State, the State treasurer, and the commissary general. The senate is composed of 24 members, one from each senatorial district. In the house of representatives, which had the larger membership of 421 (1924), representation is on the basis of population, but favours the rural districts. Senators and representatives are elected for a term of two years. Although money bills may originate only in the house of representatives the senate may propose amendments.

For the administration of justice the State has a supreme court and a superior court, each county has a probate court, and some towns as well as the cities have a municipal court. The supreme court consists of a chief justice and four associate justices; the superior court, of a chief justice and five associate justices. The supreme court holds one general term each year at Concord and on the first Tuesday of every month except July and August sits to hear arguments, make orders and render decisions; the superior court holds one or two sessions a year in every county. Both of

these courts have extensive jurisdiction. Each probate court, consisting of a single judge, has jurisdiction within its county of the probate of wills, of the granting of administration, in insolvency proceedings, in relation to the adoption of children, and other similar judicial functions. The court of a justice of the peace has jurisdiction in criminal cases only where the punishment is by fine not exceeding \$20, or by imprisonment not exceeding six months or by both, and in minor civil cases. A municipal court has the same jurisdiction as that of a justice of the peace, and, in addition, concurrent jurisdiction with the superior court in certain cases where the title to real estate is not involved and the damage demanded does not exceed \$100. Justices of the peace are appointed for a term of 5 years only, but they may be reappointed. Local affairs are administered by counties (ten in number), towns (townships), village districts and cities. In each county a convention, composed of representatives from the towns, meets every two years to levy taxes and to authorize expenditures for grounds and buildings whenever more than \$1,000 are required. For the discharge of other county functions the qualified electors of each county elect every two years three commissioners, a sheriff, a solicitor, a treasurer, a register of deeds and a register of probate; two auditors also are appointed annually by the supreme court. The county commissioners have the care of all county property, as well as of county paupers; and once every four years they are required to visit each town of their county, inspect the taxable property therein, determine whether it is incorrectly assessed and report to the State board of equalization. In each town a regular annual meeting of the qualified electors is called on the second Tuesday in March for the transaction of miscellaneous business and the election of town officers.

Finances.—The total valuation of property for the purposes of taxation in 1926 was \$673,250,335; the State levy \$3,064,587 or \$6.77 per caput. The chief sources of the income of the State for the year ending June 30, 1926 were the general property tax, motor vehicle licence fees, the gasoline (petrol) tax, railroad taxes, interest from sinking fund securities, legacy taxes, tax on foreign insurance companies and a tax on telephone companies. The principal disbursements were for highways (\$2,651,215), refunds to towns (\$1,507,437), public schools (\$1,308,029), State institutions (\$1,155,895), sinking fund (\$800,566) and the University of New Hampshire (\$545,575). The total receipts and disbursements for the year ending June 30, 1926 were \$9,451,378.58 and \$10,434,506.69, respectively. The cash and cash items on hand July 1, 1926 was \$939,796 as compared with \$1,922,924 a year before.

Education.—New Hampshire formed a part of Massachusetts when, in 1647, the general court of that province passed the famous act requiring every town in which there were 50 householders to maintain a school for teaching reading and writing, and every town in which there were 100 householders to maintain a grammar school. During the 19th and early part of the 20th century various experiments for improving the public school system were tried. The public school system, as now constituted, has at its head a State board of education composed of the governor and five other persons, one selected annually, appointed by the governor and council. The actual administrative work is carried on by a commissioner of education, appointed by the board of education for an indefinite term, and two deputy commissioners. Each town is constituted a school district, and some special districts are organized under special acts of the legislature. For the purpose of inspecting and supervising all institutions in which State money is spent, the several school districts in the State are combined into supervision unions consisting of one or more school districts. The schools are maintained chiefly out of the proceeds of a district school tax, which must not be less than \$3.50 on each \$1,000 of assessed property. To this is added a "Literary Fund" (designed originally for founding a college) from various sources. All children between the ages of 8 and 16 are required to attend either a public or an approved private school for the full term unless they are more than 14 years old and have completed the studies prescribed for the elementary schools, or have been excused by the school board on account of physical or

mental infirmity. The school enrolment, for the year ending June 30, 1926 showed 74,735 attending public schools and 26,231 attending parochial and private schools. Of the total public school enrolment 59,671 were in the elementary grades, 12,114 in high schools and 2,950 in evening schools. The one-room schools of the State had an attendance of 12,039 pupils. The total expended on public education in 1926 was \$7,933,669.

The only State institutions of higher education are the Plymouth Normal school (1870) at Plymouth, the Keene Normal school

TABLE SHOWING DECREASE IN AMOUNT OF LAND IN FARMS, 1900-1925

(1909) at Keene, and the University of New Hampshire, organized as a department of Dartmouth college in 1866, but reorganized as the New Hampshire College of Agriculture and Mechanical Arts and removed to Durham as a separate institution in 1891. It was given its present name in 1923 by an act of the legislature. Other institutions of higher learning in the State are Dartmouth college (non-sectarian, 1769), at Hanover, and Saint Anselm's college (Roman Catholic, 1893), at Manchester.

Charities and Corrections.—The State charitable and correctional institutions include the New Hampshire School for feeble-minded children, at Laconia; the New Hampshire Soldiers' Home, at Tilton; the New Hampshire Industrial School, at Manchester; the New Hampshire Hospital for the Insane, and the State prison, at Concord; and the New Hampshire sanatorium for tuberculars, at Glenciff in the town of Warren. The State also makes annual appropriations for the care and education of blind and deaf and dumb persons in institutions outside of the State. Each county has an almshouse and house of correction.

Agriculture.—Agriculture on the farms of New Hampshire still working has been greatly modified, the production of vegetables, fruits, dairy products, poultry and eggs largely supplanting the production of cereals. The total acreage in farms decreased from 3,249,458 in 1910 to 2,262,064 in 1925. The farm acreage was then 39.1% of the total land area. During the same period the number of farms decreased from 27,053 to 21,065, and average acreage per farm from 120.1% to 107.4%. The value of all farm property, however, had increased from \$103,704,196 to \$107,084,055. Of the total number of farms in 1925 (21,065), 19,895 or 94.4% were worked by owners or part owners, 1,014 by tenants and 156 by managers. The total value of all farm crops in 1926 was \$19,600,000. Hay was the principal crop; in 1926 the acreage was 486,000 and the yield was 549,000 tons, valued at \$10,311,000. Potatoes was the crop second in importance, valued at \$3,086,000. The yield of fruit in 1924 included 1,327,820 bu. of apples and 3,116 bu. of peaches. Dairying has long been an important industry in New Hampshire. In 1924, the milk production was 38,149,067 gal. and the value of all dairy products was \$7,791,159. The value of the poultry and egg product of 1924

was \$6,456,790. The live stock on the farms of the State on Jan. 1, 1927 included 29,000 horses, 20,000 sheep, 20,000 swine and 117,000 cattle. Potatoes are grown in large quantities north and west of the White mountains; and this district leads in the number of cattle and sheep.

Forests and Fisheries.—Except on the summits of the higher mountains New Hampshire was originally an unbroken forest of which the principal trees were the white pine, hemlock, sugar maple, yellow birch, beech, red oak and white oak in the south, red spruce, balsam and white birch on the upper mountain slopes, and red spruce, white pine, sugar maple, white spruce and white cedar in the other parts of the north. In the year 1925 the State forestry commission reported a timberland acreage of 4,434,793, of which 1,012,753 ac. were in merchantable timber, 1,698,465 ac. in young growth and 1,723,575 ac. in which the timber stands were thin. Of this total 417,744 ac. or 9.42% were owned by the Federal Government and 20,538 ac. or .46%, by the State. The forests of the State produced, in 1925, 261,000,000 board feet of lumber and 217,489 tons of wood pulp.

New Hampshire, with only one coastal county (Rockingham), was in 1924, the least important of the New England States with respect to her fisheries. The total yield of the fisheries amounted to 447,450 lb. valued at \$56,029. Lobsters contributed \$40,000, or over 70% of the value of this yield. Next in importance were haddock (\$4,275), cod (\$3,785) and soft clams (\$3,600).

Minerals.—The most important of the mineral products of New Hampshire, which has long been known as "the Granite State," is granite, which is quarried in the southern part of the State in the area of Lake Winnepesaukee; gneiss, near Concord, Merrimac county, near Milford, Hillsboro county and east of Manchester in Rockingham county; in Sullivan county, near Sunapee; and in the east central region in Carroll county, near Conway and Madison. The value of stone quarried in New Hampshire in 1925 was \$1,712,138, or approximately one-half of the total value of all mineral products of the State. Of this total (\$3,464,837) the only other large items were clay products (valued at \$828,541), sand and gravel (\$316,248), crude feldspar (\$278,736) and mica (\$246,383). Mica, first mined at Grafton, Grafton county, in 1803, was later found in other parts of the State in such quantities that for 60 years New Hampshire was the largest producer of mica in the United States.

Manufactures.—The value of the products for all manufacturing industries of New Hampshire combined for 1919, 1924 and 1925 were \$407,205,000; \$333,124,503; and \$327,400,651, respectively. The number of industries (1,499; 1,078; and 1,038) and the number of wage-earners (83,074; 75,310; and 66,658) showed a corresponding decrease. Textiles, and boots and shoes,

RELATIVE IMPORTANCE OF PRINCIPAL MANUFACTURES, 1925

which represented in 1923 more than one-half the total value, represented in 1925 approximately one-third the total. Cotton goods, the manufacture of which was introduced in 1804, was in 1925 the chief manufactured product. The 17 mills engaged in this industry employed 14,745 wage-earners and had an output valued at \$57,868,732. The manufacture of boots and shoes, the industry second in importance, was carried on in 59 factories, gave employment to 12,275 wage-earners and had a product valued at \$52,631,681. Other industries with a product exceeding \$5,000,000 were: paper and wood pulp (\$37,060,824), woollen goods (\$28,906,292), lumber and timber (\$12,621,867), knit goods (\$9,789,550), foundry and machine shop products (\$9,617,685), textile machines and parts (\$6,934,488), and wooden boxes (\$5,768,412). Most of the manufacturing centres of the State are south of Lake Winnepesaukee. An exception is Berlin, the chief manufacturing centre north of the White mountains, important for its manufacture of paper and wood pulp.

Transportation.—With the exception of the Grand Trunk line in the northern part of the State the several steam railways are owned or leased by the Boston and Maine. This company was the first to operate a railway within the State, service being maintained between Boston, Mass., and Dover, N.H., as early as 1842. The steam railway mileage decreased from 1,256 to 1,234 during the decade 1915-25. The electric railway mileage in 1925 was 259. Since the first State highway aid law was passed in 1903, the amount spent by the highway department has increased annually. A total of \$4,027,000 was expended by this department in 1925 for maintenance and construction of the State roads.

History.—Martin Pring was at the mouth of the Piscataqua in 1603 and, returning to England in the same year, gave an account of the New England coast from Casco bay to Cape Cod bay. Samuel de Champlain discovered the Isles of Shoals and sailed along the New Hampshire coast in 1605, and much more information concerning this part of the New World was gathered in 1614 by Capt. John Smith, who in his *Description of New England* refers to the convenient harbour at the mouth of the Piscataqua and praises the country back from the rocky shore. Under the leadership of Sir Ferdinando Gorges there was formed in 1620 the Council for New England, which procured from King James I. a grant of all the country from sea to sea between 40° and 48° N. lat., and which made nine grants bearing upon the history of New Hampshire. The first of these grants was to John Mason, who has been called "the founder of New Hampshire," on March 9, 1622. The name New Hampshire was first applied to a grant which lay between the Merrimac and Piscataqua, and given to John Mason on Nov. 7, 1629. The first settlement of which there is indisputable evidence was established in 1623 by David Thomson at Little Harbor, now in the town of Rye. Thomson was the head of a company which was organized for fishing and trading and whose entire stock was to be held jointly for five years. He built a house on Odiorne's Point overlooking Little Harbor, and, although he removed to an island in Boston Harbor in 1626, he may have continued to superintend the business of the company until the expiration of the five-year term. At least there was a settlement here which was assessed in 1628, and it may not have been completely abandoned when colonists sent over by the Laconia Company, which had received a grant on Nov. 17, 1629, arrived in 1630. The Laconia Company received its first grant under the erroneous impression that the Piscataqua river had its source in or near Lake Champlain, and its principal object was to establish an extensive fur trade with the Iroquois Indians. The company sent over colonists who occupied the house left standing by Thomson, and, not far away, built "Mason Hall" or the "Great House" in what is now Portsmouth, a name (for the entire settlement) that replaced "Strawberry Banke" in 1653. Edward Hilton with a few associates appears to have established a settlement on Dover Point about the time of Thomson's arrival at Little Harbor, and in the Hilton grant of 1630 it is stated that he had already built houses and planted there; as early as 1630 this settlement was named Dover. In 1638 the Rev. John Wheelwright, an Antinomian leader who had been banished from Massachusetts, founded Exeter on land claimed to have been bought by him from the Indians. In the same year Massachusetts encouraged friendly Puritans to settle Hampton on the same purchase, and about a year later this colony organized Hampton as a town with the right to send a deputy to the general court. Serious dissensions had already arisen between Puritan and Anglican factions in Dover, and Capt. John Underhill, another Antinomian, became for a time a leader of the Puritan faction. Puritan Massachusetts was naturally hostile to the Antinomians at Exeter as well as to the Anglicans at Strawberry Banke. Under these conditions Massachusetts discovered a new claim for its northern boundary. The charter of that colony was drafted under the impression that the Merrimac flowed east for its entire course, but now an investigation was in progress which was to show that its source in Lake Winnepesaukee was several miles north of any of the four settlements in New Hampshire. Accordingly, Massachusetts resolved to make the most of the clause in the charter which described the northern boundary as three English miles

north of the Merrimac river, "or to the northward of any and every part thereof," to ignore the conflicting grants to Mason and to extend its jurisdiction over the offending settlements.

The heirs of Mason protested, but little was done about the matter during the period of Puritan ascendancy in the mother country. Immediately after the resignation of Richard Cromwell, however, Robert Tufton Mason (a grandson of the original proprietor), who had become sole heir in 1655, began petitioning first parliament and later the king, for relief. The commission appointed by the king in 1664 to hear and determine complaints in New England decided that Mason's lands were not within the jurisdiction of Massachusetts, and made an attempt to set up a government under which his claims could be tried, but this was a failure. Mason then petitioned again, and this time Massachusetts was requested to send agents to England to answer his complaints. They arrived in Dec. 1676, and the case was tried before the Lords Chief Justices of the King's Bench and Common Pleas in April, 1677. Mason presented no claim to the right of government, and as to the title to the lands claimed by him the court decided that this was a question between him and the several tenants to be determined by the local court having jurisdiction in such matters. Thereupon Mason, in Jan. 1679, petitioned the king to appoint a governor who should have jurisdiction over all the lands which he claimed, and on Sept. 18 of this year New Hampshire was constituted a separate province with a Government vested in a president and council appointed by the king and an assembly chosen by the people. This was the principal outcome of Mason's persistent efforts to establish his rights to the land.

From 1686 to 1689 New Hampshire formed a part of the Dominion of New England, which, after the first few months, was under Sir Edmund Andros as governor-general. There being no provincial authority in New Hampshire at the close of this period, a convention of the leading citizens of its four towns attempted to establish one. Upon the failure of this attempt, a temporary nominal union with Massachusetts was formed, but in 1692 Samuel Allen, the assign of Mason, caused a royal Government to be established with his son-in-law, John Usher, as lieutenant-governor, and during the remainder of the colonial era New Hampshire was separate from Massachusetts except that from 1699 to 1741 the two had the same governor. The boundary disputes between Massachusetts and New Hampshire were long and bitter. Both provinces granted townships within the disputed territory; Massachusetts arrested men there who refused to pay taxes to its officers, and sought to defer the settlement of the dispute. New Hampshire, being on the more friendly terms with the home Government, finally petitioned the king to decide the matter, and in 1737 a royal order referred it to a commission to be composed of councillors from New York, Nova Scotia and Rhode Island. This body agreed upon the eastern boundary but evaded deciding the southern one. Both parties then appealed to the king, and in 1741 the king in council confirmed the decision of the commission in regard to eastern boundary and established a southern boundary very favourable to New Hampshire. The western boundary was not yet defined, and as early as 1749 a controversy over that arose with New York. The governor of New Hampshire granted in the disputed territory 138 townships which were rapidly settled, but there was a reluctance to incur the expense of a contest with so powerful a neighbour as New York. In 1764 New York procured a royal order declaring the western boundary of New Hampshire to be the western bank of the Connecticut river.

At the outbreak of the Revolution New Hampshire had about 80,000 inhabitants, the great majority of whom were with the patriot or Whig Party during that struggle. By June, 1775, the once popular governor, Sir John Wentworth, was a refugee; on Jan. 5, 1776, the fifth Provincial Congress established a provisional Government; June 15 the first assembly elected under that Government declared for independence; and on Aug. 16, 1777, the important victory at Bennington was won by New Hampshire and Vermont troops under the command of Gen. John Stark, who had a commission from New Hampshire. Six States had ratified the Federal Constitution when the New Hampshire convention met at Exeter on Feb. 13, 1788, to accept or reject that instrument, and so

great was the opposition to it among the delegates from the central part of the State that after a discussion of ten days the leaders in favour of ratification dared not risk a decisive vote, but procured an adjournment in order that certain delegates who had been instructed to vote against it might consult their constituents. Eight States had ratified when the convention reassembled at Concord on June 17, and four days later, when a motion to ratify was carried by a vote of 57 to 47, adoption by the necessary nine States was assured.

National elections in New Hampshire were carried by the Federalists until 1816, except in 1804 when President Thomas Jefferson won by a small majority; but within this period of Federalist supremacy in national politics the Democrat-Republicans elected the governor from 1805 to 1812 inclusive except in 1809. In 1816 the Democrats won both State and National elections; and out of the transition from Federalist to Democratic control, which was effected under the leadership of William Plumer (1750–1850), a prominent politician in New Hampshire, arose the famous Dartmouth College Case. As the trustees of this institution were Federalists with the right to fill vacancies in their number, the Democrats attempted to gain control by converting it into a State university and increasing the number of trustees, but when the case reached the U.S. Supreme Court that body pronounced (1819) the charter a contract which the Federal Constitution forbade the State to violate. Heretofore the Federalist régime had taxed the people to support the Congregational Church, but now the Baptists, Methodists and Universalists joined the Democrats, and in 1819 this State support was abolished by the "Toleration Act." Because of Daniel Webster's arguments in the Dartmouth College Case, and because his party had favoured the support of the Congregational Church by public taxation, he became very unpopular in this his native State. Accordingly, his denunciation of President Andrew Jackson's bank policy added strength to the Jacksonian Democracy, and, later, his Whig connections were the greatest source of the Whig Party's weakness in New Hampshire. John Quincy Adams was an intimate friend of William Plumer, the Democratic leader, and carried the State both in 1824 and 1828. The Whigs never won a national or State election, and often their vote was only about one-half that of the Democrats. But the Democrats broke into two factions in 1846 over the question of slavery (see HALE, JOHN PARKER); the American or "Know-Nothing" Party elected a governor in 1855 and 1856; and then control of the State passed to the Republican Party which held it until the election of 1912 when the Democrats carried the State for Wilson and elected Samuel D. Felker governor. The Democrats were again successful in the presidential election of 1916 (Wilson, 43,779, Hughes, 43,723), but did not elect another governor until 1922.

NEW HARMONY, a village in Posey county, Indiana, on the Wabash river, about 22 m. N.W. of Evansville. Pop. (1920) 1,126. It is served by the Illinois Central railway. New Harmony had its beginning in 1814–15, when it became the home of a communistic religious sect known variously as the Harmonists, Harmonites and Rappites, founded in Germany towards the end of the 18th century by George Rapp (1757–1847), a native of Iptingen in Württemberg. Rapp and his followers, who sought to

form a community after the manner of the primitive Christian Church, were persecuted in Germany, and in 1803–04 emigrated to Butler county, Pennsylvania. There they established in 1805 a community known as Harmony, consisting of some 600 persons, who held their property in common and in 1807 adopted celibacy. In 1814 Rapp sold most of his Pennsylvania land and bought about 24,735 ac. (in the next ten years more than 14,000 ac. in addition) on the Wabash river in Indiana Territory. In 1814–15 Rapp and a thousand of his followers settled on the Indiana tract, their headquarters being established at New Harmony or Harmonie as they called it. The settlers, mostly Germans, devoted themselves to agriculture, weaving and leather-working so industriously that they prospered from the start. Rapp, however, in 1825 disposed of his lands and property to Robert Owen, having returned with part of his followers to Pennsylvania and founded a new community known as Economy (*q.v.*), in Beaver county, where he died in 1847. Intent on founding a socialistic community, Owen went to the United States in 1824, and purchased Rapp's lands and live stock for \$182,000. He interested several well-known scientists in his settlement, and with them came to New Harmony in the spring of 1826. Within six months the community numbered over 1,000. The greater part of the settlers, however, were impractical theorists or adventurers. Constitution after constitution was adopted, and with the adoption of each new constitution and with each new religious discussion a group would secede and form a separate community—in 1828 there were ten. The whole organization broke up in 1827, and Owen left New Harmony in 1828. The Working Men's Institute Public library, founded in 1838 by William Maclure, had in 1907 18,000 volumes; the collection is rich in works dealing with socialism.

NEWHAVEN, a seaport of Sussex, England, 56 m. S. from London by rail, on the English Channel at the mouth of the Ouse. Pop. (1921) 6,435. The port is protected by fortifications. A harbour was first granted to Newhaven in 1713, and during the early part of the 18th century it possessed a large shipping trade. It is now a packet station with a daily service of fast steamers to Dieppe. The tidal harbour is enclosed by two piers and a breakwater, the area being about 30 ac., and the quayage 1,400 yd. With France there is a large traffic in wines, spirits, silk, fruit, vegetables and general provisions.

NEW HAVEN, the largest city of Connecticut, U.S.A., a port of entry, the county seat of New Haven county and the seat of Yale university; in the south-western part of the State, on Long Island sound, 72 m. E.N.E. of New York city. It is on Federal highway 1, and is served by the New York, New Haven and Hartford railroad, interurban trolleys, motor-bus and truck lines and coastwise steamers. Pop. (1920) 162,537 (28% foreign-born white); 1928 local estimate 187,900.

The city occupies 22.4 sq.m. at the head of a broad, deep bay, into which empty three small streams (the Quinipiac, the Mill and the West rivers). Its site is a level, sandy plain, behind which rises a line of hills, terminating in two spurs, East Rock (360 ft. high) and West Rock (400 ft.), respectively 2½ and 2 m. from the Green. On the central Green of 16 ac., reserved for the public when the town was laid out, are three churches built in 1814: Trinity (Protestant Episcopal), United (Congregational) and Center (Congregational; designed by Ithiel Towne). Facing the Green are some of the buildings of Yale university (*q.v.*), a large hotel and the principal public buildings. The Harkness tower of the memorial quadrangle of the university can be seen from the Green, and near by is the old Grove Street cemetery, containing the graves of many famous Americans. The Yale Bowl (seating 78,000) is in the western part of the city. New Haven has long been called "the city of elms." Parks, playgrounds and public squares cover 1,750 acres. In West Rock park is a cave where the regicide judges Whalley and Goffe are said to have been hid for several weeks when pursued by royal offi-

cers in 1661. Nathan Hale park contains old Ft. Hale (used in 1812), with its moat and defences well preserved. A large tract at Lighthouse point (the eastern end of the harbour) is developed as a municipal bathing beach and seaside park. New Haven is the seat of a State normal school (established 1893), Albertus Magnus College for Women (Roman Catholic), Arnold College for Hygiene and Physical Education, New Haven college, and Connecticut College of Pharmacy. The public school system includes 60 grade and 4 high schools. There are eight parochial schools, and a number of widely-known private academies for boys and for girls, including the Hopkins Grammar school, established in 1664. Among the newspapers are the morning *Journal-Courier* (Independent, established 1766), the evening *Register* (Independent, 1812), the *Times-Union* and four Italian weeklies. Several scientific and learned periodicals are published here.

New Haven is an important commercial and industrial city. The general offices of the New York, New Haven and Hartford railroad are here, and just outside the city is its Cedar Hill freight classification yard, covering 1,160 ac. The traffic of the harbour (nearly all domestic commerce) amounted to 1,282,776 tons in 1926, valued at \$112,482,881. There are 277 wholesale houses, doing a large business. The manufacturing industries are widely diversified and highly specialized, with an output in 1925 valued at \$110,506,218. Among the leading products are guns, ammunition, hardware and clocks. A coke plant manufactures gas which is piped to towns as far as Hartford. Bank debts in 1927 aggregated \$1,289,211,000. The city's assessed valuation for 1927 was \$315,738,245. It operates under a mayor and aldermen form of government. The death rate is low.

In the spring of 1638 a company of English Puritans, led by Theophilus Eaton and the Rev. John Davenport, established a settlement here. It was governed under a "plantation covenant" until June 4, 1639, when the "free planters" adopted a theocracy. In 1643-44 the towns of Guilford, Milford, Stamford, Branford and Southold on Long Island were admitted to the "New Haven Jurisdiction." The government of the Jurisdiction was of the strictest Puritan type, but some of the 45 "blue laws" ascribed to it were enactments of other New England Colonies, and some were pure invention. In 1664 New Haven, with the other towns (except Southold) of the Jurisdiction, became part of the Colony of Connecticut, and in 1784 it was chartered as a city. From 1701 to 1873 New Haven was one of the capitals of Connecticut. A State house (designed by Ithiel Towne after the temple of Theseus) stood on the Green, or market place, from 1827 until 1889. In 1716 the Collegiate School of Connecticut, which developed into Yale university, was moved to New Haven from Saybrook. After 1763 a thriving trade with the West Indies, Newfoundland and neighbouring ports on the Atlantic coast began to develop, which flourished, with some periods of depression, until the War of 1812; and after 1800 commerce sprang up with China, the East Indies, the Pacific and the South Seas. A collector of the port was appointed in 1760. In 1769 the merchants at a public meeting unanimously agreed not to import goods from England, but in June 1770, they renounced the agreement and voted to open the port. When the news of the embargo of Boston arrived, a committee of correspondence was formed at once; and through the Revolution the people supported the American cause with ardour, though there were many Loyalists in the town, 75 of whom had property confiscated. On July 5, 1779, the town was invaded and sacked by Gen. Tryon, but he was driven out before he could burn it. When the War of 1812 opened there were fully 600 seamen in the city (among them Captain Isaac Hull), all engaged in privateering or in the regular naval service of the United States. Manufacturing began early. Shoes were shipped from the town in 1647 and iron works were opened in 1656. The loss of foreign trade through the War of 1812, the opening of the Farmington canal in 1828, and the building of the railroad in 1833-38 gave such impetus to industrial development that manufacturing rapidly became the chief interest of the city. In 1820 the population was 8,327; in 1860, 39,267; in 1900, 108,027. New Haven has been the birthplace or the home of many inventors, including Eli Whitney, Eli Whit-

ney Blake, Charles Goodyear, Thomas Sanford, James Brewster, David Bushnell, S. F. B. Morse, Elias Loomis, Chauncey Jerome and Henry S. Parmelee; and it was the home of Noah Webster and Willard Gibbs.

NEW HEBRIDES, an island group in the western Pacific, under French and British joint administration. Area about 5,700 sq. miles. Pop., natives about 60,000, Europeans 882, other nationalities 2,440. For full account of geography, etc., see PACIFIC ISLANDS.

HISTORY

The Portuguese Pedro Fernandez de Quiros, sighting Espiritu Santo in 1606, thought he had discovered the great southern continent then believed to exist, and named it Australia del Espiritu Santo. Louis de Bougainville visited the islands in 1768, and Captain Cook, who gave them the name they bear, in 1774. The subsequent visits of several explorers, the exploitation of the sandal-wood, and other products by traders and the arrival of missionaries helped to open up the islands and to give them a certain commercial importance by the middle of the 19th century. Trade was mainly with New Caledonia, and France was thus indicated as the dominant power in the New Hebrides; even British planters pressed France to annex the islands in 1876, but in the following year some of the missionaries urged the same course on England. In 1878 the islands were declared neutral by Great Britain and France. The presence of British and French settlers under independent authority led to unsatisfactory administration, especially in regard to the settlement of civil actions and jurisdiction over the native population. As to the establishment of commercial supremacy, French interests clashed with Australian, and in 1882 M. John Higginson of New Caledonia (d. 1904) consolidated the former by founding the trading society which afterwards became the *Société française des Nouvelles-Hébrides*. In 1886 one of the most serious of many native outbreaks occurred, necessitating a French demonstration of force from New Caledonia. An Anglo-French convention of Nov. 16, 1887, provided for the surveillance of the islands (protection of life and property) by a mixed commission of naval officers. The Anglo-French agreement of 1904 had a clause providing for an arrangement for proper jurisdiction over the natives and for the appointment of a commission to settle disputes between British and French land owners.

On Oct. 20, 1906, a convention was signed in London, confirming a protocol of the preceding Feb. 27, and providing that "the group of the New Hebrides, including the Banks and Torres Islands," should form "a region of joint influence," in which British and French subjects should have equal rights in all respects, and each power should retain jurisdiction over its own subjects or citizens. The claim of other powers to share the joint influence was excluded by the provision that their subjects resident on the islands must be under either British or French jurisdiction. A British and a French high commissioner were appointed, each assisted by a resident commissioner; provision was made for two police forces of equal strength, and the joint naval commission of 1887 was retained for the purpose of keeping order. The high commissioners were given authority over the native chiefs. A joint court was established, consisting of two judges, appointed respectively by Great Britain and France, and a third, to be president, and not a British subject or French citizen, appointed by the king of Spain. The convention provided against the establishment of a penal settlement and the erection of fortifications.

This convention was bitterly criticized in Australia on the ground that many of the provisions which nominally established equality between British and French would operate in practice to the advantage of the French; and there was no little dissatisfaction on the ground that the Australian Government was neither represented at the preliminary conference, nor fully consulted during the negotiations. A second protocol of Aug. 1914, ratified by France and England on March 18, 1922, guaranteed British, French and native interests, fixed the conditions of land-tenure and provided regulations for the recruiting of native labour. Cannibalism still prevails on Espiritu Santo, Malekula and Pentecost Islands.

See *Parliamentary Papers, France*, No. 1 (1888 and 1906); and "Correspondence relating to the Convention..." (Cd. 3288) (1907); M. Johnson, *Cannibal Land (New Hebrides)* (1922). (See also PACIFIC OCEAN.)

NEW IBERIA, a city of southern Louisiana, U.S.A., 125 m. W. of New Orleans, on Bayou Teche and Federal highway 90; the county seat of Iberia parish. It is served by the Missouri Pacific and the Southern Pacific railways, and by river steamers and barges. Pop. 6,278 in 1920 (34% negroes). This region is the home of the "Acadians" from Nova Scotia, a picturesque and rich agricultural country. Within a few miles are Avery, Jefferson and Weeks islands, all of which have great salt mines. On Jefferson island was the former home (Bob Acres) of Joseph Jefferson, and on Avery there is a large bird refuge. The city was laid out in 1835 and chartered in 1839.

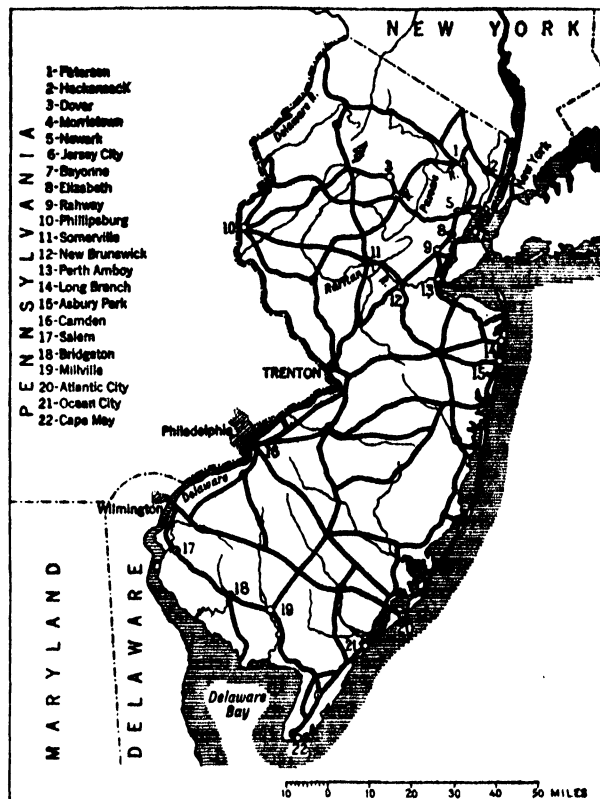

NEW IRELAND, an island of the Bismarck archipelago, lying east of New Guinea, in the Pacific ocean, and north-east of New Britain, practically at right-angles to its northern end (German, Neu-Mecklenburg; native, *Tombara*). It is long and narrow, very mountainous (maximum height, 6,500 ft.), with no rivers of any size. Geologically, it is older than New Britain (*q.v.*, see also NEW GUINEA), but it has not the definite volcanic appearances of that island. The coast line is fairly even, and there are good harbours at Kaewieng, Namatanai and Muliama. It is divided into two districts, northern (Kaewieng), and southern (Namatanai), the latter including the small island of New Hanover. Kaewieng is a port with a wharf capable of berthing ships up to 2,000 tons, and has substantial government buildings. There are fair roads in many places, and there is steamer communication with New Britain and the mainland. The natives resemble those of New Britain. New Ireland formed part of German New Guinea; it was captured by Australian forces in 1914, and was mandated by the League of Nations to Australia, by which country it is now administered. The island was seen by Jacob Lemaire and William Cornelis Schouten in 1616, recognized as separate from New Guinea by Dampier, in 1700, and by Philip Carteret, in 1767, as being separate from New Britain.

NEW JERSEY, popularly known as the "Garden State," is one of the Atlantic coast States of the American Union, lying between 41° 21' 22.6" and 38° 55' 40" N. lat., and 75° 35' and 73° 53' 39" W. longitude. It is bounded, north by the State of New York, east, by the Hudson river, which separates the State from New York, and by the Atlantic ocean; and south and west by the Delaware bay and river, which separate New Jersey from Delaware and Pennsylvania. All the boundaries except the northern are natural. New Jersey has an extreme length, north and south, of 166 m., an extreme width, east and west, of 57 m. and a total area of 8,224 sq.m., of which 710 sq.m. are water-surface.

Physical Features.—There are within the State four distinct topographic belts—the Appalachian, the Highlands, the Triassic Lowland and the Coastal Plain. The folded Appalachian belt crosses the north-west corner of the State, and includes the Kittatinny mountain and valley. The mountain has a north-east-south-west trend, crossing the Delaware river at the Delaware Water Gap and continuing south-west into Pennsylvania. Where the crest of the ridge enters the State its elevation is 1,539 ft.; at High Point, 1½ m. S.W., the ridge attains a height of 1,805 ft., the highest point within the State. A short distance south-west of this point, in a depression in the crest, is Lake Marcia, at an elevation of 1,570 feet. At the Water Gap the ridge is cut through to its base, and the Delaware river flows through the opening. This gap, 900 ft. wide at the base and 4,500 ft. wide at the top, with sides rising very abruptly to a height of 1,200 ft. and more, is an impressive sight. The Kittatinny valley, south-east of and parallel to the Kittatinny range, is about 40 m. long and 12 m. wide and has an average elevation of 700 feet.

South-east of the Kittatinny valley, and parallel with it, lies the second topographic belt, the Highlands. This region embraces an area of 900 sq.m., having a length, north-east to south-west, of 60 m. and a width varying from 9 to 18 miles. It consists of an upland plateau now dissected by streams into a series of ridges. The average elevation of the Highlands is about 1,000 feet. The

third belt, called the Triassic Lowland, occupies about one-fifth of the surface of the State. Its north-western border is marked by a line drawn south-west across the State through Pompton, Morristown, Lebanon and Highbridge to the Delaware; its south-eastern border by a line drawn from Woodbridge to Trenton. The surface is irregular, with altitudes ranging from about sea-level to 900 feet. A noteworthy feature of this area is the series of

MAP SHOWING THE MAIN ROADS IN NEW JERSEY

trap rock ridges. The best known of these is the Palisades ridge, or simply the Palisades, which lines the western bank of the Hudson river. The trap extends to the Kill van Kull channel, and includes, among other ridges, the so-called First and Second Watchung (or Orange) mountains west of the group of suburbs known as the "Oranges." South-east of the Triassic Lowland lies the fourth topographic belt, the Coastal Plain, containing an area of 4,400 sq.m., or slightly more than one-half the entire surface of the State. This belt, bordered on the east, south and west by water, is highest near its centre and lowest along its margins. One-third of the Coastal Plain is below 50 ft. in altitude; two-fifths are between 50 and 100 ft.; and somewhat more than a fourth of the area is over 100 ft. above sea-level. About one-eighth of the area consists of tidal marsh, lying chiefly between the long sandy ridges or barrier beaches of the Atlantic coast and the mainland. For the entire State the average elevation is 250 feet.

The four topographic belts of the State correspond very closely to the outcrops of its geological formations; the rocks of the Appalachian belt being of Palaeozoic age; the formation of the Highlands, Archæan; that of the Triassic Lowland, Triassic; that of the irregular hills of the Coastal Plain, Cretaceous and Tertiary. The great terminal moraine of the glacial epoch crosses the north-east-south-west topographic belts of the State, in an irregular line west and north-west, from Staten Island, N.Y.

The Delaware river, from its junction with the Neversink creek to the capes, flows along the western and southern borders of the State for a distance of 245 m., and has a total drainage area in New Jersey of 2,345 sq. miles. Of equal importance is

the Hudson, whose lower waters, forming the north-eastern boundary of New Jersey for a distance of 22 m., drain a very small part of the State, but have contributed materially to the State's commercial development. Of the streams of the Highlands and the Triassic Lowland, the Passaic river is the most important. Rising in the north-east—in the southern part of Morris county—it pursues a winding north-easterly course, passing through a gap in the trap rock at Little Falls, and by means of a cascade and a mile of rapids descends 40 feet. At Paterson (*q.v.*), 3 m. farther, the stream passes through a crevasse in the trap rock and has a sheer fall of 70 ft. (the Great Falls of the Passaic). The stream then makes a sharp bend southward and empties into Newark bay. The Passaic and its small tributaries drain an area of about 950 sq. miles. The Hackensack river enters the State about 5 m. W. of the Hudson river, flows almost parallel with that stream, and empties into Newark bay, having a length of 34 m. and a drainage area of 201 sq. miles. The Raritan river, flowing eastwardly through the centre of the State, is the largest stream lying wholly within New Jersey, and drains 1,105 sq. miles. Among the Highlands are numerous lakes, which are popular places of resort during the summer months. Of these the largest and the most frequented are Lake Hopatcong, an irregular body of water in Morris and Sussex counties, and Greenwood lake, lying partly in New York and partly in New Jersey.

The soils of the State exhibit great variety. Those of the northern and central sections are made up in part of glacial drift; those of the south are sandy or loamy, and are locally enriched by deposits of marl. The most fertile soils of the State lie in the clay and marl region, a belt from 10 to 20 m. wide extending across the State in a general south-westerly direction from Long Branch to Salem.

Climate.—Between the extreme northern and southern sections of the State there is a greater variation in climate than would naturally result from their difference in latitude. This is due to the proximity of the ocean in the south and to the relatively high altitudes in the north. The mean annual temperature ranges from 49.2° F at Dover, in the north, to 55.4° at Bridgeton, in the south. At Dover the mean for the winter is 28°, with an extreme minimum recorded of -13°; and the mean for the summer is 70°, with an extreme maximum recorded of 102°. At Atlantic City the mean annual temperature is 52°; for the winter it is 34°, with an extreme of -7°; and for the summer, 70°, with an extreme of 104°. The beaches of New Jersey have rapidly built up with towns and cities that have become popular summer resorts—among the best known of these are Long Branch, Asbury Park, Ocean Grove, Atlantic City (also a winter resort) and Cape May. The normal annual precipitation is 47.7 in., varying from 46.6 in. on the sea-coast to 49.1 in. in the Highlands and the Kittatinny valley.

Population.—The population of New Jersey at certain selected censuses was as follows: 184,139 in 1790; 211,149 in 1800; 489,555 in 1850; 1,131,116 in 1880; 1,444,933 in 1890; 1,883,669 in 1900; 2,537,167 in 1910; and 3,155,900 in 1920, or an increase of 24.4% during the last decade. The State's rank in population was, in 1920, tenth among the States of the Union. On July 1, 1928, according to the U.S. Census bureau estimate, the population of New Jersey was 3,821,000. Of the native-born white population in 1920, 1,212,675 were of native parentage, 829,058 were of foreign parentage and 256,741 were of mixed parentage. The negro population was 117,132 or 3.7% of the whole. Among the various elements comprising the foreign-born population (738,613) were 157,285 Italians; 92,382 Germans; 90,419 Poles; 73,527 Russians; 65,971 Irish; 46,787 English; 40,470 Hungarians; 36,917 Austrians; and 17,781 Scotch. New Jersey, with 420 inhabitants per square mile, ranked third among the States in density of population. The urban population (in places of 2,500 or more) was 78.4% of the total. The principal cities in 1920 were Newark (414,524), Jersey City (298,103), Paterson (135,875), Trenton (119,289), Camden (116,309), Elizabeth (95,783), Bayonne (76,754) and Hoboken (68,166).

Government.—The State is governed under the Constitution of 1844, with subsequent amendments of 1875 and of 1897. The

only other Constitution under which the State has been governed was that of 1776. The right of suffrage is conferred upon all citizens of the U.S., 21 years of age and over, who have resided in the State for one year and in the county for five months preceding the election. The executive power is vested in a governor, who is elected for a term of three years and may not serve two successive terms, though he may be re-elected after he has been out

GRAPH SHOWING GROWTH OF POPULATION OF NEW JERSEY, 1790-1920

of office for a full term. He receives a salary of \$10,000 a year. If the governor die, resign or be removed from office, or if his office be otherwise vacant, he is succeeded by the president of the senate, who serves until another governor is elected and qualified. The governor's appointive power is unusually large. With the advice and consent of the State senate, he selects the secretary of State, attorney-general, superintendent of public instruction, chancellor, chief justice, judges of the supreme, circuit, inferior and district courts, and the so-called "lay" judges of the court of errors and appeals, in addition to the minor administrative officers. The State treasurer, comptroller and commissioners of deeds are appointed by the two houses of the legislature in joint session.

The legislative department consists of a senate and a general assembly. In the senate each of the 21 counties has one representative, chosen for a term of three years, and about one-third of the membership is chosen each year. The members of the general assembly are elected annually, are limited to 60, and are apportioned among the counties according to population, with the important proviso, however, that every county shall have at least one member. The annual salary of senators and members of the general assembly is \$500. The governor may (since 1875) veto any item in any appropriation bill, but any bill (or item) may be passed over his veto by bare majorities of all members elected to each house. Bills not returned to the legislature in five days become law, unless the legislature adjourns in the meantime. Amendments to the Constitution must first be passed by the legislature at two consecutive sessions (receiving a majority vote of all members elected to each house), and then be ratified by the voters at a special election.

The judicial system is complex and is an interesting development from the English system of the 18th century. At its head is a court of errors and appeals composed of the chancellor, the justices of the supreme court and six specially appointed justices. The latter serve for a term of six years and receive a salary of \$40 per day. The supreme court consists of a chief justice and eight associate justices appointed by the governor for seven years. The chief justice receives an annual salary of \$19,000; the associate justices each receive \$18,000 annually. The circuit court has concurrent jurisdiction with the supreme court except in criminal cases. The 12 circuit court judges are appointed by the governor for a term of seven years, and receive an annual salary of \$16,000. The court of common pleas, which may be held either by the judge of the court of common pleas (county) or by a justice of the supreme court, may hear appeals from the "small cause court," and has original jurisdiction in all civil

matters except those involving the title of real estate. The court of quarter sessions, which may likewise be held by either the judge of the court of common pleas or by a justice of the supreme court, has jurisdiction over all criminal cases except those of treason or murder. The court of oyer and terminer is a higher criminal court, and has cognizance of all crimes and offences whatever. This court is composed of any supreme court justice and the judge of the court of common pleas. Writs of error in cases punishable with death are returnable only to the court of errors and appeals. The orphans' court has jurisdiction over wills, the right of administration and guardianship, etc., but it may refer any matter coming before it to a master in chancery. The court of chancery is administered by a chancellor, ten vice-chancellors and numerous masters in chancery. Besides the ordinary chancery jurisdiction it hears all applications for divorce or nullity of marriage. The chancellor, who is appointed by the governor for a term of seven years, receives an annual salary of \$19,000. Vice-chancellors are appointed by the chancellor for a term of seven years, and receive \$18,000 annually. The district court is composed of 31 judges appointed by the governor for a term of five years. The jurisdiction of this court is limited to the county in which it is held; it has authority over suits of a civil nature in which the sum involved does not exceed \$500. Each county has a surrogate whose duties mainly relate to will cases. In each township there are from two to five justices of the peace, and in cities, police justices. Suits involving not more than \$200 and minor offenses may be tried in justice's or police courts.

For the purposes of local Government the State is divided into counties (21), cities, townships, towns and boroughs. The Government of the towns is administered through a council, clerk, collector, assessor, treasurer, etc., chosen by popular vote; that of the townships is vested in the annual town meeting, at which administrative officers are elected. Any township with more than 5,000 inhabitants may be incorporated as a town, with its Government vested in a mayor and council. Any township or part thereof with less than 4 sq.m. of territory, and less than 5,000 inhabitants, may be incorporated as a borough, with its Government vested in a mayor and council. In 1911 a law was passed allowing cities to adopt a commission form of Government; in 1923 the city manager form was authorized.

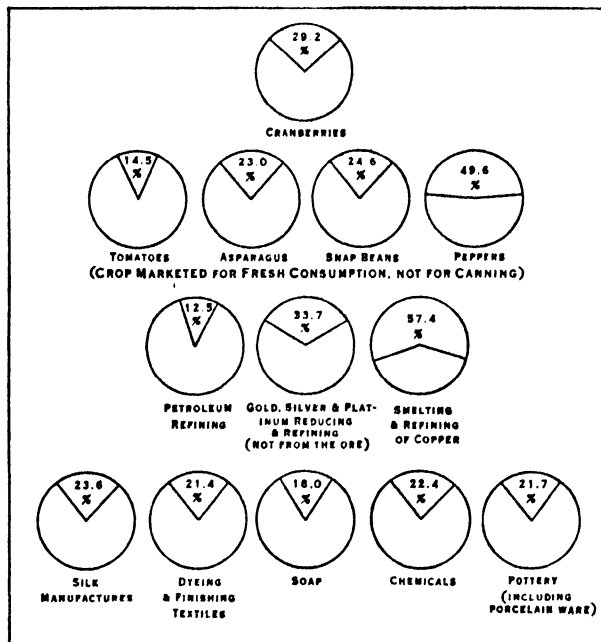

Finances.—The State board of taxes and assessments was created in 1915 by the consolidation of the board of equalization of taxes and the State board of assessors. This board in 1928 had charge of the carrying into effect the laws levying a tax on the gross receipts of gas and electric corporations and of street railway corporations at the average tax rate of the State, in lieu of the tax on property at the local rate; the assessing of all railway and canal companies within the State; the assessing of a State franchise tax against miscellaneous corporations; and the equalization of assessments in the various counties and taxing districts. The net assessed valuation of real and personal property, exclusive of bank and trust company stock, in 1926 was \$5,443,448,817; the State tax rate was \$3.615 on each \$100 of valuation. In the State fund, the total receipts for the year ending June 30, 1926 were \$28,142,921, and the total disbursements, \$27,825,430. The bonded indebtedness of the State on June 30, 1926 was \$67,116,000 distributed as follows: soldiers bonus bonds, \$12,000,000; State highway extension bonds, \$34,000,000; State highway road bonds, \$14,000,000; State highway bridge bonds, \$7,000,000; and State certificates issued to the Agricultural college, \$116,000.

Education.—The Russell Sage Foundation, after an exhaustive examination of the public-school system of the various States, ranked New Jersey in 1920 first among the States east of the Mississippi river, and fourth in the whole country. The public-school system is administered under the direction of a State board of education and a commissioner of education. The former consists of ten members, not more than one of whom shall be from the same county and not more than five from the same political party. At least two of the members must be women. The commissioner of education is appointed by the governor and confirmed by the senate. He decides controversies that arise under the school law, appoints county superintendents, and ap-

portions State funds. All children between the ages of five and 20 are entitled to attend the public schools in the district in which they reside. Attendance at either of public or private school every day such school is in session is required of all children between the ages of seven and 16, unless taught at home or physically or mentally unfit to attend. Children between the ages of 14 and 16 who have completed five grades may be granted a certificate permitting them to work, but they must attend a continuation school. A pension and annuity fund law provides for teachers after reaching 62 years of age or after 35 years of service.

In 1925-26 the total enrolment of pupils was 744,266. The number of teachers was 24,405; of school buildings, 2,240. Nearly one-half of the pupils received manual or industrial training of some sort. The total expenses of operating the public schools in 1925-26 was \$76,034,727. Of this amount, \$57,111,205 were for instruction and maintenance and \$18,923,522 were for construction and repairs. The average salary paid teachers, exclusive of superintendents and assistant superintendents, was \$1.852. The private and parochial schools in 1924, according to the *Statistical Abstract*, had an enrolment of 41,214 pupils.

In addition to the regular public schools, the State maintains normal schools at Trenton, Montclair, Newark, Paterson and Glassboro, a school for the deaf at Trenton, and a Manual Training and Industrial School for Colored Youth at Bordentown. An agricultural college and experiment station has long been maintained in connection with Rutgers college, now Rutgers university, at New Brunswick. In 1918 the legislature designated Rutgers as the State University of New Jersey. The New Jersey College for Women affiliated with the State university was opened in Sept. 1918. There are industrial schools in Newark, Hoboken and Trenton supported in part by the State. Among the institutions of higher education not receiving State aid are Princeton university (*q.v.*) at Princeton; Stevens Institute of Technology at

PROPORTION OF TOTAL U.S. PRODUCTION OF CERTAIN CROPS AND MANUFACTURED PRODUCTS PRODUCED IN NEW JERSEY

Hoboken; Upsala college at East Orange; Steon Hall college at South Orange; St. Joseph's college at Princeton; Georgian Court college at Lakewood; College of St. Elizabeth at Convent Station; Alma college at Zarephath; New Jersey Law school at Newark; Drew Theological seminary at Madison; Princeton Theological seminary at Princeton; and Immaculate Conception Theological seminary at South Orange.

Charities and Corrections.—The State supports the following charitable and correctional institutions all under the supervision of the State department of institutions and agencies: hos-

pitals for the insane at Trenton and Greystone Park; a sanatorium for tuberculous diseases at Glen Garden; a village for epileptics near Skillman; a home for feeble-minded women at Vineland; State colonies for feeble-minded males at New Lisbon and Woodbine; a home for disabled soldiers at Kearny; a home for disabled soldiers, sailors and their wives at Vineland; a reformatory for women, near Clinton and a similar institution for men at Rahway; a State home (reform school) for boys, near Jamesburg, and for girls, near Trenton; and a State prison at Trenton.

Agriculture.—The farm acreage of New Jersey steadily decreased between 1900 and 1925, the total acreage for these years being respectively 2,840,966 and 1,924,545. During the same period the number of farms decreased from 34,294 to 29,671. The average size of the farms was 64.9 ac. in 1925 as compared with 82 ac. in 1900. Only 4,723 or 15.9% of the total number of farms were operated by tenants. The value of all farm crops in 1926 was \$53,100,000 as compared with \$60,100,000 in 1925.

In 1926, according to the *Year Book* of the U.S. department of agriculture, the principal field crops were: potatoes, 7,250,000 bu. (\$11,237,500); hay, 416,000 tons (\$8,187,300); Indian corn, 8,648,000 bu. (\$6,918,400); wheat, 1,320,000 bu. (\$1,742,000); oats, 1,650,000 bu. (\$825,000) and rye, 779,000 bu. (\$740,150). New Jersey ranks among the leaders in the commercial production of many fruits. The fruit and vegetable crops have a total annual value of approximately \$25,000,000. In the production of peaches (3,000,000 bu. in 1926), New Jersey is outranked by California and Georgia only.

The number and value of each of the various classes of live stock in the State on Jan. 1, 1927, were as follows: dairy cattle, 119,000 (\$13,090,000); other cattle, 38,000 (\$1,790,000); swine, 60,000 (\$1,260,000); sheep, 6,000 (\$71,000); horses, 54,000 (\$5,908,000); mules, 5,000 (\$590,000). The dairy industry is confined chiefly to the production of milk for consumption in New York, Philadelphia and other large cities. The value of dairy products in 1924 was \$15,087,874. Poultry-raising also is an important industry; in 1924 the value of all chickens raised and eggs produced was estimated at \$18,763,344.

Manufacturing.—Manufacturing has long been the leading industry of New Jersey. In 1925 the value of the products of the State's 8,204 manufacturing establishments was \$3,539,181,253; wages paid to 425,377 employes amounted to \$576,235,826. New Jersey ranked first among the States in the refining of petroleum, in the smelting and refining of copper, in shipbuilding, in dyeing and finishing textiles, in the manufacture of silk goods, phonographs and upholstering materials. The State's industrial importance is due, in a great part, to the excellent transportation facilities, and to the proximity of large markets and of great natural resources, such as the clays of New Jersey and the coal and iron of Pennsylvania. The chief manufacturing centres in 1925, as judged by the value of their products, were: Newark (\$238,119,543), Jersey City (\$139,234,933), Paterson (\$94,626,268), Camden (\$81,703,257), Trenton (\$63,545,450), Bayonne

UNITED STATES: \$543
NEW JERSEY: \$983

VALUE OF MANUFACTURES OF NEW JERSEY PER CAPUT COMPARED WITH THAT FOR THE U.S. (1925)

(\$53,762,760), Kearny (\$49,598,897), Elizabeth (\$45,060,486), Passaic (\$39,140,591) and Perth Amboy (\$34,685,343). Newark is the centre for electrical machinery, paints and varnishes, jewelry, tanning and finishing leather, chemicals, and bread and bakery products. Paterson's chief industries are the dyeing and finishing of textiles and the manufacture of silk. Jersey City is the centre of the State's slaughtering and meat packing industry. Trenton is famous for its pottery and porcelain ware. The ten principal industries of New Jersey, based on the value of their products in 1925, were as follows:

Industry	Wage-earners	Value in dollars
Petroleum refining	9,198	\$297,288,102
Smelting and refining copper	3,362	224,039,089
Silk manufacturing	28,196	190,712,394
Electrical machinery and apparatus	23,800	151,471,610
Chemicals	11,722	122,699,466
Foundry and machine shop products	19,149	110,202,345
Motor vehicles	4,847	101,519,589
Dyeing and finishing textiles	19,270	92,442,884
Worsted goods	13,727	78,982,704
Cigars and cigarettes	8,739	67,745,767

Other manufactures valued in 1925 at more than \$50,000,000 were: canning and preserving fruits and vegetables; gold, silver and platinum, reducing and refining; bread and bakery products; rubber goods; paints and varnishes; and soap.

Minerals.—The total value of the State's mineral products was \$76,752,288 in 1925. The value of clay products in 1924 was \$46,414,167. Of this total, the value of pottery was \$25,968,314, and of brick and tile \$20,445,851. The zinc output of the State in 1924 was 84,370 short tons, valued at approximately \$12,800,000. In Warren and Sussex counties are abundant materials for the manufacture of Portland cement. In 1925, the chief stone products were trap rock, limestone, sandstone and granite, having a total value of \$3,656,943. The manufacture of iron in New Jersey dates from 1674, when the metal was reduced from its ores near Shrewsbury, Monmouth county. The product of the iron mines in 1925 was only 164,523 long tons, valued at \$678,021.

Transportation.—The total railway mileage of New Jersey on Jan. 1, 1926, according to the Interstate Commerce Commission, was 2,292 as compared with 2,352 in 1920. Owing to its geographical position, the State is crossed by all railways reaching New York city from the south and west, and all those reaching Philadelphia from the north and east. The eastern terminals of the southern and western lines running from New York city are situated on the western shore of the Hudson river, in Jersey City, Hoboken or Weehawken; whence passengers and freight are carried by ferry to New York. An exception is the Pennsylvania railway which has constructed a tunnel under the Hudson river, and established a terminal on Manhattan island. Jersey City and Hoboken are also connected with New York by electric railway tunnels under the Hudson river; the Holland Vehicular tunnel connects lower New York city with Jersey City. The 21 electric railway companies within the State operated 1,434 m. of track in 1926.

New Jersey was the first state in the Union to pass (1891) a State aid highway act. Since that early beginning, New Jersey has spent many millions of dollars in constructing and maintaining a State highway system, which on Jan. 1, 1927 consisted of 1,458 miles. Of this total 1,297 were surfaced. In 1926 a total of 657,374 motor vehicles were registered.

The water-borne commerce of New Jersey in 1926, exclusive of that of Hoboken and Jersey City which is included in the port of New York, was 1,539,468 cargo tons of imports and 402,892 cargo tons of exports. The chief ports were Bayonne, Newark, Perth Amboy and Carteret.

History.—The earliest inhabitants of New Jersey of whom there is any certain record were the Lenni-Lennapé or Delaware Indians, a branch of the Algonkin family. They were most numerous in the southern and central portions of the State, preferring the river valleys. In the year 1758 an Indian reservation, said to have been the first established within the present limits of the United States, was established at Edgepelic or Brotherton (now called Indian Mills) in Burlington county.

The first authenticated visit of a European to what is now New Jersey was made under French authority by Giovanni da Verazzano, a Florentine navigator, who in the spring of 1524 sailed within Sandy Hook and dropped anchor in the waters of upper

New York bay. In the following year Estevan Gomez, a Portuguese sailor in the service of the emperor Charles V., is said to have made note of the Hudson and Delaware rivers. Voyages to this region for exploration, trade and settlement, however, may be said to have really begun with the year 1609, when Henry Hudson explored the region between Sandy Hook and Raritan bay and sailed up the river which now bears his name. In 1614 Cornelis Jacobsen Mey explored the lower Delaware, and two years later Cornelis Hendricksen more thoroughly explored this stream. In 1623 the first party of permanent homeseekers arrived at New Amsterdam, and a portion of these formed a settlement on the eastern bank of the Delaware and built Ft. Nassau near the site of the present Gloucester City. On the western bank of the Hudson the trading post of Hobocanhackingh, on the site of the present city of Hoboken, was established at an early date. From these places and from New Amsterdam the Dutch spread into the Raritan valley.

In the meantime colonists of another nationality had set foot on the shores of the lower Delaware. In 1638, 50 Swedish colonists landed on the western bank of the Delaware and built Ft. Christina on the site of the modern Wilmington. Five years later, on the eastern bank a triangular fort, called Elfsborg, was constructed near the present Salem. But the Swedish rule was short-lived, as in 1655 the settlements surrendered to Peter Stuyvesant and passed under the control of the Dutch.

On March 12, 1664, Charles II. granted to his brother James, duke of York, all the lands between the Connecticut river and the eastern side of Delaware bay, as well as all the islands between Cape Cod and the Hudson river. An expedition was sent from England in May, under the command of Richard Nicolls, and in the following August the English flag floated over New Amsterdam. In October, Sir Robert Carr took possession of the settlements on the Delaware, and terminated the rule of the Dutch. The few inhabitants of what is now New Jersey acquiesced in the new order. While the expedition commanded by Nicolls was still at sea, the duke of York, by deeds of lease and release, transferred to Lord John Berkeley, baron of Stratton and Sir George Carteret (*q.v.*), all that part of his new possessions extending eastward from the Delaware bay and river to the Atlantic ocean and the Hudson river, and northward from Cape May to a line drawn from the northernmost branch of the Delaware, "which is 41° 40' lat.," to the Hudson river in 41° N. latitude. To this tract the name of Nova Caesarea, or New Jersey, was given in honour of Carteret, who governed the isle of Jersey in 1643-51. In order to attract immigrants, the proprietors in Feb. 1665 published their "Concession and Agreement," by which they made provision for a governor, a governor's council, and an assembly chosen by the freemen and having the power to levy taxes. Special inducements in the way of land grants were offered to persons embarking with the first governor. In the meantime Governor Nicolls of New York, ignorant of the grant to Berkeley and Carteret, had approved certain Indian sales of land to settlers within New Jersey, and had confirmed their titles to tracts in what became known as Elizabethtown, Middletown and Shrewsbury. In 1669 trouble arose between the proprietary governor and the inhabitants of the towns of Shrewsbury and Middletown over the collection of quit-rents. This caused the duke of York to declare that the grants made by Nicolls were null and void; the king enjoined obedience to the proprietors, and quiet was restored. Another change was impending, however, and in Aug. 1673, when a Dutch fleet appeared off Staten Island, New Jersey for a second time became a part of New Netherland. The period of Dutch rule was short, and by the Treaty of Westminster, of Feb. 9, 1674, the territory was restored to England. The Crown lawyers decided that the rights of the proprietors of New York and New Jersey had been extinguished by the conquest, and that by treaty the lands had been reconveyed, not to the proprietors, but to the king. On June 13, 1674, Charles II. accordingly wrote a letter confirming the title and power of Carteret in the eastern half of New Jersey. No similar grant was made to Berkeley, as on March 18 he had sold his interest in the province to John Fenwicke, sometime major in the parliamentary army and later a

member of the Society of Friends, and Edward Byllynge (*d.* 1687), a Quaker merchant. Financial embarrassments soon caused Byllynge to assign his share in trust for his creditors to three Quakers, William Penn, Gawen Lawrie and Nicholas Lucas. Later they acquired Fenwicke's share also. The Quakers then set about seeking a division of the province more to their advantage and, Sir George Carteret having been persuaded by the duke of York to surrender his grant of July 1674, the so-called "quintipartite deed" was executed on July 1, 1676. This instrument defined the interests of Carteret, Penn, Lawrie, Lucas and Byllynge, by fixing a line of partition from Little Egg harbour to a point on the Delaware river, in 41° 40' N., and by assigning the province east of this line (East Jersey) to Carteret and the province west of this line (West Jersey), about five-eighths of the whole, to the Quaker associates.

A very liberal frame of Government for West Jersey, drafted presumably by William Penn, and entitled "the Concessions and Agreements of the Proprietors, Freeholders and Inhabitants of West Jersey in America," was adopted in March 1677. This vested the principal powers of Government in an assembly of 100 members, who were to be chosen annually and to be subject to instructions from their constituents. Religious toleration was assured. In Aug. 1677 the ship "Kent" arrived in the Delaware, with 230 Quakers from London and Yorkshire. These founded a settlement, which became the modern Burlington, and in the next few months several hundred more colonists arrived. But the new colony was never actually governed under "the Concessions and Agreements"; for when in 1680 the duke of York confirmed the title to the land to Byllynge and his associates he conveyed the right to govern to Byllynge alone. Although he was one of the signers of the "Concessions and Agreements," Byllynge now commissioned Samuel Jennings as governor of the province, and the other proprietors acquiesced, appointing Byllynge governor and permitting Jennings to serve as his deputy. Jennings immediately called the first assembly, and this body passed a body of fundamental laws providing for a governor and council.

The death of Sir George Carteret in 1680 gave the zealous Andros another chance to lay claim to jurisdiction over New Jersey. On April 30, 1680, a detachment of troops dragged Philip Carteret, the governor of East Jersey, from his bed and carried him prisoner to New York. Here he was confined for four weeks, and was released only on his promise not to exercise any authority until the matter could be referred to England for adjudication. When the assembly of East Jersey met in June, Andros appeared before it as governor and recommended such measures as he deemed advisable, but the deputies refused to pass them. In England, too, his conduct was disavowed and he was called home to answer charges that had been preferred against him. Sir George Carteret had bequeathed his province to eight trustees, who were to administer it for the benefit of his creditors. Early in 1682, after several unsuccessful attempts to effect a sale by other means, the province was offered for sale at public auction, and was purchased by William Penn and 11 associates for £3,400. Later each of these 12 sold one-half of his share to another associate, thus making 24 proprietors; and on March 14 the duke of York confirmed the sale, and gave them all the powers necessary for governing the province. The Government of the 24 proprietors was liberal. Recognizing the necessity of some one in the province with full power "to do all things that may contribute to the good and advancement of the same," they directed the appointment of the American Board of Proprietors—a body of men identified with the province, who with the deputy-governor were to look after the proprietary interests in such matters as the approval of legislation and the granting of lands, and thereby prevent the delay caused by the transmission of such matters to England for approval. In 1686 Perth Amboy, the newly created port of East Jersey, became its seat of Government.

After his accession to the throne in 1685, James II. showed an unyielding determination to annul the privileges of the colonies, and to unite New York, New Jersey and the New England colonies under a single Government. In order, therefore, to save their rights in the soil, the proprietors of East and West Jersey

surrendered their claims to jurisdiction. Andros, previously appointed viceroy of New England, thereupon received a new commission extending his authority over New York and the Jerseys, and in Aug. 1688 he formally annexed these provinces to the dominion of New England. The seizure of Andros by the people of Boston in April 1689, following the news of the revolt in England against James II., gave the Jersey proprietors an opportunity to resume their rights.

In April 1702 all rights of jurisdiction were transferred to the Crown, while the rights to the soil remained in the proprietors. The provinces of East and West Jersey were then united under a Government similar to that of the other royal provinces. Until 1738 the governor of New York was also governor of New Jersey; after that date each colony had its own governor. The legislature met alternately at Burlington and Perth Amboy, until 1790, when Trenton was selected as the capital of the State.

The four decades following the change to royal Government were years of development disturbed, however, by friction between the assembly and the royal governors, and by bitter disputes, accompanied by much rioting, with the proprietors concerning land-titles (1744-49). Independence of the absentee landlords was again claimed by virtue of the grants made by Nicolls nearly a century before. Agriculture at this time was the main pursuit. Between East and West Jersey certain political and religious differences developed. The former, settled largely by people from New England and Long Island, was dominated by Puritans; the latter by Quakers.

The last colonial assembly of New Jersey met in Nov. 1775. From May 26 to July 2, 1776, the second provincial congress met at Burlington, Trenton and New Brunswick and for a time became the supreme governing power. Following the recommendation of the continental congress, that the colonies should create independent Governments, the provincial congress drafted a provincial constitution, which, without being submitted to the people, was published July 3, 1776. In the State were fought some of the most important engagements of the war. When Washington, in the autumn of 1776, was no longer able to hold the lower Hudson he retreated across New Jersey to the Delaware near Trenton and seizing every boat for miles up the river he placed his dispirited troops on the opposite side and left the pursuing army no means of crossing. With about 2,500 men he recrossed the Delaware on the night of Dec. 25, surprised three regiments of Hessians at Trenton the next morning, and took 1,000 prisoners and 1,000 stands of arms. In a series of movements following up his success he outgeneraled the British commander, Lord Cornwallis and on Jan. 3, 1777, defeated a detachment of his army at Princeton (*q.v.*). The American army then went into winter quarters at Morristown. As the British army under Gen. Clinton was retreating, in June 1778, from Philadelphia to New York, the American army engaged it in the battle of Monmouth (June 28, 1778); the result was indecisive.

After the war New Jersey found its commercial existence threatened by New York and Philadelphia, and it was a feeling of weakness from this cause rather than any lack of State pride that caused the State to join in the movements for a closer Federal Union. In the Federal convention at Philadelphia one of the New Jersey delegates, William Paterson (1745-1800), presented what was called the "New Jersey plan" of union, representing the wishes of the smaller States, which objected to representation in a National Congress being based on wealth or on population. The New Jersey plan left its impress in the provision of the Constitution (approved in the convention on July 7) for equal representation in the national Senate. The Federal Constitution was ratified by a unanimous vote in the State convention which met at Trenton on Dec. 18, 1787.

The State's own Constitution, which had been adopted in 1776 and amended in 1777, retained a number of features of colonial Government ill-adapted to a State increasingly democratic. The basis of representation was the county rather than population; property qualifications were placed on members of the legislative council and of the assembly. These and the property qualifications for suffrage, which was granted to "all inhabitants of this

State of full age, who are worth 50 lb. proclamation money, clear estate in the same," etc., were soon considered undemocratic; and the democratic tendency of certain election officers may be seen from their construing the words "all inhabitants of full age" to include women, and from their permitting women to vote.

Agitation for constitutional reform resulted in a constitutional convention, which met at Trenton from May 14 to June 29, 1844, and drafted a new frame of government, introducing a number of radical changes. This instrument was ratified on Aug. 13 at the polls. The election of the governor was taken from the legislature and given to the people; the powers of Government were distributed among legislative, executive and judicial departments; representation in the assembly was based on population; and the property qualification was abolished.

Toward the political questions that disturbed the American people immediately before the Civil War the attitude of the State was conservative, although a few vestiges of the slavery system remained until the adoption of the 13th amendment to the Federal Constitution. In 1852 the free-soil candidate for the presidency received only 350 votes in New Jersey; and in 1856 the Democratic candidate received a plurality of 18,605 votes, even though William L. Dayton, a citizen of the State, was the Republican nominee for the vice-presidency. In 1860 three of the State's electoral votes were given to Douglas and four to Lincoln. During the Civil War New Jersey furnished 89,305 men for the Union cause and incurred extraordinary expenditures to the amount of \$2,894,385. The State readily consented to the 13th and 14th amendments to the Federal Constitution, but in 1868 withdrew its consent to the latter. The 15th Amendment was rejected by one legislature, but was accepted by its successor, in which the Republican Party had obtained a majority.

Industrially the early part of the 19th century was marked in New Jersey by the construction of bridges and turnpikes, the utilization of water power for manufactures, and the introduction of steam motive power upon the navigable waters. The war of 1812 with England interrupted this material progress, and at its beginning was so unpopular, especially with the Quakers, that the Federalists carried the elections in the autumn of 1812. Material progress in New Jersey after the war is indicated by the construction of the Morris (1824-36) and the Delaware and Raritan (1826-38) canals, and the completion of its first railway, the Camden and Amboy, in 1834.

In the years following the Civil War there was a bitter railway war. New Jersey, in order to encourage canals and railways, had granted monopolistic privileges to several of the earlier companies; by consolidation they had virtually gained a monopoly over the route between New York and Philadelphia. In 1871 these entire properties were leased for 999 years to the Pennsylvania Railway Company. This combination threatened to monopolize traffic, and it was opposed by several of the newer railways and by the general public; in 1873 the State passed a general railway law giving other railways than the Pennsylvania the right to connect New York and Philadelphia.

This same period was marked by great industrial development. Towards corporations the policy of New Jersey was very liberal; there was no limit fixed either to capitalization or to bonded indebtedness; and the tax rate was lower for large than for small corporations. Under this liberal policy so many large combinations of capital were incorporated under the laws of the State that it was sometimes called "the home of the trusts." This method of encouraging corporations was reversed by the passage in 1913 of a series of acts widely known as the "Seven Sisters," the purpose of which was the elimination of the power of trusts to create monopoly, limitation of production, price fixing and restraint of trade. In the meantime laws had been passed limiting public service franchises to 20 years, unless extended to 40 years by the voters of the municipality concerned. The laws governing elections were radically changed in 1911 and subsequently, by provisions extending the application of the direct primary law and providing the blanket ballot and safeguards against frauds. A proposed amendment to the State Constitution in 1915 giving women full suffrage was defeated by over 50,000 votes. By enlightened

labour legislation, New Jersey has done much in promoting the safety and health of the State's large industrial population.

Before 1800 the State was dominated by the Federalist Party; from that date until 1896, except in the Civil War period, it was generally controlled by the Democrats, and from 1896 to 1911 by the Republicans. In the elections for the State executive the Democratic Party was successful from 1910-28 with the exception of the election in 1916. From 1914 the Republicans controlled both branches of the legislature.

Ricardo and W. Nelson (26 vol., 1880-1903); *Documents Relating to the Revolutionary History of the State of New Jersey* (Archives of the State of New Jersey, 2nd series); 5 vol., 1901-17; *Acts of the General Assembly of New Jersey from 1703-1761*, reprinted by A. Leaming and J. Spicer (1881); and *Minutes of the Provincial Congress and the Council of Safety of the State of New Jersey* (1779).

For the period of the Dutch rule, see L. B. O'Callaghan's *History of New Netherland* (1846); John Romeyn Brodhead's *History of the State of New York* (2nd vol., 1853, 1871); E. P. Tanner, *The Province of New Jersey* (1908), the most thorough study of the period from 1664 to 1738; Edgar J. Fisher, *New Jersey as a Royal Province 1738 to 1776* (1911), an excellent account of the closing years of the colonial period; Samuel Smith's *History of the Colony of Nova Caesarea, or New Jersey* (1765; 2nd ed., 1877), still one of the best accounts of the colonial period, and particularly valuable on account of its copious extracts from the sources, many of which are no longer accessible; see, also, William W. Whitehead's "The English in East and West Jersey, 1664-1689" (in vol. iii. of Justin Winsor's *Narrative and Critical History of America*), and Sydney G. Fisher, *The Quaker Colonies; a Chronicle of the Proprietors of the Delaware* (1919). Other useful contributions are A. D. Mellick, *Story of an Old Farm; or, Life in New Jersey in the 18th Century* (Somerville, N.J., 1889), full of interesting details; F. B. Lee and others, *New Jersey as a Colony and as a State* (4 vol., with an additional biographical volume, rather unevenly proportioned, and inaccurate as to details); William Nelson, *The New Jersey Coast in Three Centuries* (2 vol., 1902); Isaac S. Mulford, *Civil and Political History of New Jersey* (1851); W. A. Whitehead, *East Jersey under the Proprietary Governments* (New Jersey Historical Society Collections, vol. 1., 1875); W. S. Stryker, *Official Register of the Officers and Men of New Jersey in the Revolutionary War* (1872); W. E. Sackett, *Modern Battles of Trenton* (2 vol., 1895-1914), a political history of New Jersey from 1868 to 1913; H. E. Halford, *Woodrow Wilson and New Jersey made over* (1912); *New Jersey Politics During the Period of the Civil War and Reconstruction* (1924). A local history of some interest is *South Jersey, a History 1664-1924* (5 vol., 1924), edit. by Alfred M. Heston. See also the *Collections* and other publications of the New Jersey Historical Society.

NEW JERSEY TEA (*Ceanothus americanus*), a North American shrub of the buckthorn family (Rhamnaceae), called also red-root, native to dry open woods and gravelly banks from Maine to Manitoba and southward to Florida and Texas. Its low, branching stems, 1 to 3 ft. high, which spring from a dark red root, bear ovate, three-ribbed, somewhat downy, toothed leaves and attractive white flowers in umbel-like clusters. During the Revolutionary War the leaves were used as tea. (See CEANOTHUS.)

NEW JERUSALEM CHURCH or NEW CHURCH, the community founded by the followers of Emmanuel Swedenborg (q.v.). Swedenborg himself took no steps to found a church, but having given a new interpretation of Scripture, it was inevitable that those who accepted his doctrine should separate themselves and organize a society in accordance therewith. Those who received them fully during Swedenborg's lifetime were few and scattered, but courageously undertook the task of dissemination, and gave themselves to translating and distributing their master's writings. Two Anglican clergymen were conspicuous in this work: Thomas Hartley (d. 1784), rector of Winwick, and John Clowes (1743-1831), vicar of St. John's, Manchester. Hartley translated *Heaven and Hell* (1778) and *True Christian Religion*

(1781); Clowes, who taught New Church doctrine in the existing churches and was opposed to the forming of new organizations, translated 17 volumes, including the *Arcana Coelestia*, and published over 50 volumes of exposition and defence. Through his influence Lancashire became the stronghold of the Swedenborgians.

The first organised congregation of Swedenborgians met in a church in Great Eastcheap in January 1788; and in April 1789 a General Conference of British Swedenborgians was held in Great Eastcheap Church, followed by another and by the publication of a journal, the *New Jerusalem Magazine*, in 1790. In the provinces the first church was at Birmingham (1791), followed by one at Manchester and another at Liverpool (1793). The Accrington church, the largest in Great Britain, was founded in 1802. Many of the early converts to the New Church were among the most fervent advocates of the abolition of slavery, one was the medical officer of the first batch of convicts sent to Botany Bay.

In 1815 the Conference took up the question of home missionary work, and its agents were able to found many branches of the church. In 1813 the Manchester and Salford (now the North of England) Missionary Society was founded, chiefly to provide preachers for the smaller churches in its area; in 1857 a National Missionary Institution was founded and endowed, to which most of the local ones have been affiliated. Other denominational agencies have been concerned with the printing and circulation of Swedenborgian literature, a training college for the ministry (founded in 1852), and a Ministers' Aid Fund (1854), and an Orphanage (1881). The constitution of the New Church is of the Independent Congregational type; the Conference may advise and counsel, but cannot compel the obedience of the societies. Returns for 1928 showed 70 societies with about 6,300 members.

The New Church in Europe.—In Sweden the Philanthropic Exegetic Society was formed by C. F. Nordenskiöld in 1786 to collect documents about Swedenborg and to publish his writings. The introduction of alchemy and mesmerism led to its dissolution in 1789, but its work was continued by the society "Pro fide et caritate," which existed from 1796 to 1820. For many years the works of Swedenborg and his followers were proscribed, and receivers of his writings fined or deprived of office, but in 1866, when religious liberty had made progress, the cause was again taken up; in 1875 the society of "Confessors of the New Church" was formed in Stockholm, and propaganda has been carried on in most of the towns of Sweden, as also in Norway and Denmark. In Germany the great name is that of Immanuel Tafel (d. 1863), librarian of Tübingen, who not only edited, translated and published, but in 1848 founded a "Union of the New Church in Germany and Switzerland" which held quarterly meetings. In Switzerland, on the contrary, there is an organized body of the New Church. In France about 1838 J. F. E. Le Boys de Guays began his masterly translation of all Swedenborg's theological works; and nearly every European country has some known adherents.

In America.—About 1784 James Glen, a London Scot, delivered lectures in Philadelphia and Boston and circulated some of Swedenborg's works. Francis Bailey, state printer of Pennsylvania, was attracted by them and became active in their promulgation. During the next ten years a number of prominent men gave their support to the teaching, which spread inland and southward.

In Australia, etc.—The formation of societies in Australia began at Adelaide in 1844. Melbourne and Sydney followed in 1854, Brisbane in 1865. New Zealand has a church at Auckland (1883). Mission churches have been established in Japan, the Philippine Islands and British Guiana; and in 1910 David W. Mooki organized a Church for the natives of South Africa.

See L. P. Mercer, *The New Jerusalem in the World's Religious Congresses of 1893*; *Minutes of the General Conference of the New Church* (annual); *Journal of the Annual Session of the General Convention of the New Jerusalem in the United States of America*.

NEW KENSINGTON, a borough of Westmoreland county, Pennsylvania, U.S.A., on the Allegheny river and the Pennsylvania railroad, 18 m. N.E. of Pittsburgh. Pop. 11,987 in 1920 (24% foreign-born white); estimated locally at 14,500 in 1928. It is a coal-mining centre, and has important manufactures (including tin plate, glass, white lead, aluminum, malleable iron

and car springs), with an output in 1925 valued at \$30,680,293. The borough was founded in 1891 and incorporated in 1892.

NEW LONDON, a city of south-eastern Connecticut, U.S.A., on the west bank of the Thames river, 3 m. from Long Island sound; a port of entry and one of the county seats of New London county. It is on Federal highway 1, and is served by the Central Vermont and the New York, New Haven and Hartford railways, and steamship lines. Pop. (1920) 25,688 (23% foreign-born white); 1928 local estimate 35,000. The city, facing south-east, lies on sloping ground which commands wide views of the sound and the surrounding country from its higher points. The fine natural harbour is a U.S. submarine base, and on Fisher's island (8 m. S.E.) is Ft. H. G. Wright, headquarters of the Long Island Sound harbour defences. At the entrance to the harbour, on either side of the river, stand Ft. Trumbull and Ft. Griswold (no longer in use). New London is a summer resort and a station of several yacht clubs. The annual boat races between Harvard and Yale are rowed on the river near the city. Among the points of special interest are the town mill (1650); the Hempstead mansion (1678); the old cemetery north-east of the city, laid out in 1653; a school-house in which Nathan Hale taught; and a court-house built in 1785. At Ft. Trumbull is the U.S. Coast Guard academy and section base. The Connecticut College for Women (chartered 1911) occupies 350 ac. within the city limits. Two endowed high schools and an endowed industrial school are included in the public school system. The traffic of the harbour (which has a 1,000 ft. pier built by the State in 1917) amounted to 631,044 tons in 1925, valued at \$280,697,973, and consisted largely of general merchandise. Foreign trade was represented by imports of lumber (\$160,000) and exports of automobiles (\$1,254,600). The city's varied manufactures were valued in 1925 at \$13,375,367. The assessed valuation for 1926 was \$42,613,315. New London was founded in 1646 by John Winthrop the younger. In 1658 the present name was substituted for the Indian "Nameaug" and the river Monhegin became the Thames. The city was incorporated in 1784. In the 18th century New London had a large trade with the West Indies, Gibraltar and the Barbary States, but this declined after the War of 1812. It was also an important whaling and sealing port. During the Revolution it was a rendezvous for privateers. The first naval expedition was organized in its harbour in 1776.

NEW LONDON, a city of Wisconsin, U.S.A., on the Wolf river, 20 m. N.W. of Lake Winnebago, in Outagamie and Waupaca counties. It is served by the Chicago and North Western and the Green Bay and Western railways. Pop. (1920) 4,667. It is a dairying region and has various manufacturing industries.

NEW MADRID, a city and the county seat of New Madrid county, Mo., U.S.A., on the right bank of the Mississippi river, about 35 m. S. by W. of Cairo, Ill. Pop. (1910) 1,882; (1920) 1,908. It is served by the St. Louis Southwestern railway and by river barges. The city is a shipping point for a rich grain, cotton, live stock and lumber region. Among its manufactures are lumber, staves and hoops. The municipality owns its water-works. Owing to the encroachments of the Mississippi river, the site of the first permanent settlement of New Madrid is said to lie now about 1½ m. from the east bank of the river, in Kentucky. This settlement was made in 1788, on an elaborately laid out town site, and was named New Madrid by its founder, Col. George Morgan (1742-1810), who, late in 1787, had received a grant of a large tract of land on the right bank of the Mississippi river from Don Diego de Gardoqui, Spanish minister to the United States. The tract lay within the province of "Louisiana," and the grant to Morgan was a part of Gardoqui's plan to annex to that province the western American settlements. Earthquake shocks in 1811 and 1812 caused a general emigration.

New Madrid was occupied by Confederate troops under Gen. Gideon J. Pillow, on July 28, 1861, and after the surrender of Ft. Donelson (Feb. 16, 1862) the troops previously at Columbus, forming the Confederate left flank, were withdrawn to New Madrid and Island No. 10 (in the Mississippi about 10 m. S.). Early in March, Major-General John Pope and Commodore A. H. Foote proceeded against the positions on the left bank; New

Madrid, then in command of Gen. John P. McGown, was evacuated on the 14th; (Admiral) Henry Walke (1808-96), commanding the "Carondelet," ran past the batteries of Island No. 10 and the shore batteries on April 4, and Lieutenant-Commander Egbert Thompson, commanding the "Pittsburgh," on the 7th; meanwhile the Federals under the direction of Col. Josiah W. Bissell (b. 1818), of the engineer corps, had, with great difficulty, constructed an artificial channel to New Madrid across the peninsula (swamp land) formed by a great loop of the Mississippi; troops were conveyed by transports through this channel below the island, Federal batteries having been established on the right bank of the river; the retreat of the Confederates down stream was effectually blocked; they evacuated the island on April 7, and on the 8th the garrison and the forces stationed in the shore batteries, a total of about 7,000, under Gen. W. W. Mackall, was surrendered at Tiptonville.

NEWMAN, FRANCIS WILLIAM (1805-1897), English scholar and miscellaneous writer, younger brother of Cardinal Newman, was born in London on June 27, 1805. He was educated at Ealing, and at Oxford, where he was elected fellow of Balliol in 1826. Conscientious scruples respecting the ceremony of infant baptism led him to resign his fellowship in 1830, and he went to Baghdad as assistant in the mission of the Rev. A. N. Groves. In 1833 he returned to England on behalf of the mission, but finding himself suspected of heterodoxy, he became classical tutor in an unsectarian college at Bristol. In 1840 he became professor of Latin in Manchester New College, the Unitarian seminary long established at York, and the parent of Manchester college, Oxford. In 1846 he became professor in University college, London, where he remained until 1869. In 1847 he published anonymously a *History of the Hebrew Monarchy*, intended to introduce the results of German investigation in this department of Biblical criticism. In 1849 appeared *The Soul, her Sorrows and Aspirations*, and in 1850, *Phases of Faith, or Passages from the History of my Creed*—the former a tender but searching analysis of the relations of the spirit of man with the Creator; the latter a religious autobiography detailing the author's passage from Calvinism to pure theism. It is on these two books that Prof. Newman's fame rests, though he was a versatile writer on many subjects. His last publication, *Contributions chiefly to the Early History of Cardinal Newman* (1891), was severely criticised. He died at Weston-super-Mare on Oct. 7, 1897.

See T. G. Sieveking, *Memoir and Letters of Francis W. Newman* (1909).

NEWMAN, JOHN HENRY (1801-1890), English cardinal, was born in London on Feb. 21, 1801, the eldest son of John Newman, banker, of the firm of Ramsbottom, Newman and Company. At the age of seven Newman was sent to a private school conducted by Dr. Nicholas at Ealing. At the age of 15 he experienced "conversion," an incident which throughout life remains "more certain than that he had hands or feet." In 1816 he matriculated at Trinity college, Oxford. After graduation in 1821 he took pupils and read for a fellowship at Oriel, to which he was elected in 1822. Two years later he was ordained, and became curate of St. Clement's, Oxford. For a year he was vice-principal of the St. Alban's hall, but in 1826 he became tutor at Oriel. In 1827 he was appointed vicar of St. Mary's (to which was attached the chapelry of Littlemore) and in 1831-32 was select preacher before the university. In 1832 a difference with Hawkins, provost of Oriel, on the "substantially religious nature" of a tutorship, led to his resignation from that post. He then went for a tour on the Mediterranean with R. H. Froude, but at that time was still strongly Protestant in his views, as his comments on his stay in Rome show. During this tour he wrote many of the poems in the *Lyra Apostolica*, and "Lead, Kindly Light."

Tractarian Movement.—He was at home again in Oxford on July 9, 1833, and on the 14th Keble preached at St. Mary's an assize sermon on "National Apostasy," which Newman afterwards regarded as the inauguration of the Oxford Movement. In the words of Dean Church, it was "Keble who inspired, Froude who gave the impetus and Newman who took up the work"; but the first organization of it was due to H. J. Rose, editor of the

British Magazine, who has been styled "the Cambridge originator of the Oxford Movement." It was in his rectory house at Hadleigh, Suffolk, that a meeting of High Church clergymen was held, July 25-29 (Newman was not present), at which it was resolved to fight for "the apostolical succession and the integrity of the Prayer-Book." A few weeks later, Newman started, apparently on his own initiative, the *Tracts for the Times*, from which the movement was subsequently named "Tractarian." Its aim was to secure for the Church of England a definite basis of doctrine and discipline, in case either of disestablishment or of a determination of High Churchmen to quit the establishment. The teaching of the tracts was supplemented by Newman's Sunday afternoon sermons at St. Mary's, the influence of which was very great during the next eight years. In 1835 Pusey joined the movement, which, so far as concerned ritual observances, was later called "Puseyite"; and in 1836 its supporters secured further coherence by their united opposition to the appointment of Hampden as regius professor of divinity. His Bampton lectures (in the preparation of which Blanco White had assisted him) were suspected of heresy, and this suspicion was accentuated by a pamphlet put forth by Newman, *Elucidations of Dr. Hampden's Theological Statements*.

At this date Newman became editor of the *British Critic*, and he also gave courses of lectures in a side-chapel of St. Mary's in defence of the *via media* of the Anglican Church as between Romanism and popular Protestantism. His influence in Oxford was supreme about the year 1839, when, however, his study of the monophysite heresy first raised in his mind a doubt as to whether the Anglican position was really tenable on those principles of ecclesiastical authority which he had accepted; and this doubt returned when he read, in Wiseman's article in the *Dublin Review* on "The Anglican Claim," the words of St. Augustine against the Donatists, *securus iudicat orbis terrarum*, words which suggested a simpler authoritative rule than that of the teaching of antiquity. He continued his work, however, as a High Anglican controversialist until he had published, in 1841, *Tract 90*, the last of the series, in which he put forth, as a kind of proof charge, to test the tenability of all Catholic doctrine within the Church of England, a detailed examination of the XXXIX Articles, suggesting that their negations were not directed against the authorized creed of Roman Catholics, but only against popular errors and exaggeration. This theory, though not altogether new, aroused much indignation in Oxford, and, at the request of the bishop of Oxford, the publication of the *Tracts* came to an end. At this date Newman also resigned the editorship of the *British Critic*, and was thenceforth, as he himself later described it, "on his deathbed as regards membership with the Anglican Church." He now concluded that the position of Anglicans was similar to that of the semi-Arians in the Arian controversy; and the arrangement made at this time that an Anglican bishopric should be established in Jerusalem, the appointment to lie alternately with the British and Prussian Governments, was to him further evidence of the non-apostolical character of the Church of England. In 1842 he withdrew to Littlemore, and lived there under monastic conditions with a small band of followers, their life being one of great physical austerity as well as of anxiety and suspense. To his disciples there he assigned the task of writing lives of the English saints, while his own time was largely devoted to the completion of an essay on the development of Christian doctrine, by which principle he sought to reconcile himself to the elaborated creed and the practical system of the Roman Church. In Feb. 1843 he published, as an advertisement in the *Oxford Conservative Journal*, an anonymous but otherwise formal retraction of all the hard things he had said against Rome; and in September, after the secession of one of the inmates of the house, he preached his last Anglican sermon at Littlemore and resigned the living of St. Mary's.

Reception into the Catholic Church.—But still an interval of two years elapsed before he was formally received into the Roman Catholic Church (Oct. 9, 1845) by Father Dominic, an Italian Passionist. In Feb. 1846 he left Oxford for Oscott, where

Bishop Wiseman, then vicar-apostolic of the Midland district, resided; and in October he proceeded to Rome, where he was ordained priest and was given the degree of D.D. by the pope. At the close of 1847 he returned to England as an Oratorian, and resided first at Maryvale (near Oscott); then at St. Wilfrid's college, Cheadle; then at St. Ann's, Alcester street, Birmingham; and finally at Edgbaston, where spacious premises were built for the community, and where (except for four years in Ireland) he lived a secluded life for nearly 40 years. Before the house at Edgbaston was occupied he had established the London Oratory, with Father Faber as its superior, and there (in King William street, Strand) he delivered a course of lectures on "The Present Position of Catholics in England," in the fifth of which he protested against the anti-Catholic utterances of Dr. Achilli, an ex-Dominican friar, whom he accused in detail of numerous acts of immorality. Popular Protestant feeling ran very high at the time, partly in consequence of the recent establishment of a Roman Catholic diocesan hierarchy by Pius IX., and criminal proceedings against Newman for libel resulted in an acknowledged gross miscarriage of justice. He was found guilty, and was sentenced to pay a fine of £100, while his expenses as defendant amounted to about £14,000, a sum that was at once raised by public subscription, a surplus being spent on the purchase of Rednall, a small property picturesquely situated on the Lickey hills, with a chapel and cemetery, where Newman now lies buried.

In 1854, at the request of the Irish bishops, Newman went to Dublin as rector of the newly-established Catholic university there. But practical organization was not among his gifts, and the bishops became jealous of his influence, so that after four years he retired, the best outcome of his stay there being a volume of lectures entitled *Idea of a University*, containing some of his most effective writing. In 1858 he projected a branch house of the Oratory at Oxford; but this was opposed by Manning and others, as likely to induce Catholics to send their sons to that university, and the scheme was abandoned. In 1859 he established, in connection with the Birmingham Oratory, a school for the education of the sons of gentlemen on lines similar to those of the English public schools, an important work in which he never ceased to take the greatest interest. But all this time (since 1841) Newman had been under a cloud, so far as concerned the great mass of cultivated Englishmen, and he was now awaiting an opportunity to vindicate his career; and in 1862 he began to prepare memoranda for the purpose.

Works.—The occasion came when, in Jan. 1864, Charles Kingsley, reviewing Froude's *History of England* in *Macmillan's Magazine*, incidentally asserted that "Father Newman informs us that truth for its own sake need not be, and on the whole ought not to be, a virtue of the Roman clergy." After some preliminary sparring between the two, Newman published, in bi-monthly parts, his *Apologia pro vita sua*, a religious autobiography of unsurpassed interest, the simple confidential tone of which "revolutionized the popular estimate of its author," establishing the strength and sincerity of the convictions which had led him into the Roman Catholic Church.

In 1870 he put forth his *Grammar of Assent*, the most closely reasoned of his works, in which the case for religious belief is maintained by arguments differing somewhat from those commonly used by Catholic theologians; and in 1877, in the republication of his Anglican works, he added to the two volumes containing his defence of the *via media* a long preface and numerous notes in which he criticized and replied to sundry anti-Catholic arguments of his own in the original issues. At the time of the Vatican Council (1869-70) he was known to be opposed to the definition of Papal infallibility, and in a private letter to his bishop (Ullathorne), surreptitiously published, he denounced the "insolent and aggressive faction" that had pushed the matter forward. But he made no sign of disapproval when the doctrine was defined, and subsequently, in a letter nominally addressed to the duke of Norfolk on the occasion of Mr. Gladstone's accusing the Roman Church of having "equally repudiated modern thought and ancient history," Newman affirmed that he had always believed the doctrine, and had only feared the deterrent

effect of its definition on conversions on account of acknowledged historical difficulties.

In 1878 his old college (Trinity), to his great delight, elected him an honorary fellow, and he revisited Oxford after an interval of 32 years. At the same date died Pope Pius IX., who had long mistrusted him; and Leo XIII. was encouraged by the duke of Norfolk and other distinguished Roman Catholic laymen to make Newman a cardinal, the distinction being a marked one, because he was a simple priest and not resident in Rome. The offer was made in Feb. 1879, and the announcement of it was received with universal applause throughout the English-speaking world. The "creation" took place on May 12, with the title of St. George in Velabro, Newman taking occasion while in Rome to insist on the lifelong consistency of his opposition to "liberalism in religion." After an illness that excited apprehension he returned to England, and thenceforward resided at the Oratory until his death, Aug. 11, 1890, making occasional visits to London, and chiefly to his old friend, R. W. Church, dean of St. Paul's, who as proctor had vetoed the condemnation of *Tract 90* in 1841.

Personality.—Newman's influence as controversialist and preacher was very great. Although he never called himself a mystic, he showed that, in his judgment, spiritual truth is apprehended by direct intuition, as an antecedent necessity to the professedly purely rational basis of the Roman Catholic creed. Within the Anglican Church, and even within the more strictly Protestant Churches, his influence was greater, but in a different direction, viz., in showing the necessity of dogma and the indispensableness of the austere, ascetic, chastened and graver side of the Christian religion. If his teaching as to the Church was less widely followed, it was because of doubts as to the thoroughness of his knowledge of history and as to his freedom from bias as a critic. Some hundreds of clergymen, influenced by the movement of which for ten or twelve years he was the acknowledged leader, made their submission to the Church of Rome. The natural tendency of his mind is often (and correctly) spoken of as sceptical. He held that, apart from an interior and unreasoned conviction, there is no cogent proof of the existence of God; and in *Tract 85* he dealt with the difficulties of the Creed and of the canon of Scripture, with apparent implication that they are insurmountable unless overridden by the authority of an infallible Church. In his own case these views did not lead to scepticism, because he had always possessed the necessary interior conviction.

He was a man of magnetic personality, with an intense belief in the significance of his own career; and his character may be described as feminine, both in its strength and in its weakness. As a poet he had inspiration and genuine power. "The Dream of Gerontius," is generally recognized as a masterpiece. His prose style is fresh and vigorous.

There is at Oxford a bust of Newman by Woolner. His portrait by Oulless is at the Birmingham Oratory, and his portrait by Millais is in the possession of the duke of Norfolk, a replica being at the London Oratory. Outside the latter building, facing Brompton road, is a marble statue of Newman as cardinal.

BIBLIOGRAPHY.—The chief authorities for Newman's life are his *Apologia* and the *Letters and Correspondence* edited by Miss Mozley, above referred to. The letters and memoranda dealing with the years 1845–90 were entrusted by Newman to the Rev. W. Neville as literary executor. T. Mozley, *Reminiscences chiefly of Oriel College, and the Oxford Movement*, 2 vol. (1882); R. W. Church, *The Oxford Movement, Twelve Years, 1833–1845* (1891); R. H. Hutton, *Cardinal Newman* (1891); W. P. Ward, *The Life of John Henry Cardinal Newman*, 2 vol. (1912; 3rd ed., 1927), should also be consulted. Adverse criticism will be found in the writings of E. A. Abbott (e.g., *The Anglican Career of Cardinal Newman*, 1892). See also *Cardinal Newman's Works*, 40 vol. (with index by J. Rickaby, 1874–1921); P. Thureau-Dangin, *La Renaissance Catholique en Angleterre au XIX^e siècle*, 3 pt. (1899–1906; trans. and rev. by W. Wilberforce, 2 vol., 1914); L. Félix Faure, *Newman, Sa vie et ses oeuvres* (1901); G. Grappe, *J. H. Newman, Essai de psychologie religieuse* (1902); C. J. Blennerhasset, *John Henry Cardinal Newman* (1904); W. Barry, *Cardinal Newman* (1904; rev. ed., 1927); H. Brémond, *Newman*, 3 vol. (1905–06); N. J. D. White, *John Henry Newman* (1925); B. Newman, *Cardinal Newman, A Biographical and Literary Study* (1925); J. J. Reilly, *Newman as a Man of Letters* (1925); J. D. Folkhera, *Newman Apologiste* (1927); trans. by P. Hereford as *Newman's Apologetic* (1929). (A. W. HÜ.)

NEWMARCH, WILLIAM (1820–1882), English economist and statistician, was born at Thirsk, Yorkshire, on Jan. 28, 1820. He was secretary of the Globe Insurance Company (1851–62), and chief officer in the banking-house of Glyn, Mills and Co., (1862–81). He was one of the honorary secretaries, editor of its journal, and in 1869–71 president of the Royal Statistical Society and a fellow of the Royal Society. Newmarch died at Torquay on March 23, 1882. After his death his friends founded in his memory, a Newmarch lectureship in economic science at University college, London.

He was the author of an essay, published in 1855, *On the Loans raised by Mr. Pitt during the first French War, 1793–1801, with some statements in defence of the Methods of Funding employed*.

NEWMARKET, a market town of Cambridgeshire, England, 13½ m. E. by N. of Cambridge, on the Bury branch of the L.N.E. railway. Pop. of urban district (1921), 9,767. A part of the town is in Suffolk, and the urban district is in the administrative county of West Suffolk. Newmarket has been celebrated for its horse-races from the time of James I., though at that time there was more of coursing and hawking than horse-racing. Charles I. instituted the first cup race here. The race-course, which lies south-west of the town, has a full extent of 4 m., but is divided into different lengths to suit various races. It intersects the Devil's Ditch or Dyke (sometimes also known as St. Edmund's Dyke) an earthwork consisting of a ditch and mound about 7½ m. long. It starts south-east of the Swaffham-Burwell road, and the ditch has a depth of 15 ft., the slope from the top of the dyke to the bottom of the ditch measures 62 ft., while the overall breadth of dyke and ditch is 37 yards. From negative evidence it is surmised that it belongs to the Iron age, and that the builders were the Icenii. Roman remains have been found in the neighbourhood, and in later times the dyke formed part of the boundary of East Anglia. (See C. Fox, *Archaeology of the Cambridge Region*, 1923.)

NEW MEXICO, popularly known as the "Sunshine" State, is situated in the south-western part of the United States between 31° 20' and 37° N. lat., and 103° and 109° W. longitude. It is bounded north by Colorado; east by Oklahoma and Texas; south by Texas and the republic of Mexico; and west by Arizona. It has an extreme length north and south of 400 m., and extreme width east and west of 358 m. and a total area of 122,634 sq.m., of which 131 sq.m. are water surface.

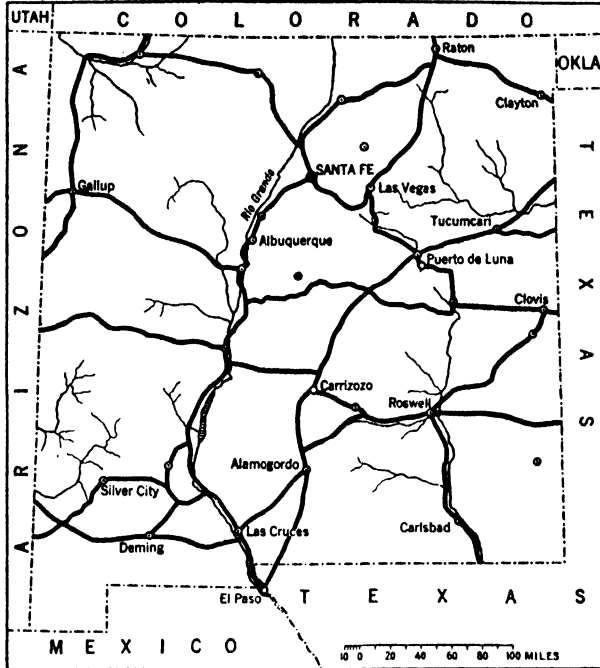

Physical Features.—The borders of the State are characterized by high plateaux cut by deep canyons, while in the central part faulted mountains surround comparatively level areas filled with alluvial deposits. Between the Rio Grande and the Staked plains the mountains form a more continuous range than on the west side of the river where the elevated areas form the main continental divide. The Sangre de Cristo mass is a part of the Colorado mountains which extend into New Mexico slightly east of the north-central part of the State and east of the Rio Grande. South of this northern mass two series of ridges extend to the southern boundary: the one near the Rio Grande, called in places from north to south the Sandia, the Manzano, the San Andrés, the Oscura and the Organ mountains; while the eastern group consists of the Hills of Pedernal, the White, the Sacramento and the Guadalupe mountains.

On the west side of the Rio Grande the San Juan mountains dominate the country north of the Chama river. A second somewhat smaller mass lies between the Chama and the Jemez river, the Jemez mountains. Across the Puerco the Mount Taylor mountains carry the main divide in a south-western direction to the Chusca and Zufri mountains, which are continued farther south in one of the largest mountain masses of the State, the Mogollons, with the San Mateo and the Magdalena as outlying ridges in the direction of the Rio Grande, and the Black Range forming the south-eastern part. In the extreme south-western part of the State the western mountains terminate in several parallel ridges; the Burro, the Pyramid, the Big Hatchet and the Peloncillo mountains.

The major divides following the tops of the ranges and high plateaux run generally north and south. Of the most important

there may be mentioned the divides between the Pecos and the Canadian valleys; between the Pecos and Tularosa valleys; between the Tularosa and the Rio Grande; and between the Rio Grande and the San Juan, Little Colorado and Gila valleys.

The rivers are the only important bodies of water that make up a part of the physiography of the State. In the north-eastern part of the State, in Union county, two of the branches of the

MAP SHOWING THE MAIN ROADS IN NEW MEXICO

Arkansas river have their sources. These are the Cimarron and the North Canadian rivers. A third branch of the Arkansas, the Canadian, flows through Colfax, Mora, San Miguel and Quay counties. As the Canadian drains the eastern part of the Sangre de Cristo Range, so the Pecos river receives the water from the southern part of the range and flows in a southerly direction across the State. The Rio Grande is the only important river in New Mexico that does not have its source within the State. It enters New Mexico in a deep canyon a short distance to the east of the 106 meridian, and flows south through the centre of the State. On the western side of the continental divide the principal rivers are the San Juan, Little Colorado and Gila, tributaries of the Colorado which flows to the Gulf of California.

The principal characteristics of the arid soils of New Mexico are: a large amount of mineral matter; a small amount of organic matter; deep soils; and a marked degree of productivity when irrigated.

Climate.—The winter rainy season is created by comparatively dry westerly winds blowing from the Pacific, coming into New Mexico from the north-east and north-west. In the summer the place of these winds is taken by a monsoon wind from the south, south-west or south-east. When they reach the mountainous districts of New Mexico they are cooled. This results in giving New Mexico a summer period of sub-tropical monsoon rains. The average rainfall for the State is about 15 in. annually. On some sections of the southern plains it is as low as 6 in. while in the mountain districts of the north it rises to 25 or 30 inches. The skies are generally clear and sunshine is abundant; the days are warm but the nights are cool. At Santa Fe, where the mountains and plains meet, the mean annual temperature is 48.8° F; the mean for the winter is 30.9° and for the summer 67°; and the highest and lowest temperatures ever were 97° and -13°.

Flora and Fauna.—The physiographical conditions of New Mexico determine, in a measure, the distribution of plants and animals. Six life zones are represented in the State, due to vari-

ation in altitude which is a striking characteristic of mountainous areas. The Lower Sonoran is the zone of mesquite, occupying the valleys of the southern part of the State. For agricultural purposes it is the most important of the zones, due to the long growing period and the high temperatures. The woody plants of this region include the creosote bush, the Spanish bayonet, the screw bean, the desert willow, and valley cottonwood. Cactuses in a variety of species are a part of the flora of this zone.

Among the mammals there are a number of species of rats, mice, squirrels, rabbits, skunks and bats. There are also the jaguar, the New Mexico desert fox, the Mearns coyote, the Mexican badger and the New Mexico weasel. The birds are numerous.

The Upper Sonoran, the largest of the zones, ranks first in economic wealth. It embraces the grazing lands that include about three-fourths of the State, or 92,000 square miles. The grasses that give this zone its value are the grama, the galleta, buffalo and porcupine. Several species of deer, coyotes, antelopes, wolves, prairie dogs and mountain sheep are common to the area.

The Transition zone, covering about 10,000 sq. m., is the section of the State important for timber. Very little agriculture is carried on, but there is good range for stock. The Merriam elk, Rocky mountain lion, Mexican mountain lion, the mountain bobcat, mountain coyote, Mexican wolf, black bear, grizzly bear, otter and mink are found in this zone.

The Canadian zone is about one-fifth the size of the Transition. Its importance lies in the water-supply that it stores for the regions of lower altitude. Its lowest parts on the cold slopes are at an altitude of 8,500 feet. The trees found are the Bristol cone pine, the western white pine, Douglas spruce and the balsam.

The Hudsonian is a very narrow zone along the timber line on the upper slopes of the high mountains with an area of 300 square miles. The trees and shrubs include the Siberian juniper, Englemann's fir, Parry's fir, several species of currants and sedges. The mammals are few, being mountain sheep, Rocky Mountain woodchuck, the grey and dusky rock cony.

The Arctic-Alpine is the smallest of the life zone represented in New Mexico. The area is above the timber line, at about 12,500 feet. Among the plants are the Colorado poppy, several species of saxifrages, sedges and rushes, the dwarfed closed gentian, alpine larkspur, alpine sagebrush. Few mammals enter the region.

Population.—The Indians of New Mexico constitute an interesting part of the population. They consist of two types: the nomadic Indians who have been settled on reservations by the U. S. Government; and the Pueblo Indians, who live a communal life which was well established long before the Spanish came to the New World. There are 18 subdivisions of the latter group living mainly in the Rio Grande valley. The social system is based upon the family as the main unit, dominated by the mother who is the owner of the home. The total Indian population of the State in 1910 was 20,573 and in 1920, 19,512. The Navajo number about 9,000; the Apache, 1,000; and the Pueblos, 9,000.

The largest Pueblo community is Zuni which had a population of 1,667 in 1910. The census of 1910 gave two others a population of over 1,000; Laguna, 1,472 and Isleta, 1,000. The total population of the State has increased from 160,282 in 1890 to 360,350 in 1920. The 1928 estimate of the U. S. Census Bureau was

DENSITY OF POPULATION, 1920, COMPARED WITH AVERAGE FOR U. S.

396,000. The decade from 1900 to 1910 witnessed the greatest increase, from 195,310 to 327,301, or 67.6%. A total of 47,942 in 1920 were foreign-born or of foreign parentage. Of this number 19,906 were Mexicans, the majority of whom belonged to the lower or "peon" class; a mixture of Indian and Spanish blood. The negroes have increased from 1,628, in 1910 to 5,733 in 1920. A sprinkling of Japanese and Chinese constitute the other non-white element in the State. The State Constitution provides that laws shall be published in both English and Spanish, and no citizen can be deprived of the right to sit on juries or to hold office

because he cannot speak English. The dual language situation has presented a difficult problem for the schools, but every pupil is required to learn English by which it is hoped to solve it for the future. Albuquerque is the largest city, having an estimated population of 27,000 in 1925. The capital city, Santa Fe, had 7,239 inhabitants in 1920.

Government.—With slight amendments the Constitution adopted in 1911 remains the basis of the State Government. Amendments may be proposed by a majority of the members in each house and must then be voted upon by the people at the next general election or a special election called not less than six months after adjournment of the legislature.

The State legislature is composed of a senate and house of representatives having 24 and 49 members respectively in 1927. Regular sessions are held in odd-numbered years, beginning the second Tuesday in January, and are restricted in length to 60 days. Special sessions not to last over 30 days may be called by the governor but must confine their business to specific matters mentioned in the governor's proclamation. Representatives are elected for two years and senators for four years, the latter, contrary to the practice in most States, being all elected at one time. The governor possesses a veto power which can be overridden by a two-thirds vote of the legislative members present and voting in each house. The people of New Mexico possess the referendum privilege but not the power of initiative. In the National Congress the State is represented by two senators and one representative.

The Constitution provides for 11 elective administrative officers, namely, governor, lieutenant governor, secretary of State, auditor, treasurer, attorney general, commissioner of public lands and three corporation commissioners, all serving two years. They may succeed themselves for one term but are not afterwards eligible for re-election until a two year period has elapsed, except the lieutenant governor who may succeed himself indefinitely. The number of elective officers seriously limits the governor's control over his administration.

A supreme court holds one session a year, which lasts as long as the justices think proper, trying cases appealed from the lower courts. There are three supreme court justices elected one at a time for terms of eight years each. There are nine district courts holding two regular sessions each year at the county seat. The district judge is elected for six years. There are probate courts in each county and justices of the peace in each precinct.

Finance.—The value of all tangible property in New Mexico was estimated in 1922 at \$852,000,000 or \$2,299 per caput. The total taxes levied by State, county, town and school district governments the same year amounted to \$8,805,000 or \$23.89 per caput. Their per caput rate was lower than any other Western State, the next lowest being \$37.82 in Utah. Revenues of the State Government amounted in 1925 to \$7,908,000, of which but \$1,713,000 was derived from taxation. Public lands, motor licences, a gasoline tax of five cents a gallon, and Federal road aid supplied most of the remainder. Expenditures amounted to \$8,634,000 of which \$4,240,000 was for current and maintenance expenses and \$4,577,000 for permanent improvements. The State bonded indebtedness on June 30, 1926 was \$3,919,500, a decrease of over \$1,000,000 from that of 1922.

In the same year there were 63 banks in the State (31 of them national banks) with resources and liabilities totalling \$39,213,000.

Education.—Previous to 1891 when the general public school system of New Mexico was established, education was carried on mainly by private and religious agencies which established mission schools and academies. These are still numerous. There were in 1924-25 42 private and parochial schools of elementary standing with 5,879 pupils enrolled. Progress in the public school system was slow from 1891 until 1911 when Statehood was granted, but has been rapid since as is shown by the increase in expenditures for public schools from \$793,000 in 1910 to \$4,835,000 in 1925.

The governing authority of the public school system is the State board of education consisting of the governor, the superintendent of public instruction, who is elected for two years, and five members, who are appointed by the governor. The school

population of the State in the year 1924-25 numbered 120,114 of which 92,615 was enrolled in public schools. The average daily attendance was 63,241. There were 61 public and 10 private high schools with 250 teachers and 6,301 pupils. There were in the entire public school system 2,011 teachers in rural districts and 1,083 in city districts.

The University of New Mexico, with its distinctive buildings in the Indian Pueblo type of architecture is situated on a mesa

PROPORTION OF ILLITERATES AMONG THE NATIVE WHITE, THE FOREIGN-BORN WHITE, AND THE NEGROES, 1920

about a mile from and overlooking the city of Albuquerque. Its attendance increased from 235 in 1915 to 990 in 1928, its faculty members from 21 to 54 and its buildings from 8 to 17 in number. The State School of Mines, located at Socorro, had an enrolment of 76 students and a teaching staff of 11 members in 1925. The College of Agriculture and Mechanic Arts near Las Cruces, in the fertile Mesilla valley had a staff of 39 members and an enrolment of 287 students. The New Mexico agricultural experiment station is a part of the institution. The New Mexico Military institute, a school of high rating, at Roswell is also supported in part by State funds. It offers a course of work covering the four years of high school and first two years of college. The New Mexico Normal university at Las Vegas contains a training school, a high school department and a four year normal department. Similar in organization is the New Mexico Teachers' college at Silver City. At El Rito is a Spanish-American normal school designed to instruct teachers for the Spanish districts.

Charities and Corrections.—The State penitentiary, located at Santa Fe, was established in 1882. A State reform school was established at Springer in 1909. A girls' welfare board, created in 1919, established a home in Albuquerque for girls under 18. The charitable institutions include the asylum for the insane at Las Vegas, a miner's hospital at Raton, the asylum for the deaf and dumb at Santa Fe and the institute for the blind at Alamogordo. In 1884 the Territorial legislature adopted the Asylum of the Sisters of Charity at Santa Fe as the State orphan's home, with little change in its organization.

Agriculture and Live Stock.—The eastern one-third of the State and especially the north-eastern counties contain the most important crop-producing districts. In Curry, Roosevelt, Quay, Harding, Union and Colfax counties an average rainfall of 15.5 in. (1914-24) permits of considerable dry farming, while over the rest of the State crops are dependent almost entirely upon irrigation and confined to those river valleys where it is practicable. Though 27,859,325 ac. or a little more than one-third of the State was owned as farm land in 1925 (an increase over 11,270,021 ac. in 1910 and 24,409,633 ac. in 1920) only 1,784,851 ac. were crop land. There were in 1925 31,687 farms, valued, together with all farm property, at \$236,300,000. The 1920 valuation was \$325,185,000.

The river basins containing irrigated lands are the Rio Grande, Pecos, Canadian, San Juan and Gila with their tributaries and the Cimarron, Rio Mimbres, Rio Tularosa, Trincheras and Fresno. The area capable of irrigation under existing projects amounted to 644,970 ac. in 1910 and 696,119 ac. in 1919. In the latter year 233,893 ac. were harvested with a crop valued at \$11,400,144 or \$48.74 per acre. The cost of irrigation operation and maintenance averaged \$2.41 per acre. The Carlisbad project in the Pecos valley is a prosperous achievement of the U. S. Reclama-

tion Service. Another Federal undertaking of greater extent is the Rio Grande project of 150,000 ac. shared by New Mexico, Mexico and Texas which was constructed at a cost of \$14,071,706.

The estimated value of all crops in 1926 was \$33,800,000 as compared with \$28,600,000 in 1925 and \$40,000,000 in 1924. Chief in value in 1926 was wheat, reaching \$6,242,000. Hay was next to wheat, and much more evenly distributed over the State. The tame hay crop in 1926 amounted to 435,000 tons, the wild crop to 33,000 tons. Approximately three-fourths of the tame crop was alfalfa to which 121,000 ac. were devoted. The cotton crop, valued at \$7,560,000 in 1925, declined in 1926 to \$5,004,000. Corn in 1926 was valued at \$3,845,000 and was well distributed over all irrigated areas. Sorghum in 1926 was valued at \$1,047,000. The bean crop of 1925 was valued at \$1,317,000 and of 1926 at \$2,179,000. Minor crops and their valuations in 1926 were: potatoes, \$290,000; barley, \$135,000; and broom corn, \$246,000. Apples to the number of 1,147,000 bu. were raised in 1926; also 131,000 bu. of peaches.

Live stock on New Mexico ranches and farms amounted in value in 1910 to \$43,494,679; 1920 to \$93,626,000; 1925 to \$52,671,000. The decrease in 1925 from the 1920 valuation represents not a decline in numbers, which remained about stationary, but in price. There were in 1927, 166,000 horses valued at \$5,586,000; 34,000 mules valued at \$1,500,000; 1,189,000 cattle valued at \$36,887,000 and 2,490,000 sheep valued at \$21,789,000. Cattle, though decreasing slightly in number, showed an appreciation in value of over \$8,000,000 between 1925 and 1927. Dairying, while a growing industry, is not important in New Mexico, there being but 39,383 milch cows in 1925. The major portion of the cattle are still raised on large ranches for beef purposes. Ranches average from 60 to 80 sections in size but very little of the land (10% to 25%) is owned by the rancher himself. About half is leased from the National Forest Service, from private owners (often homesteaders who have failed), or from the railways or the State. In the south-western counties about 25% is public domain, and in the south-central counties about 40%. From 1922 to 1925 New Mexico shipped an average of 531,600 cattle annually. The value of sheep increased from \$8,124,000 in 1922 to \$21,789,000 in 1927. Sheep are raised all over New Mexico, but are more numerous in the southern and western parts of the State, while the north-western counties are sheep territory almost exclusively. From 1922 to 1925 inclusive an average of 588,610 sheep were annually shipped from the State. The wool output of 1926 totalled 12,060,000 lb., valued at \$3,630,000, but the average weight of a fleece was but 5.9 lb. compared with a 7.8 lb. average for the entire United States.

Mining.—Though New Mexico was once an important silver-producing State, the 20th century brought an increased demand for the baser metals, especially copper, zinc and lead, and capital was drawn to their production. Showing a steady increase in output and value after the depression of 1921 copper became the leading mineral in 1925, its production amounting to 76,427,825 lb. valued at \$10,852,751. The estimate for 1926 amounted to 82,600,000 lb. valued approximately at \$11,300,000. About 99% of the copper is mined in Grant and Hidalgo, chiefly from the Chino Copper Company's operations in the Central district and from the 85 mines in the Lordsburg district. Zinc production increased from 9,246 tons in 1925 to 12,100 tons in 1926—the 1925 valuation amounting to \$1,405,415. Lead also showed a rapid increase from \$290,761 in value in 1924 to \$654,000 in 1926. The silver and gold mined in 1925 amounted in value to \$510,176 and \$549,073 respectively.

Rivalling copper closely for the leadership among mineral products is coal. In 1925 2,556,851 tons valued at \$8,611,000 were produced. Coal areas cover approximately 15,000 sq.m. and are hardly touched as yet. Good bituminous deposits are found at White Oaks, Carthage, Abbey, Cerrillos, Raton, Van Houten and Dawson. Activities in the petroleum field resulted in a leap in production from 98,000 bbl. in 1924 to 1,060,000 bbl. in 1925 and in value from \$127,000 to \$1,815,000. The output for 1926 was estimated at 1,627,000 barrels.

New Mexico is generously endowed with beautiful stone suit-

able for building purposes.

Manufactures.—As New Mexico is primarily a mining and stock-raising region, its manufacturing industries, though growing, are still of comparatively little importance. The value of the products of manufacturing establishments increased from \$9,320,000 in 1914 to \$20,422,126 in 1923, or 119%, but dropped to \$19,458,585 in 1925. Of the latter figure \$9,954,204 was added by the manufacturing process. There were in 1925 200 establishments, paying \$5,083,211 in wages to 4,629 wage earners. Albuquerque with 28 establishments and 1,317 workers turning out products valued at \$5,016,303 was the main manufacturing centre. The chief industries were car construction and repair shops together with railway repair shops, \$5,842,735; lumber and timber products, \$5,752,649.

Transportation.—In 1925 there were 2,998 m. of railway in New Mexico. About one-half belonged to the Atchison, Topeka and Santa Fe system, whose trans-continental line crosses the northern one-third of the State. Another transcontinental line, the Southern Pacific, crosses the southern part of New Mexico westward from El Paso, Texas. The rural highway system totals in all 48,295 m. of which 2,441 m. were surfaced in 1926. The State highway system, which includes all the principal through routes, totals 9,214 m. of which 1,685 m. were surfaced in 1926. Expenditures by the State for highways amounting to about \$3,500,000 annually from 1921 to 1925, were derived largely from motor vehicle and gasoline taxes and Federal aid.

History.—In the period 1525-43 explorations extending from Florida to the California coast paved the way for the later colonization of Florida and New Mexico in the latter part of the 16th century, Texas in the early part of the 18th and California in the latter part of that century. The first of the expeditions was that of Narváez. The journey of the treasurer of this Florida adventure, Cabeza de Vaca, extended over the period from 1528 to 1536.

The appointment of Antonio de Mendoza as first viceroy of New Spain in 1535 marked the beginning of a period of improved organization in the continental possessions of Spain. Early in 1539 Friar Marcos de Niza was chosen by the viceroy to investigate the land north of Culiacán and inaugurate a new policy in Indian affairs. When Friar Marcos left Culiacán, March 1539, he was accompanied by Estevánico, as guide, who was one of

BY COURTESY OF THE BUREAU OF RECLAMATION

EXTERIOR VIEW OF TAOS, SHOWING ONE OF THE TWO SIX-STORYED PUEBLOS AND THE LADDERS BY WHICH IT IS ENTERED

the four survivors of the Narváez expedition. The party reached the vicinity of the Zuñi pueblos, in the western part of New Mexico. In the following year the well-equipped expedition of 270 soldiers under Coronado arrived by the same trail. The Zuñi pueblos were conquered and the expedition established winter headquarters near the present town of Bernalillo. The Grand Canyon of the Colorado was discovered and other parties explored the Rio Grande valley and the country as far east as the present State of Kansas.

An expedition was organized by the Franciscan friar, Augustín

Rodríguez in the summer of 1581 for the purpose of converting the Indians of the lands to the north of Mexico. A year later Antonio de Espejo led an expedition to rescue the friars of the Rodríguez party, who had remained in New Mexico without protection after the return of their military escort to Mexico. (The name New Mexico seems to have been applied to the Pueblos of the Rio Grande valley in the summer of 1582, although the name applied by the members of the Rodríguez expedition, San Felipe, and the name given by Espejo, Nueva Andalucía, were probably sometimes used.) Near the close of the century a contract was made with Juan de Oñate for the colonization of New Mexico. The expedition was assembled in the vicinity of Santa Bárbara in August 1597, and after several delays proceeded up the Rio Grande. The first settlement was made at San Juan de los Caballeros in the Chama river valley, July 11, 1598. The construction of the first church in New Mexico was completed and mass was celebrated on Sept. 9, 1598. The present capital of New Mexico, Santa Fe, was founded in 1609.

New Mexico remained a frontier mission field during the 17th century. Twenty friars were serving by 1624; the churches numbered 43; and the number of Christian Indians 34,000. The total Spanish population at the end of the century was only 2,000, which shows that the colony had not become an important source of wealth. The differences between the Indian culture and the Spanish European manner of life were the principal causes of the revolt of the Pueblos in 1680. The Pueblo Indians were willing to accept the God of the Christians as an additional protecting power, but they could not give up their own beliefs concerning the spirits of the universe without completely destroying their organized tribal life, because every phase of their existence is affected by their conceptions of the relation of the tribe to the world. The Spanish settlers abandoned their holdings and retreated southward to El Paso. Diego de Vargas effected a reconquest of the province between 1692 and 1696. Albuquerque was founded in 1706 and by 1799 had a population of 4,020. The total population of the province at the close of the 18th century was about 30,000; 20,000 Spanish and 10,000 Indians.

The internal affairs of New Mexico prior to 1821 were not affected to any great degree by the revolutionary developments which took place during this period in Spain and Mexico. New Mexico became a political subdivision of the Mexican Republic; granted independence from Spain by the Treaty of Córdoba, Aug. 24, 1821. Trade with the American settlements in the Missouri valley, which had been discouraged during the Spanish régime, was legalized in 1821. An annual caravan set out from Missouri in the spring of the year. The value of the merchandise carried on the outward journey increased from \$15,000 in 1822 to \$450,000 in 1843. The Santa Fe trade was a success because merchandise could be freighted across the plains to the markets of New Mexico and sold for a lower price than goods could be brought from Vera Cruz by way of Chihuahua.

The Republic of Texas claimed the Rio Grande as its western boundary. The prosperous Santa Fe trade, which would be a rich source of taxation, encouraged Texas to assert this claim. An expedition was organized in 1841 which arrived in New Mexico in a disorganized condition and surrendered to Governor Armijo at Anton Chico. A second expedition in 1843 also failed.

Upon the outbreak of war with Mexico the army of the West under command of Col. Stephen Watts Kearny, occupied Las Vegas Aug. 15, 1846 and took formal possession of the country. The capital was occupied three days later and a military government was established which ruled the territory for five years. The civil government was retained for two years during which period a rebellion broke out resulting in the assassination of Governor Bent at Taos, on Jan. 19, 1847. The Territory of New Mexico was created by act of Congress, Sept. 9, 1850, extending from the 103 meridian of longitude on the east to the Territory of California on the west. The present boundaries were fixed by 1863 with the formation of the Territory of Arizona from the western half, and the Territory of Colorado from a northern portion two years earlier.

At the outbreak of the Civil War the Territory was invaded by a Confederate force, under command of Brig.-gen. H. H. Sibley, which marched up the Rio Grande valley and occupied the capital. The Union army under command of Col. E. R. S. Canby, with reinforcements from Colorado, won the decisive battle of the campaign at Apache canyon, on March 28, 1862. The period following the American occupation was marked by the solution

BY COURTESY OF THE ATCHISON, TOPEKA AND SANTA FE RAILROAD
THE STATE ART MUSEUM AT SANTA FE

of the nomadic Indian problem and the economic development of the territory. A reservation was established in 1868 for the Navajo Indians in the north-western part of the Territory; the Mescalero Apache were settled in the southern part of the Territory in 1873; and the Jicarilla Apache in the northern part in 1880. The legal status of the Pueblo Indian was complicated by the Treaty of Guadalupe Hidalgo and later decisions of the U.S. Supreme Court.

The building of railways into the West, the increasing population, and the quieting of the Indians resulted in a great increase in cattle and sheep. The overflowing cattle herds of Texas were used to stock the ranges in New Mexico and the States to the north. The Goodnight-Chisom trail up the Pecos valley was followed by the overland drives to the ranges in Colorado and Wyoming; and to the railway shipping points in Kansas. Conflicts occurred between the cattle and sheep raisers over water and the use of the open range. The most bitter of these was the Lincoln county war which started in 1877 and lasted about three years. The Atchison, Topeka and Santa Fe railway was extended to Albuquerque in 1880. A year later connection was made with the Southern Pacific railway at Deming, which placed the Territory on a transcontinental line. With the advent of the railways mining and irrigation developed; the population increased and a public school system was established in 1891.

The Spanish and Mexican land grants in New Mexico have constituted one of the most difficult land problems in the history of the State. The Treaty of Guadalupe Hidalgo confirmed the grants but the lack of accurate documents complicated the problem of settling conflicting claims. The establishment of the U.S. court of private land claims, March 3, 1891, was the beginning of a policy of settling titles by means of court proceedings.

Constant efforts were made to secure Statehood. The Enabling Act was passed by Congress on June 20, 1900. A Constitution, drawn up by the people, was accepted by Congress and signed by the president on Aug. 21, 1911. The State was formally admitted on Jan. 6, 1912.

NEWNAN, a city of western Georgia, U.S.A., the county seat of Coweta county; on Federal highway 29, 40 m. S.W. of Atlanta. It is served by the Atlanta and West Point and the Central of Georgia railways. Pop. 7,037 in 1920 (44% negroes). It is a shipping point for cotton, bright-leaf tobacco, corn, peanuts, garden truck, hogs, cattle and poultry.

NEW ORLEANS, a city of Louisiana, U.S.A., situated on the east bank of the Mississippi river about 107 m. from its mouth. It was originally on a bend in the river and from that fact its popular name, "Crescent City," was derived.

Physical Features.—The soil is an alluvial deposit from the river and, therefore, has its greatest elevation at the river bank, where the ground behind the levees is from 10 to 15 ft. above the mean level of the Gulf of Mexico; but the lower parts of the city are below gulf level. Built on the narrow ridge of land at the river bank, the growing city first expanded along the river front and later, the cypress swamps between the river and Lake Pontchartrain having been cleared and drained, covered a distance of from 4.5 to 7.3 miles. The river approaches New Orleans flowing eastward, turns rather abruptly to the south at the upper municipal limits, then eastward as it passes the modern city, and finally northward in one of the sharpest bends to be found in the lower river, near the site of the original city, or *vieux carré*.

The difficulties involved in building a city on such a site as that of New Orleans were great. Drainage, sanitation and a satisfactory water supply were realized nearly two centuries after the establishment of the first settlement, and in the interim yellow fever and cholera took frightful tolls. Modern engineering

summers are uniformly warm but extreme heat is unknown, and the highest temperature recorded by the weather bureau is 102° F, while a temperature of 100° F is seldom reached, owing to the cool breezes from the Gulf of Mexico. Mean temperature is:—

January	54.5°	July	82.4°
February	57.2°	August	82.3°
March	63.0°	September	79.4°
April	68.9°	October	70.4°
May	75.2°	November	61.9°
June	80.9°	December	55.7°
Yearly average			69.3°

The rainfall averages 56.77 in., well distributed through the year.

Population.—The population of New Orleans was 339,075 in 1910 and 387,219 in 1920. On July 1, 1928, it was approximately 429,400 of which nearly 75% were white and the rest preponderantly negroes. Every country of Europe is represented. Among the foreign-born the Italians are the most numerous; other nationalities of great numerical strength are Irish, Germans, English and French. The French, because of the creole element, feel perfectly at home, speaking their own language, and living among sympathetic surroundings. The creoles are the descendants of the French and Spanish settlers of Louisiana. When the city passed under the American flag the Americans built up a quarter for themselves, up stream from the *vieux carré*, the upper boundary of which was Canal street. The line is not as strictly drawn now as in earlier years, as many creoles have settled in the newer portions of the city and some Americans have moved to the French quarter. This change has been more pronounced in the third decade of the 20th century during which time a lively interest in the old quarter has developed into a movement to preserve those buildings and other historical sites of the city.

Water Supply, Drainage and Sewerage.—The entire city, except for its levees, is below the river high water mark while a large portion of it is below that of Lake Pontchartrain. Combined with these difficulties New Orleans has heavy rainfall; occasionally over 3 in. in one hour, 7 in. in 5 hours and 9 in. in 12 hours, having been experienced. As a result of the occasional excessive rainfalls, it has been necessary to provide large canal systems to convey the water to and from the pumping plants, and eight pumping stations for the removal of storm water have been built. A number of these drainage canals are built of reinforced concrete, lined and covered with masonry and are often under the roadway of streets; some of the open canals are lined with creosoted timber. The largest of the concrete canals are 25 ft. or more in width and when running full, have 9 ft. or more depth of water. To keep the water moving in these canals the city has an aggregation of low lift pumps with a capacity of over 7,000,000,000 gal. per day.

The sewage of the city is collected separately from the drainage and is finally discharged into the Mississippi, where the dilution is so great that it is not noticeable further down stream. Like the drainage, the sewage has to be pumped, much of it through two or more lifts, and this is accomplished by electric pumping stations operating automatically.

In the early days of the colony the turbid water from the Mississippi was carried from the river and settled in large earthen jars. Wells were used to supply water for household purposes but not for human consumption. In 1810, a first attempt was made to establish waterworks. In 1833 the Commercial Bank was organized for the purpose of establishing waterworks in New Orleans and iron pipes replaced the early wooden ones. In 1869 the city bought the system from the company, issuing bonds for that purpose; but lack of funds and bad management obliged the city in 1877 to give a monopoly to the New Orleans Water-Works company. The river water was too muddy to be useful for most purposes and cisterns were preferred, although a time of drought often caused scant supply. To solve the problems involved and to study the methods of treatment for purification of the river water, an experimental plant was established in 1900, and a process adopted for softening by the use of lime and small amounts of sulphate of iron, producing a coagulation whereby the fine clay particles are brought together into large masses that will settle out in a few hours, or which are large enough to be

WEATHER GRAPH OF NEW ORLEANS. THE THERMOMETER INDICATES THE NORMAL ANNUAL MEAN TEMPERATURE. THE MIDDLE CURVE SHOWS THE NORMAL MONTHLY MEAN TEMPERATURE. THE CURVES ABOVE AND BELOW THE HIGHEST AND LOWEST EVER RECORDED IN EACH MONTH. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION

and sanitation finally triumphed, and to-day New Orleans is one of the healthiest cities of the world.

The boundaries of the parish of Orleans and the city of New Orleans are the same, embracing an area of 196 sq. miles. The boundary line is very irregular, but may be given approximately as Lake Pontchartrain on the north, the Rigolets and Lake Borgne on the east, the parish of St. Bernard and the Mississippi river on the south, and Jefferson parish on the west. The city gradually expanded by spreading along the higher lands near the river bank.

New Orleans is noted for its mild and balmy winters; the

completely removed by the filters. By this process, first put into operation in 1909, New Orleans has had continuously an abundant supply of clear, pure water of the highest quality. Additions to the water purification plant, nearly completed in 1928, will increase the capacity to 112,000,000 gal. per day, and, if necessary, to 160,000,000.

Streets, Bridges and Parks.—The streets of the *vieux carré*, or old French city, are narrow, but in the newer portions there are many wide avenues and boulevards, some of which were originally canals. Some of the avenues, such as St. Charles, Esplanade, Claiborne and others, were originally laid out with sufficient width for a street on each side, accommodating traffic in both directions and with a "neutral ground" between which has been used for street car tracks and planted with trees.

New Orleans is situated on the Old Spanish Trail which extends from San Diego, Calif., to St. Augustine, Fla. It is at the southern end of the Jefferson highway which runs to Winnipeg, and the Colonial highway which leads to New York. The Jackson and Mississippi Valley highways lead to points in the Middle West and the Mississippi valley. Early in the year 1928 the New Orleans-Pontchartrain bridge was opened to traffic. This concrete structure is nearly 25,000 ft. in length and was built by a private corporation at a cost of \$5,500,000.

New Orleans is well supplied with parks. Audubon park, with 234 ac., is situated in the upper portion of the city and contains a statue of Audubon. City park on City Park avenue has recently been increased to 1,426 ac. by the purchase of a tract extending all the way to Lake Pontchartrain. West End park has largely been built up by hydraulic dredging. There are numerous smaller parks well distributed throughout the city.

New Orleans is developing a tract of about 1,400 ac. on the south-east shore of Lake Pontchartrain, where the land is being built up by hydraulic dredging from the bed of the lake. The tract will contain 25 m. of boulevards and driveways, with parks and bathing beaches having a combined length of two miles.

Gas and Electricity.—Electric cars were first used in New Orleans in 1893. At that time there were several independent competing lines which were later consolidated into a modern, efficient system. The New Orleans public service supplies electricity for power and lighting, and supplies natural gas to power plants and for domestic use.

Port.—New Orleans is one of the largest North American ports, accommodating between 90 and 100 steamship lines; 908 vessels with a total net tonnage of 11,204,573 tons entered the port in the year ending Aug. 31, 1927. The limits of the Port of New Orleans include the parish of Orleans and a part of the parishes of Jefferson and St. Bernard bordering on the Mississippi, with a frontage of 41.4 m. on both sides of the river. About 7 m. of river front is equipped with publicly owned wharves, steel sheds, cotton warehouses, grain elevators, coal tipples and other modern facilities. The Inner Harbour navigation canal extends for 5 m. from the river to Lake Pontchartrain. Recent development of South West pass with an available depth of 35 ft., has made the port available to the largest ships.

Transportation.—Twelve railroad lines enter New Orleans: the Gulf Coast Lines, Illinois Central, Yazoo and Mississippi Valley, Louisiana Railway and Navigation Company, Louisiana Southern, Louisville and Nashville, Missouri Pacific, New Orleans Great Northern, New Orleans and Lower Coast, Southern Pacific, Southern Railway and the Texas Pacific. New Orleans owns and operates a Public Belt railroad, extending the length of the docks. The Federal Barge line supplies freight service to points on the Mississippi and Warrior rivers.

Commerce, Industry and Municipal Statistics.—The Merchants' Progressive Association of 1898 and the Progressive Union, which succeeded it the following year, were the organizations leading to the Association of Commerce in 1913. There are 14 bureaux and departments, and the membership is over 5,000. In 1928 there were over 660 factories, whose output was evaluated at \$153,741,868. The New Orleans Clearing House was organized in 1872; and there were in 1928 about a dozen large banks. The growth of the city may be shown by the following

comparative figures:—

	1910	1927
<i>Financial</i>		
Bank debits	\$2,991,128,000	\$4,765,757,000
Bank resources	\$131,771,263	\$330,171,886
Property valuation	\$230,846,187	\$607,086,071
<i>Buildings and utilities</i>		
Building permits	\$3,422,251	\$16,011,635
Water consumed—gallons	5,578,000,000	11,151,717,700
Water mains, miles	325	585
<i>Commerce and transportation</i>		
Water cargoes—short tons	3,964,109	16,538,167
Public belt railway, cars handled	113,727	334,265
Street railway mileage	162	209
Hard surface streets—mileage	114	263
<i>Public schools</i>		
Enrolment number	42,733	68,356
Value of property	\$2,688,000	\$15,481,282
<i>Public libraries</i>		
Number of volumes	100,102	235,982
Circulation	350,746	916,825
<i>Health</i>		
Deaths per 1,000 white-resident	14.23	11.97

Education.—The New Orleans public-school system consisted in 1928 of 63 kindergartens and elementary schools, five high-schools, one vocational school for girls and one normal school, for white pupils, and of 19 elementary and one high and normal school for coloured pupils. There were 12 elementary evening schools and one evening high-school for coloured pupils. The enrolment for 1926-27 was, for white schools, 48,731, and for coloured schools, 19,625, a total of 68,356; and the expenditure exclusive of building was \$3,568,743. There were over 60 private schools in New Orleans in 1927, and the Catholic Church has a system of parochial schools, each parish church conducting a school under the direction of the parish priest and, in most cases, taught by nuns. Uniform text-books are used and the classes are graded according to public school standards. There are several preparatory schools among which are Rugby academy, New Orleans academy, Holy Cross college and the Christian Brothers college. The Delgado Trades school was opened, near City park in 1921. The Isidore Newman Manual Training school was founded in 1903 and has a capacity of about 600 boys and girls.

Tulane University.—The history of Tulane university dates back to the foundation of the medical college in 1834. It was chartered in 1835 and in the following year issued the first degree in medicine conferred in the South-west. The Constitution of 1845 provided for the establishment of a university in New Orleans, embracing the medical college to which law and academic departments were to be added.

In 1882 Paul Tulane, for many years a merchant in New Orleans, gave liberally for the higher education of "the white young persons in the city of New Orleans." His entire donations reached the sum of \$1,050,000. He died at Princeton, N.J., in 1887. In 1884 the board of administrators of the Tulane educational fund received from the legislature complete and perpetual control of the university of Louisiana. This act was ratified in 1888 and again in the Constitutions of 1898, 1913 and 1921.

Tulane university had a total enrolment of 2,988 in all departments during the session of 1926-27, exclusive of the summer school, which numbered 1,751 more. Its endowment was then approximately \$8,000,000.

Loyola University.—In 1904, the Jesuit Fathers opened a school opposite Audubon park. A collegiate course was added and in 1912 the legislature granted them power to confer "degrees in arts and sciences and all the learned professions, such as are granted by other universities in the United States."

Monuments, Public Institutions and Customs.—The Delgado Art museum in City park was established by a gift from Isaac M. Delgado in 1911. There is a nucleus of an art collection containing many works of great merit. The annual exhibition of the Art Association is an important event. The Cabildo houses an important historical museum containing much of interest and

value pertaining to the history of Louisiana and New Orleans. The Presbytery, facing Jackson square on the side of the Cathedral of St. Louis, contains a valuable museum of natural history, principally relating to Louisiana. The Confederate Memorial hall contains relics of the Civil War. It is located on Camp street adjoining the Howard library. The Tulane university museum occupies the entire third floor of Gibson hall; it contains petrological, paleontological, zoological and anthropological sections. The Art museum in the Tilton Memorial library of Tulane university embraces the Linton-Surget collection of works of art. At Tulane university is the Gates collection of manuscripts, documents and other material relative to Mexico and Central America. This is constantly being added to by the expeditions and researches of the department of Middle American research, which has a permanent endowment of \$300,000.

New Orleans has a number of excellent hospitals: the Baptist; Charity; City (for mental diseases); Eye, Ear, Nose and Throat; Hôtel Dieu; Presbyterian; Soniat Mercy; and the U.S. Marine and U.S. Veterans' hospitals, the St. Rita Surgical and Touro infirmaries. Practically all of the charitable institutions of New Orleans receive contributions from a community chest. In 1928 these amounted to more than \$900,000.

Over 50 newspapers and periodicals are published in New Orleans, including two morning and two afternoon papers. The *New Orleans Picayune* was founded in 1837, the *Daily Times* in 1863, the *Daily Democrat* in 1875. The two latter formed the *Times-Democrat* in 1881 and this and the *Picayune* became the *Times-Picayune* in 1914. The *Daily Item* began publication in 1877; the *Daily States* started in 1880. The *Morning Tribune* was first published in 1924.

There are some 300 churches in New Orleans, representing different denominations. Roman Catholic churches are the most numerous.

The French opera house, designed by Gallier, was erected in 1859 at the corner of Bourbon and Toulouse streets. It was a distinctive and widely known centre of artistic and social life in New Orleans for many years. The Mardi Gras balls were held there until the building was destroyed by fire in 1919.

The carnival season extends from Twelfth Night to Lent, and its climax is reached in the festivities of Mardi Gras, the eve of Ash Wednesday. The ancient custom of celebrating the carnival was brought to New Orleans by the Latin peoples, and especially by the young creoles who studied in Paris and returned to live in New Orleans. Beginning with Twelfth Night there is a series of brilliant balls, and during the last week the balls of Momus, Proteus and Comus, preceded by gorgeous pageants, bring the season of mirth to a conclusion. On Mardi Gras Rex parades the streets and at night the final parade is that of Comus.

Among writers and historians of note associated closely with New Orleans should be mentioned: John James Audubon, C. E. A. Gayarré, Alcée Fortier, Grace King, Mary Ashley Townsend, Lafcadio Hearn, George W. Cable and Mollie Moore Davis.

Government.—The city government was at first carried out by a mayor and administrators, seven in number. Finally, in 1912, by act of the legislature, the commission form of government was adopted; the mayor became commissioner of public affairs. Four other commissioners have charge of public finances, public safety, public utilities and public property. At the first regular meeting after the election, the commission council by a majority vote assigns one of the councilmen to each of the above named departments.

History.—The city of La Nouvelle Orleans was founded by a French governor of Louisiana, Jean Baptiste Le Moyne, Sieur de Bienville, and was named in honour of the Regent, the Duc d'Orléans. The island of Orleans was chosen for the site, on an elevation along the east bank of the river and about 107 m. from its mouth, between the head of Bayou St. John and the river. Among the advantages of this site were the higher land, accessibility by two main waterways (the Mississippi and the lakes), and by Bayou St. John for the small craft of that day. On the other side of the river it was not far to Bayou Barataria, which later was destined to become the rendezvous of the famous

pirates, Jean and Pierre Lafitte, and which offered access to the gulf without stemming the current of the Mississippi.

There is some doubt as to the exact date of the founding of New Orleans, but it is generally given as 1718. It was then proposed that John Law's famous company, which had obtained charter for the territory from France, should move its headquarters from the barren coast country to the new site. New Orleans thus became the capital of the Colony in 1722. At this time the city had but 100 houses and 500 inhabitants. It was laid out in approximately a parallelogram, 4,000 ft. long on the river by 1,800 ft. in depth, divided into regular squares 300 ft. on each side. In 1724 the streets were named. The houses were rude cabins of split cypress boards, roofed with cypress bark. They were separated from one another by willow copses and weed-grown ponds swarming with reptiles. Two squares on the river front near the centre of the city were set apart for military and ecclesiastical uses. The front was the Place d'Armes, now Jackson square; the rear one was early occupied by a church. In 1726 a monastery was erected to the east of the church for the Capuchin monks, who had arrived two years earlier. A company of Ursuline nuns came to New Orleans in 1727. At the same time the Jesuits arrived and received a large tract of land from Bienville, the French governor. This tract, bounded by what is now Common, Tchoupitoulas, Annunciation and Terpsichore streets, was later added to by donation and purchase and extended to Felicity street. Here the Jesuits cultivated myrtle, the wax of which was then a staple article of commerce; the orange, the fig, indigo and probably sugar-cane. These became staple crops. The Order was suppressed for political reasons in 1763 and its great plantation confiscated by the king of Spain.

Many storms and disasters occurred during the early years of the city. In 1719 the river rose to a great height and the site was completely inundated to a depth of a few inches. In 1722 a hurricane destroyed 30 houses and damaged crops. German colonists who had settled on the banks of the Arkansas managed to reach New Orleans and there prayed Bienville to send them back to their homes. He persuaded them to establish themselves along the river above the city, and thus was formed the nucleus of the German settlement, which to this day is called the German coast.

There were few women of good character in the Colony in the early days; and many of the better class of settlers, missing their home life, desired to return to France. It thus became imperative that if the settlement was to survive, the men must have good wives to make homes for them. When Bienville left the Colony in 1724, he promised to send a load of good women as soon as possible. In 1727 the "Casket Girls" (*Filles à la cassette*) arrived and were placed under the care of the Ursuline nuns whose convent had been established in the same year. They were first domiciled in Bienville's former home, but in 1730 their own house on Chartres and Ursuline streets was completed. This is the oldest building in the United States west of the Alleghenies.

In 1763 the Treaty of Paris was concluded between France and England. By this treaty England gained all the territory east of the Mississippi except the Isle of Orleans. On Nov. 3, 1762, Louis XV. had, by the secret treaty of St. Ildefonso, given the Isle of Orleans and all of Louisiana west of the Mississippi to his cousin, Charles III. of Spain. It was not until Oct. 1764 that the French king notified governor Abbadie of the transfer of the Colony, nearly two years previously, to Spain, and ordered him to surrender Louisiana to accredited Spanish commissioners when they should present themselves. There was sorrow and dismay when these tidings were received. In 1783, the Treaty of Paris confirmed Spain in possession of this territory and granted free and open navigation of the Mississippi river to the subjects of Great Britain and the United States. In 1788, and again in 1794, fires destroyed large portions of the city. By the first, 19 squares were devastated, and 856 houses were burned. The second fire destroyed 212 houses and caused a loss estimated at \$2,600,000. Rebuilding with brick instead of wood, resulted in a more permanent city.

During this period the Spanish Governor, Almonaster y

Rojas, was the greatest benefactor of New Orleans; he gave freely of his private fortune for many purposes. He rented in perpetuity the squares flanking the Place d'Armes and erected a row of brick buildings to be used as shops and retail stores. These were replaced in 1845 by the Pontalba buildings, which bear the name of their builder, Baroness Pontalba, a daughter of the governor. He rebuilt the Charity hospital, which had been destroyed by a hurricane, and a chapel for the Ursuline nuns. Through his generosity the cathedral was completed in 1794; it was constructed of bricks and had much the same appearance as to-day except in details of the belfry and towers. A town-hall, or hall of the Cabildo, presented to the city in 1795, was used as a meeting place of the Spanish Cabildo. It was here that the formal transfer of Louisiana from France to the United States took place.

Before the cultivation of sugar-cane the staple crop of Louisiana had been indigo; but it did not prove successful. In 1794 Etienne de Boré succeeded in making granulated sugar. His plantation is now within the city limits. By the Treaty of Madrid, signed in Oct. 1795, Spain and the United States agreed that New Orleans should be open to the Americans as a port of deposit for three years; the produce was to be free of duty but a reasonable price for storage was to be paid. The commerce of New Orleans increased greatly, the levee was the scene of noisy, bustling business.

The purchase of Louisiana by the United States in 1803 had a further beneficial effect on trade. The first half of that year showed an increase of 37% in tonnage over that of 1802; exports exceeded \$2,000,000 and imports \$2,500,000. The flat-boat trade with the upper valley also increased enormously. Above the *vieux carré* commercial houses were erected and this newer portion of the city gradually became a business centre. Above the Terre Commune, Common street, was Madame Gravier's plantation, a part of the former Jesuit grant. Many of the street names are reminders of the first owners or of the first use of the locality. Gravier street bears the name of its original owner; Poydras that of a philanthropist; Magazine was so named because of the great tobacco warehouses on Magazine and Common, and Camp street because of a slave camp between Poydras and Girod. An aristocratic suburb was along the Bayou St. John road. Below the old city the Marigny plantation was settled by the French.

In 1805, New Orleans was incorporated as a city and the people exercised their right of suffrage for the first time in electing aldermen. Between 1803 and 1810 the population more than doubled with the arrival of many whites, mulattoes and slaves from Cuba, Santo Domingo and other islands of the West Indies. The creoles of those islands had much in common with the creoles of Louisiana—many were of French ancestry, they had the same religion, language and political ideas, and had met with the same political misfortunes. The creoles were numerically so strong that they dominated the city.

On Jan. 10, 1812, the "New Orleans," a steam propelled vessel built by Nicholas Roosevelt, arrived on her maiden trip from Pittsburgh.

The War of 1812 found New Orleans without adequate defences; Wilkinson was ordered to occupy that part of Florida west of the Perdido river; the Creek Indians massacred 350 whites at Ft. Mimms, Miss.; drunken Choctaws roamed the streets of New Orleans; Barataria bay was held by the Lafittes and their band of piratical smugglers, who appeared daily in the city. Claiborne had great difficulty in raising the quota of 1,000 men called for by the President, but finally accomplished it. Congress ordered Jackson to proceed to New Orleans for its defence.

Commerce on the Mississippi was greatly stimulated by the advent of steam navigation. In 1817, 1,500 flat-boats and 500 barges brought the produce of the valley to New Orleans. Four years later 287 steamboats, 441 flat-boats and 174 barges moored along the water front of the city. The American section became the market for cotton, tobacco, pork, beef, corn and flour, while the old city retained control of coffee, indigo, sugar, rice, foreign fruits and wine. In the year 1825, the imports and exports of the city were valued at \$17,000,000, and by 1835 at more than \$53,-

000,000, a part of the increase being due to the extraordinary rise of prices throughout the country. The population was cosmopolitan. In 1815 it numbered 33,000 and in 1820 had advanced to 41,000. Commerce increased more rapidly than population because of the absence of manufacturing; between 1830 and 1840 trade advanced 75% and the population only 20%.

In 1847-48 the exports of domestic products from New Orleans exceeded those of New York, although the total exports were less than those of the northern city; but imports at New Orleans were far less.

In 1842 receipts from the interior were valued at \$45,700,000 and in 1851 they had increased to \$107,000,000. One tenth of the arrivals were now steamships. This trade was carried on in spite of the danger from bars on entering the river; in the space of a few weeks, in 1852, 40 ships went aground at the entrance to the river. The terrible yellow fever epidemics of 1853-55 reduced the volume of trade, which was regained, however, and a high-water mark reached in 1857, to be followed by a financial crash which was disastrous to the business houses of New Orleans.

Louisiana seceded from the Union on Jan. 26, 1861. New Orleans was recognized as a strategic point by the authorities at Washington and two expeditions started to secure the Mississippi for the Union: Grant was to descend the river and Farragut and Butler were to ascend it. The city had sent 5,000 soldiers to the defence of the northern line of the Confederacy but the Southern Government seemed oblivious to the importance of holding New Orleans. While Grant was endeavouring to push his way down stream, Farragut was entering the river from the gulf with a fleet of 43 vessels. The assistance asked by Gen. Lovell could not be given by the Confederacy. An attempt was made to obstruct the passage of the Federal fleet by cables put across the river below the city, but New Orleans was captured by Farragut on April 25, 1862 and the city front blazed with the fire from thousands of bales of cotton and hogsheads of sugar and molasses which were burned to prevent their falling into the hands of the Federals.

Gen. Benjamin T. Butler with 15,000 soldiers took charge of the city on May 1, 1862. Mayor Monroe was removed from office and a military commandant appointed in his place. The city council was replaced by the bureau of finance and the bureau of streets and landings. Butler's rule in New Orleans was execrated by the people of the city and he was removed before the year expired.

The Republican Congress decided that the Southern States should be regarded as conquered territory, reconstructed and admitted to the Union. First of all the new freemen were to be secured in the enjoyment of their citizenship and suffrage. The white men of the State were virtually deprived of the ballot by all the restrictions placed upon its exercise. In the wake of the war came a host of undesirables seeking fortunes by easy means. They became known as "carpet baggers," and their Southern friends and associates were known as "scalawags." In New Orleans they gained control of the city government through leadership of the voting population—largely composed of the newly enfranchised negroes. The property of the city disappeared; extravagant expenditures reached \$6,961,381 by 1872 and the bonded indebtedness \$21,000,000, paying up to 10% interest.

The citizens of New Orleans formed the "White League" for the expulsion of the "carpet-bag" government and for restoring white supremacy. To frustrate their plan an order was issued forbidding a citizen to keep a firearm even in his home. It was rumoured that a ship was to arrive on Sept. 14, 1874, with a cargo of ammunition and the metropolitan police formed at the foot of Canal street with mounted cannon to prevent the citizens from reaching the vessel. The White League formed at Poydras street and moved out to the levee; a skirmish followed in which the metropolitan police were worsted, suffering considerable loss. By gradual successes the White League restored white control.

Improvements made but slow progress during restoration times and for many years after; the city undertook the operation of the water works in 1869; a drainage system was proposed in 1871 but proved too expensive to be carried out; in 1871 the board of park commissioners bought the Upper City park, now Audubon park. The population in 1860 was 168,755 and had

VIEWS OF THE OLD AND NEW CITY OF NEW ORLEANS

1. Air view of New Orleans, showing at the left Canal Street, the centre of the retail business district, and the skyscrapers of the modern city. In the middle distance is the Mississippi River
2. The historic Jackson Square, formerly called the "Place d'Armes," in the old French quarter. On one side is St. Louis Cathedral flanked by the Calabozo (calaboose) and the Cabildo, once the government buildings of the French. In the latter Lafayette was lodged in 1825 as the city's guest. On adjoining sides of the square are the so-called "Pontalba Mansions" built by the Baroness de Pontalba on her estate in 1849, now used as tenements

increased by 1870 to 191,418. During this decade many freed negroes had come to the city from the country districts. In 1870 the fifth and sixth districts were added by the annexation of the town of Algiers on the opposite bank of the river and of Jefferson City (formerly Lafayette), a town adjoining the fourth district. In 1874 Carrollton was admitted as the seventh municipal district, and New Orleans attained its present limits.

In the spring of 1927, New Orleans was saved from the great Mississippi river flood, which temporarily made much of Louisiana and other States an inland sea, by blasting the levee at Poydras, about 15 m. below the city, on April 29. This operation sacrificed the adjacent parishes of St. Bernard and Plaquemines at a cost to the city of approximately \$5,000,000.

About 35 m. above New Orleans a spillway is being constructed to remove 250,000 second-feet of water from the river during excessive floods and deliver it into Lake Pontchartrain. This will reduce the gauge heights at the city and will eliminate the fear of the Mississippi river during future floods. (W. B. G.)

The Battle of New Orleans.—This was the final engagement of the American War of 1812 (q.v.), fought on Jan. 8, 1815, between the forces of the United States, under Maj.-gen. Andrew Jackson, and those of Great Britain under Maj.-gen. Sir Edward Pakenham. The abdication of Napoleon in April 1814 made it possible for Great Britain to give more attention to her American antagonists. The Gulf of Mexico region was selected for the attack, and late in 1814 a fleet of 50 vessels and an army of nearly 10,000 veterans were dispatched to the region of the Mississippi river. The British advance was made by way of Lake Borgne and the Villere canal to the bank of the Mississippi where the advance-guard appeared on Dec. 23, 1814. Jackson was wholly surprised by this movement but with a superior force made an immediate (Dec. 24) attack with such effect that the British decided to wait for the main army and their artillery. This gave Jackson time to fortify a dry canal and to receive additional reinforcements.

At last, in the early morning of Jan. 8, 1815, a direct attack was made on the now strongly entrenched line of the defenders at Chalmette, near the Mississippi river. It failed disastrously with a loss of about 2,000 out of 9,000 British troops engaged, among the dead being Pakenham and Maj.-gen. Gibbs. The British attack on the right bank had been successful but Gen. Lambert, Pakenham's successor, was unwilling to take the responsibility of any further fighting. The expedition was soon abandoned, and by the end of the month the troops embarked for England. The American loss proved to be 71, out of a total of about 4,000 engaged on both sides of the river. The battle of New Orleans had no bearing on the outcome of the war as peace had been made at Ghent 15 days before the battle was fought, but news of the battle and the peace reached Washington almost together. (See WAR OF 1812.)

NEW PHILADELPHIA, a city of eastern Ohio, U.S.A., 75 m. S. by E. of Cleveland, adjoining Dover, on the Tuscarawas river and Federal highway 21, at an altitude of 890 ft.; the county seat of Tuscarawas county. It is served by the Baltimore and Ohio, the Pennsylvania and electric railways. Pop. 10,718 in 1920 (92% native white); estimated locally at over 12,000 in 1928. Coal and fire-clay abound in the immediate vicinity, and the city has important manufactures (including enamelled ware, tinplate, electric and vacuum sweepers, iron castings, steel, trucks, trailers and brick) with an output in 1925 valued at \$6,380,691. There are 16 large plants in the county making sewer pipe, and 25 making brick. On May 3, 1772, a company of Christian Indians led by the Moravian missionary, David Zeisberger (1721–1808), came from western Pennsylvania, and three months later John Hecke-

welder (1743–1823) arrived with 200 more Indians. They laid out the town of Schoenbrunn at the "big spring" a little south-east of the present city of New Philadelphia, built the first church and the first school-house in Ohio, and more than 60 dwellings of hewn timber, but were obliged to abandon the settlement in 1777 on account of the hostility of the neighbouring Indians. The site of Schoenbrunn, discovered in 1923, has been bought by the Ohio State Archaeological and Historical Society, which proposes to reconstruct the pioneer town. Other missions were planted in this region at Gnadenhütten (1772), Lichtenau (1776) and Salem (1780). On March 7 and 8, 1782, the 96 peaceful Christian Indians at Gnadenhütten were tricked and brutally massacred by a force of 100 whites sent out from Ft. Pitt under Col. Williamson. At Zoar, 5 m. N. of New Philadelphia, a settlement was made in 1817 by 225 Germans under the leadership of Joseph Bimeler. In 1824 they organized a communistic society, which lasted until 1898. New Philadelphia was founded in 1804 by John Knisely, from Pennsylvania. It was incorporated as a village in 1815 and chartered as a city in 1896.

NEW PLYMOUTH, a municipality and seaport on the west coast of North Island, New Zealand, capital of the provincial district of Taranaki, 258 m. north-north-west of Wellington by rail. Pop. (1927) 16,790. The district is not unjustly termed "the garden of New Zealand." It is highly fertile, cereals and fruits growing well; and it is one of the chief dairy centres of New Zealand. The settlement was founded in 1841 by the Plymouth Company under the auspices of the New Zealand Company, and chiefly consisted of emigrants from Devonshire and Cornwall. On the seashore in the neighbourhood are extensive deposits of iron sand.

NEWPORT, a municipal, county and parliamentary borough, seaport and market town of Monmouthshire, England, on the Usk, 5 m. from its confluence with the Severn, and 13½ m. from London by the G.W. railway. Pop. (1921) 92,358. It lies chiefly on the right (west) bank of the river, and on the east, north and west it is sheltered by a line of hills.

An ancient mesne borough and castle, it occupied an important position on the Welsh marches. The town, which is not mentioned in Domesday, grew up round the castle built early in the 12th century. Giraldus Cambrensis, writing in 1187, calls it *Novus Burgus*, probably to distinguish it from Caerleon, whose prosperity declined as that of Newport increased. From Robert Fitz Hamon (d. 1107) the lordship passed to the earls of Gloucester and Stafford and the dukes of Buckingham. Hugh le Despenser, who held the lordship for a short time, obtained in 1323 a charter of liberties for the burgesses, granting them freedom from toll throughout England, Ireland and Aquitaine. The earl of Stafford granted a further charter in 1385, confirmed by his grandson in 1427, which gave the burgesses the right of self-government and of a merchant gild. On the attainder of the duke of Buckingham in 1483 the lordship lapsed to the Crown, of whom it was held in the 16th and 17th centuries by the Pembroke, and in the 19th by the Beauforts. The town was incorporated by charter of James I. in 1624 under the title of "Mayor and Bailiffs." This charter was confirmed by Charles II. in 1685. In 1385 the borough obtained a market lasting 15 days from the vigil of St. Lawrence (Aug. 10). The charter of 1624 granted two fairs, one on the feast of the Ascension, and a second on St. Leonard's day (Nov. 6). Newport was the scene of a serious Chartist riot in 1839.

The old parish church of St. Woollos (since 1921 the cathedral church of the Anglican diocese of Monmouth) stands on Stow hill. Originally it consisted only of the present nave, a fine specimen of grand, though unadorned, Norman architecture; but a massive square tower (of the time of Henry III.) and a chancel were subsequently added; a large western Early English lady-chapel is interposed between the nave and the tower. The castle, founded at the close of the 11th century, was greatly altered in the late Perpendicular period. The old Dominican monastery is entirely rebuilt and occupied as a private residence; but there are a few fragments of a house of White Friars. There is a museum and art gallery. Newport owes a rapid increase in importance during the second half of the 19th century to its situa-

tion on a deep and spacious tidal river, which renders it an outlet for the eastern section of the South Wales coalfields.

Its population in 1801 was only 1,135. The Old dock was partially formed in 1842, while the Alexandra was opened in 1875. There were many subsequent extensions of the docks (particularly in 1907 and 1913), which are now owned by the G.W.R. company. The administration of the docks is in the hands of the Harbour commissioners. There are the Alexandra, North and South, docks with a quayside of 7,839 and 17,189 ft. respectively, and the Town (Old) dock with a quayside of 4,853 feet. The average depth of water in both Alexandra docks, which form a single sheet of water, is 45 ft. at spring tides and 35 ft. at neap tides. In the Old dock the depths are 30 ft. and 20 ft. respectively. There are two dry docks connected with the Alexandra docks, one owned by the G.W.R. company being 523 ft. long and 74 ft. wide, while the privately owned dry dock is 415 ft. long and 60 ft. wide. There are six other private dry docks all of them entered from the river. The town has grown rapidly during the first quarter of the 20th century under a town planning scheme, and extensive building has been carried out at Somerleyton and St. Julien's. It is now spreading over Caerleon. Newport returns one member to parliament.

NEWPORT, market town, municipal borough, the chief town of the Isle of Wight, England. Pop. (1921) 11,031. It is situated near the centre of the island, at the head of the navigation of the Medina river, 5 m. S. from its mouth at Cowes. It is the chief centre of the railway system of the island. The church of St. Thomas of Canterbury was rebuilt in 1854 in the Decorated style. The guildhall, erected in 1816, includes the town-hall in the upper story with the market-place below. There are a corn exchange and museum. The grammar school was founded in 1612, and there is a blue-coat school for girls founded in 1761. The Albany barracks and Parkhurst prison lie north of the town. A considerable trade is carried on in timber, malt, wheat and flour. It is supposed that Newport (*Neuport*) was a Roman settlement, then known as *Medina*. There are no traces of Saxon occupation, and no evidence that Newport became a borough before the reign of Henry II. The first charter was granted by Richard de Redvers between 1177 and 1184, and confirmed in 1349 by Edward III. and afterwards by successive kings. The borough was incorporated by James I. in 1607, and a second charter of incorporation granted by Charles I. in 1637 is that by which Newport was governed until 1835. It was represented in parliament in 1295, but no other return was made until 1584, when it regularly sent two members. From 1867 to 1885 it sent one but in 1885 its representation was merged in that of the island. A fair was formerly held on Whit-Monday, the two following days and the three Saturdays nearest Whitsuntide. The Saturday market dates from 1184, and there is a Wednesday cattle market. Owing to its facilities for trade, Newport early superseded Carisbrooke as the capital of the island.

NEWPORT, a market town and urban district of Shropshire, England, 18 m. E.N.E. of Shrewsbury, with stations on the G.W.R. and L.M.S.R., and on the Shrewsbury canal. Pop. (1921) 3,054. Newport is not mentioned in Domesday, but at the time of the Conquest formed part of the manor of Edgmond, which William I. gave with the rest of Shropshire to Roger, earl of Shrewsbury. Henry I. is thought to have founded the borough, at first called New Borough, after the manor had come into his hands through the forfeiture of Robert de Belesme. The site was probably chosen partly on account of the fisheries which are mentioned in Domesday. Henry II. granted all the liberties, rights and customs which the town enjoyed under Henry I. Henry III. granted the borough with the manor of Edgmond, to Henry de Audley. Confirmation charters were granted by Edward I. in 1287 and Edward II. in 1311. The town was incorporated in 1551 by Edward VI. whose charter was confirmed by James I. in 1604. The governing body consisted of a high steward, deputy steward, two water-bailiffs and 28 burgesses, but the corporation was abolished by the Municipal Corporation Act of 1883, and a Local Board was formed, which, under the Local Government Act, gave place in 1894 to an urban district council. The church of St. Nicholas is Early English and Perpendicular. There is an ancient market

cross. Newport possesses a grammar school founded in 1665. To the south of the town are the ruins of Lilleshall abbey.

NEWPORT, a city of Campbell county, Kentucky, U.S.A., on the Ohio river, opposite Cincinnati and adjoining Bellevue, and separated from Covington only by the Licking river. It is on Federal highways 25 and 27, and is served by the Chesapeake and Ohio and the Louisville and Nashville railways, inter-urban trolley and motor-bus lines, and river steamers. Pop. 29,317 in 1920 (90% native white). It is a residential suburb of Cincinnati, and also an important industrial centre, with rolling mills, steel works and other manufacturing plants. The factory output in 1925 was valued at \$17,171,617. In the highlands 2 m. back of the city is Ft. Thomas (a U.S. military post, established in 1888 to supersede Newport barracks [1804]) and a town of the same name (pop. 5,028 in 1920). Newport was laid out in 1791, incorporated as a town in 1795 and chartered as a city in 1834.

NEWPORT, a city of Rhode Island, U.S.A., 30 m. S. by E. of Providence, occupying the southern end of the island of Rhode Island (or Aquidneck); a port of entry, the county seat of Newport county, a place of great historic interest, and a fashionable summer and autumn resort. It is served by the New York, New Haven and Hartford railroad, motor-bus lines, various ferries and the Fall River line of steamers. Pop. (1920) 30,255 (19% foreign-born white and 5% negroes).

From the harbour on the west the city rises to a gently rolling plateau with maximum elevations of about 250 feet. The climate is mild and equable throughout the greater part of the year. The "Old Town," with its narrow streets and 18th century houses, climbs the hill back of the harbour. At the head of Washington square, or the Parade, stands the old State House (or Colony House, when it was built in 1739), now used by the county court, containing a full-length portrait of Washington by Gilbert Stuart, where Washington, Adams, Jackson and other presidents have been entertained. Near by are the birthplace of Commodore Perry, and the Vernon house (built in 1758, and occupied by Rochambeau during the Revolution), which still has its beautiful mahogany balustrades, panelled chimney-pieces and Delft-tiled hearths. Trinity church (1725) has a lovely white spire, tipped with a golden crown. At the head of Touro street (named for Isaac Touro, an early rabbi of Dutch nativity) is the Hebrew cemetery (established in 1677) and farther down the street is a fine synagogue (1763) said to be the oldest in America. The old Friends' meeting house, part of which dates from 1699 (the first one built on American soil) is now a museum, and its extensive grounds are used as playfields. In Touro park, near the upper end of Bellevue avenue, is the old stone mill, frequently attributed (as by Longfellow in his *Skeleton in Armor*) to the Norsemen; and near by is the Redwood library, incorporated in 1747 (a development of the Philosophical Society founded in 1730), occupying a building erected in 1750, and named for Abraham Redwood (d. 1788), a Friend who contributed £500 for books. A little farther on is the Casino, and from this point Bellevue avenue, extending south to the ocean, is bordered on both sides with the summer "cottages" of wealthy New Yorkers—palatial structures representing almost every possible style of architecture, set in ancient trees and modern gardens, behind high stone or brick walls or grilled fences. A horse show has been held every year since 1896, and a dog show is also an annual event. On Conanicut island, west of Newport, is the old town of Jamestown (pop. [1925] 1,773) also a summer resort.

Newport's inner harbour, formed by a deep indentation in the western shore, has a depth of about 18 ft. and is almost land-locked. It is guarded by Ft. Adams on the point forming its western boundary. On Goat island, lying in the entrance of the harbour, is Ft. Walcott, with a U.S. torpedo station; and on Coasters Harbor island, farther north, off which the old frigate "Constellation" rides at anchor, are a training station of the U.S. navy, a Naval War college, a Naval hospital and old Ft. Greene. The traffic of the harbour (entirely domestic commerce) amounted to 146,532 tons in 1925, valued at \$14,220,157.

Newport was founded in 1639 by John Clarke, William Coddington and other Antinomians, who had been driven out of the Massachusetts Bay Colony. The Baptist church they organized

in 1640 is the oldest in the United States, after the one in Providence. An independent government by judge and elders was established, but in 1647 the town united with Providence, Portsmouth and Warwick to form the Colony of Rhode Island and Providence plantations, under the charter secured by Roger Williams in 1644. In 1656 there was an influx of English Friends. The first newspaper was published in 1732 by James Franklin (a brother of Benjamin), whose son James in 1758 established the *Mercury*, still published. Between 1739 and 1760 great fortunes were made in the "triangular trade" with Africa and the Barbadoes, in which rum from Newport was exchanged for slaves in Africa, who were exchanged for sugar and molasses in the Barbadoes, which were brought back to Newport to be made into more rum. In 1770 Newport's foreign trade was greater than that of New York, but it was entirely destroyed by the Revolution, when the town was in the hands of the British from Dec. 1776 to Oct. 25, 1779. After the evacuation of the British it was occupied by French troops under Rochambeau, and in 1780-81 it was a station of the French fleet. Newport was chartered as a city in 1784; resumed the town form of government in 1787; was again chartered as a city in 1853; and secured a new charter in 1906. Until 1900 it was one of the capitals of Rhode Island. The influx of wealthy New Yorkers began after the Civil War.

NEWPORT, a city of northern Vermont, U.S.A., a port of entry and the county seat of Orleans county; beautifully situated at the southern end of Lake Memphremagog, 6 m. from the Canadian border. It is on Federal highway 5, and is served by the Canadian Pacific and the Quebec Central railways, and in summer by lake steamers. Pop. (1920) 4,976. It is a summer resort, a centre for winter sports, a shipping point for maple-sugar and farm products, and has several manufacturing industries. It was founded about 1810 and incorporated as a city in 1918.

NEWPORT NEWS, a city and a port of entry of south-eastern Virginia, U.S.A., on the north side of Hampton Roads and the James river, opposite Norfolk; in Warwick county, but independent of it. It is on Federal highway 60; is the tide-water terminus of the Chesapeake and Ohio railway; and is served also by interurban trolley, motor-bus and truck lines, several ferries and numerous steamship lines. Pop. 35,596 in 1920 (40% negroes); estimated at 53,300 in 1928. Newport News is one of the four cities forming the port of Hampton Roads (*q.v.*), the principal coal and tobacco port of the United States. Its harbour, spacious and well protected, is connected with the ocean by a channel 600 ft. wide and 35 ft. deep. Nearly a mile of the water front, at the southern end of the city, is occupied by the great railway terminal, covering 337 ac., and comprising 125 m. of track, storage space for 4,500 cars, warehouses with 1,500,000 sq. ft. of floor space, piers specially equipped for handling bunker and cargo coal and other commodities, and a grain elevator with a capacity of 1,000,000 bushels. Farther north on the river are the ship-yards (among the largest in the country) which have built many United States battleships, cruisers, gunboats and numerous merchant vessels (including the largest ever built in America, the S.S. "California," of 31,000 tons displacement, completed in 1928), and where in 1922-23 the "Leviathan" was reconditioned. Between these two outstanding features of the city, about the centre of the water front, is a public park, and near by a municipal harbour for small boats. Newport News exports over 7,000,000 tons of coal and 145,000,000 lb. of tobacco in a year. Its total water-borne commerce in 1926 amounted to 8,887,442 tons. The exports, chiefly tobacco, coal and automobiles, were valued in 1925 at \$53,352,024; the imports, largely copra, pulpwood, manganese ore and fertilizer materials, at \$3,933,519. Shipbuilding and repairing are the principal manufacturing industries. The aggregate factory output in 1925 was valued at \$19,719,194. The city operates under a commission-manager form of government. Its assessed valuation for 1928 was \$44,160,902.

A settlement of Irish colonists was planted here in 1621 by Daniel Gookin, and the name was chosen to honour Capt. Christopher Newport, an associate of John Smith, and Sir William Newce,

on whose advice the site was selected. It remained a small hamlet until in 1881 it became the eastern terminus of the Chesapeake and Ohio railway. The city was laid out in 1882 and incorporated in 1896. By 1900 it had a population of 19,635.

NEWPORT PAGNELL, a market town in Buckinghamshire, England, 56 m. N.W. by N. of London, on the L.M.S. railway, and at the junction of the river Ouzel with the Ouse. Pop. (1921) 4,142. The church of St. Paul and St. Peter has Early English portions. The almshouse called Queen Anne's Hospital is named from Anne of Denmark, queen of James I., who reconstituted a foundation of the time of Edward I.

NEWQUAY, a seaport and watering-place of Cornwall, England, 14 m. N. of Truro by rail. Pop. of urban district (1921) 6,637. It is situated on Newquay bay, sheltered to the west by Towan head. The harbour, artificially constructed, and equipped with a jetty and piers, admits vessels of 200 tons. China stone and china clay are exported and coal is the chief import.

NEW ROCHELLE, a city of Westchester county, New York; U.S.A., on Long Island sound, the Boston Post road and Hutchinson River parkway, 16 m. N.E. of the Grand Central station in New York city. It is served by the New York, New Haven and Hartford and electric railways. Pop. (1920) 36,213 (23% foreign-born white); 1928 local estimate 48,800. New Rochelle is primarily a residential suburb of New York, with some fine old colonial dwellings still standing, and many beautiful modern residential districts of park-like contour. It is the seat of the College of New Rochelle (Roman Catholic; 1904). The city has an area of 10.2 sq.m., 9 m. of water front, and a rolling surface reaching an altitude of 289 feet. Zoning ordinances are in effect, and there is a city-planning commission. Besides three city parks covering 83 ac., there are within the city limits parks, parkways and bathing beaches (including Glen island) aggregating 385 ac., owned by the county. There is comparatively little manufacturing, except for local consumption. The Knickerbocker Press is in the outskirts of the city. The assessed valuation for 1927 was \$134,200,524, and the value of exempt property is estimated at \$15,000,000. On the landward side the city is fringed by residential suburbs, including Larchmont, Pelham and Pelham Manor. The farm given by the State to Thomas Paine at the close of the Revolution is marked by a monument on the road to White Plains, and the farmhouse is now a museum. On David's island, 2 m. S.W. of New Rochelle, is Ft. Slocum, a U.S. army post. The New York Athletic club has a country clubhouse on Travers island, just east of Pelham Manor. The first settlement of importance on the site of New Rochelle was made in 1688 by Huguenots, some of whom came from La Rochelle. The village was incorporated in 1847 and in 1899 it became a city. In 1850 the population was 2,458. By 1900 it had grown to 14,720, and between 1900 and 1910 it practically doubled.

NEW ROSS, a town of co. Wexford, Ireland, on the Barrow, 2 m. below its junction with the Nore, 102 m. S.S.W. of Dublin by the Great Southern railway. Pop. (1926) 5,009. St. Alban built the abbey of Rossmactreoin, which gave rise to the ancient city Rossglas. There are remains in Rossercon of a 13th century Dominican foundation. According to Camden, New Ross was founded by Isabella, daughter of Strongbow and wife of William Marshal, afterwards earl of Pembroke. A charter granted to it by Roger Bigod in the reign of Edward I., was extended by James I. and James II. In 1269 the town was surrounded by walls. The fortresses were dismantled by Cromwell, but some remains are extant. The Barrow is crossed by a swivel bridge. The inland water communications reach to Dublin by means of the Barrow and the Grand canal. The Nore is navigable to Inistioge. New Ross has breweries and tan-yards, a salmon fishery, and exports agricultural produce. The urban district includes Rossercon.

NEWRY, a seaport and market town of co. Down, Ireland, on the Newry water and Newry canal at the extreme head of Carlingford lough, 73 m. N. of Dublin by the Great Northern railway. Pop. (1921) urban dist. 11,963. In 1175 an abbey was founded here by Maurice M'Loughlin, king of Ireland. It was converted in 1543 into a collegiate church for secular priests, and was dissolved by Edward VI., who granted it to Sir Nicholas

Bagenal, marshal of Ireland. In 1689 Newry was set on fire by the duke of Berwick when in retreat before Schomberg. Charters were granted to the town by James I. and James II. Until 1898 a portion of Newry was situated in co. Armagh. A mile N.E. of the town is a notable rath or enclosure, taking its name of Crown rath from traditional single encounters between native princes in contention for the sovereignty. The L.M.S. railway connects Newry with the deep-water harbour at Greenore; and there is an electric railway to Bessbrook in co. Armagh. The western part, called Ballybot, is connected with the eastern part, or old town, by bridges over the canal and over the tidal water. The port admits vessels of 3,000 tons to Victoria basin, 3 m. from the town.

NEWS AGENCY. An agency which supplies news to periodicals, clubs, associations, or private persons, by telegram, in manuscript, proof, by tape machine or duplicated; less frequently by telephone. A news agency does not itself publish news but supplies information privately to its subscribers.

British News Agencies.—These may conveniently be divided into four categories:

(1) *Propaganda News Agencies.* These are generally small in size and confine their information to the particular question in which they are interested. Examples are the Labour Press Service and the Protestant Press Bureau. Information from these bureaus, though sent out in good faith, is necessarily scrutinized more carefully for possible bias by the experienced journalist than information received from other sources. In general these bureaus are not commercially profitable enterprises but are subsidized by political or other organizations.

(2) *Local Agencies.* In a number of middle-sized towns there are news or reporting agencies such as the Bradford Press Bureau or the Aberystwyth News Agency, whose object is not merely to serve the local press with news of every kind but to take in some measure the place of a local correspondent for the lesser London dailies. Agencies of this class and the first frequently send in unsolicited information, to be paid for if and as used. Agencies of the two following classes rarely do so.

(3) *Technical Agencies.* These, such as the Aviation News Agency, the Commercial Press Telegram Bureau, the Hockey Reporting Agency, explain their function by their names. They are mostly situated in London, and they necessarily appeal to a limited clientele; but some, especially the sporting agencies, are very considerable enterprises.

(4) *National Agencies.* Infinitely the most important form of news agency is the national agency, both from the range of its activities, the size of its staff and its powerful and subtle influence in the press. Of these, though the name of the British United Press is occurring more and more frequently in the columns of London dailies, there are but four of prime importance: the Press Association Ltd., which deals only with home affairs, Reuters' Ltd., which deals only with foreign affairs, the Central News Ltd., and the Exchange Telegraph Company Ltd., both of which cover both fields.

Use of News Agency Material. An inexperienced reader may well be surprised when he finds that a high percentage of the general news in two supposedly hostile dailies is given in identically the same phrasing, word for word and comma for comma. A closer investigation will disclose, either prominent or hidden in the second or third sentence, an ascription to the Exchange, Reuters, or Central News: if there is none, the "copy" is probably Press Association matter. It is now true that the material from which is made up a high proportion of those papers which do not, like the *Times* or the *Observer*, maintain a very large staff of correspondents, is identical: the scope of the editor and subeditors is now largely confined to the selection and presentation of material which has been presented in identical form at the same minute to every other London office. The task of a newspaper staff is consequently nowadays no longer exclusively the procuring of news but very largely the *cuisine* of standard material which arrives automatically. The influence of the agencies has been severely attacked as limiting the freedom of the press. The sources of information are narrowed and it is stated that there is more possibility of bias or suppression. On the other hand, as will be shown,

the field of information is far more effectively "covered" than was possible last century.

All newspapers rely chiefly on the agencies for the receipt of what may be called formal or expected news such as university intelligence, market returns or city quotations. In the same category, to a large extent, fall many ministerial statements, which are often circulated through the Press Association or other agencies. Such circulation obviates the calling together of some scores of reporters to hear precisely the same words; moreover, an experienced politician, though he may add in an interview extra details for the papers he desires to favour, will not make his general statement until he is assured that the agency representatives are present, as through them he can speak to the whole British and much of the Colonial press.

For general news, the agencies cover a larger area than any one journal could. At any one of the smaller London police courts, for example, an interesting or scandalous case may at any moment come up without warning. No private reporting staff could hope to catch every such case, but an agency man is almost certain to be in attendance. If, again, it is known that a case or a function of unusual interest is expected in a town where the paper concerned has no correspondent, a "special" is ordered from an agency, which details one of its reporters, for that day only, to telegraph an exclusive report to its client.

Agency material, in London, is delivered by telegram, by duplicated sheets delivered by hand, and (in the case of the Central News, Reuters and the Exchange) by tape machines. The largest foreign service is supplied by Reuters, used by the British government during the World War for propaganda purposes and denounced as mendacious by the German Press, as in the famous cartoon *Das Reuter Denkmal*. The agencies have been charged with bias in their presentation of news, especially foreign news. The truth or otherwise of this charge must be a matter of opinion, but it can safely be said that there is no authenticated case of the agencies having refused their services to a journal to whose policy they objected. The power of the American Associated Press has no parallel in Britain, nor have the disputes over its exclusiveness and the competition for "A.P. franchises."

The services provided for the provincial press are in some ways even more extensive, as they include "London letters" and often the only reports received of Parliamentary proceedings. Even syndicated "leaders" are often sent out, and propaganda agencies supply newspapers (other than dailies) half-printed, with blank pages for local information. The staff of the agencies are for the most part organized in the National Union of Journalists, and salaries, in comparison with pre-war rates, have notably increased.

(R. W. P.)

United States.—Two rival principles underlie American news agencies. The Associated Press and the Canadian Press represent one principle, that of pure co-operation and mutuality, and the United Press Associations and the International News Service represent the opposite fundamental in that they are profit-making corporations, collecting and selling service on commercial lines. There is lively competition in the news agency field, both for group domination and for reportorial achievement. In one sense, all of the news services serve a common ideal which is to deliver to their "members" or "clients" the important news by the most rapid means, written true to authenticated or evidential facts without bias, opinion or undue colour.

The development of the American news agency dates back to the struggle of the pioneer press of New York. While individual editors of the colonial press and their successors for 50 years had with interesting enterprise employed the foot-courier, the packet, the stage-coach, the pony-express, the canal-boat and the primitive steam-train, the birth of the idea that there might be co-operation among several newspapers in the collection of news which all could share occurred just 100 years ago when the Association of Morning Newspapers was organized in New York for the purpose of maintaining boats to meet ships as they came up the bay bearing news from Europe. The first telegraph line, running from Washington to Baltimore, was not opened until 1843. Fifteen years later the Atlantic cable was opened for

traffic. Other co-operative news agencies, concerned with the business of meeting ships in New York harbour, were later organized and from a merger of these the New York Associated Press, a co-operative news-gathering organization of New York newspapers, was formed. It was mutual in New York, but sold its product to newspapers in other American cities. In various sections of the United States other small, co-operative or privately owned news agencies gradually came into being, such as the New England Associated Press, the Southern Associated Press and the Western Associated Press. The United Press, which is not to be confused with the United Press Associations of this day, was established as a national rival to the various Associated Press units, then only beginning to co-operate. Morse's invention of the telegraph was the basis of these agency operations. In 1892 the unified Associated Press took the field as the rival of the old United Press. It succeeded in making contracts for the exclusive use in the United States of the news reports of the leading European agencies—Reuter in Great Britain, Wolff in Germany and Havas in France. These connections had previously been in favour of the United Press and their loss resulted in the failure of the latter organization. To supplant the United Press several agencies were formed by groups of newspapers outside of the Associated Press group. They were the Publishers' Press and the Laffan Service operating in the eastern States, the Scripps-McRae Press Association, operating in the Middle West and the Scripps-Blade Service, operating in Pacific coast States. Except for the Laffan Service, which was finally discontinued, these services merged to form the United Press Associations of to-day. The organization was completed in 1907. The Associated Press was reorganized in 1900 and incorporated under the laws of New York, as a purely co-operative association that could declare no dividends, that elected its membership and shared the cost of operation among members who are individuals representing newspapers, not the newspapers themselves. The International News Service and the Universal News Service, the former to serve evening and Sunday newspapers and the latter to serve morning and Sunday newspapers, on a commercial basis, were established by William Randolph Hearst in 1906. Early in 1928 the Universal Service left the "spot-news" field to give its exclusive attention to special or "feature" news. The Canadian Associated Press is co-operative, non-profit making, its elected members dividing the costs of operation. It works in close relation to the Associated Press, with an exchange of news reports. (M. E. P.)

NEW SIBERIAN ISLANDS are situated off the Arctic coast of Siberia, from 73° to 76° 6' N., and 135° 30' to 151° E. The name is loosely applied, covering either the northern group only of these islands, for which the name of New Siberian or Anjou Islands ought properly to be reserved, or the southern group as well, which ought to retain its name of Lyakhov Islands. Some confusion prevails also as to whether the islands Bennett, Johkov, Vilkitski, Henrietta and Jeannette, ought to be included in the same archipelago, or described separately as the Jeannette or De Long Islands. The first three of these belong geographically, and probably geologically to the New Siberian group, from which they are less than 100 m. distant. Henrietta and Jeannette Islands lie 200 m. north-east of Novaya Sibir Island, in 157° to 159° E. Sannikov Land, reported by J. Sannikov in 1805 to lie north of Kotelni Island, probably does not exist. The islands form part of the Yakutsk Soviet Republic.

The *New Siberian Islands* consist of Kotelni, the largest (116 m. long, 100 m. wide), having the small island Byelkovski near its western shore; Thaddeus (Faddeevski), in the middle; and Novaya Sibir, New Siberia, in the east (90 m. long, 40 m. wide). Kotelni is the largest and reaches an altitude of 1,200 ft. in the volcanic Malakatyn-tas mountain. It is built of Silurian coral limestones (Llandovery division), containing a rich fossil fauna. The same Silurian deposits are widely spread on the mainland as far as the Olenek. Middle Devonian limestones and slates are all faulted north-north-west and south-south-east. Triassic slates appear in the south-east. Diabases pierce to Devonian rocks. The eastern portion of the island, named Bunge's Land, is covered with Post-Tertiary deposits. Novaya Sibir Island attains altitudes

of 200 to 300 ft. in its western portion. The so-called Wood Mountains, which were supposed to be accumulations of floating wood, are denudations of Miocene deposits containing layers of brown coal with full stems of trees. These Tertiary deposits are characterized by a rich flora and fauna, testifying to a climate once very much warmer. The only representative of tree vegetation now is a dwarf willow 1 in. high.

The *Lyakhov Islands* consist of Bolshoi, or Blizhni, which is separated by Laptev Strait, 27 m. wide, from Svyatoi Nos of Siberia; Mali, or Dalni; and several smaller islands to the west of Mali. Bolshoi too consists of granite protruding from beneath non-fossiliferous deposits. Along its southern coast Baron Toll found immense layers of fossil ice, 70 ft. thick, evidently relics from the Ice Age, covered by an upper layer of Post-Tertiary deposits containing numbers of perfectly well-preserved mammoth remains, rhinoceros, *Ovibos*, and bones of the horse, reindeer, American stag, antelope, *saiga*, and even the tiger, associated with relics of forest vegetation. A stem of *Alnus fruticosa*, 90 ft. high, was found with all its roots and even fruit. Similar deposits of ground ice occur in Vasilievski Island. Basalts and Tertiary brown coal deposits enter into the composition of the southern extremity of Bennett Island; Vilkitski Island is low (50 ft.) and basaltic. Bennett and Henrietta Islands have a few small glaciers. The New Siberian Islands have none.

The climate of these islands is very severe. In 1886 the winter ended only in June, to begin anew in August (May 21, -5.8° F; Oct. 16, -34.6°). The highest summer temperature was 50°. Flocks of geese and other birds come to the islands in summer. The lemmings are numerous. Reindeer, followed by wolves, come across the ice from Siberia; the fox and polar bear feed on the lemmings. There is much driftwood. The islands have been long known to Siberian hunters who come for furs and fossil ivory.

A Yakutsk Cossack, named Vaghin, wintered on Bolshoi in 1712, but it was a merchant, Lyakhov, who first described the two greater islands of this group in 1770, and three years later reached on sledges the largest island of the New Siberian group, which he named Kotelni. M. Hedenstrom, accompanied by Sannikov, explored the archipelago and published a map of it in 1811. Anjou visited it in 1821-23. A scientific expedition under Dr. A. Bunge (including Baron E. Toll) explored it in 1885-86. Toll revisited it in 1893 with Shileiko, and again in 1900 with F. G. Seeberg in the "Zarya." The Russian hydrographical expedition in "Taimir" and "Vaigach" in 1912 did some surveys in the New Siberian Islands; in 1913 it discovered Vilkitski Island and in 1914, Johkov Island. The "Maud" in 1924 visited the New Siberian Islands. (See ARCTIC REGIONS.)

NEW SOUTH WALES, a state of the Commonwealth of Australia, lying in the south-east, and occupying 309,432 sq.m. or 10.4% of the continent. From the east coast (Point Danger-Cape Howe, 700 miles) to the western boundary which runs for 240 miles along longitude 141° E., the average breadth is c. 650 miles. The northern boundary lies along lat. 29° S. and further east, along the Upper Darling (Barwon-Macintyre-Dumaresq) streams and thence along a crooked line of highland divide (Macpherson Range, etc.) to Point Danger. The southern boundary is formed by the middle and upper Murray to the head of the Indi (Forest Hill), thence in a straight line south-east to Cape Howe.

Physiographically four main divisions may be distinguished, corresponding to fairly well-marked climatic and economic areas.

(i.) **Eastern Highlands**, the most striking, as also the most decisive, of the relief features, consists of a belt of plateaux extending from the Macpherson Range on the north to the Australian Alps (q.v.) on the south. (See AUSTRALIA: *Geomorphology*; *Queensland*.) In the north the *New England Plateau* (c. 200 miles long, 70-80 miles broad, with c. 9,000 sq. miles lying above 3,000 ft.) rises in its centre to c. 5,000 ft.—Ben Lomond,

5,000 ft.; Mount Capoompeta, 5,100 ft.—sinks at either extremity to c. 4,000 ft.; Mount Lindsay (Macpherson Range), 4,064 ft.; Oxley's Peak (Liverpool Range), 4,500 ft.—and has considerable outliers, on the west the volcanic Nandewars (4,000 ft.) and Warrumbungle Range (3,000 ft.), and on the east and south the semi-detached spurs carved out by stream erosion into the likeness of ranges—Hastings, Mount Royal, Liverpool, etc., "Ranges." To the south of these ranges the plateau belt is broken across and the Central Plateau is separated from the more northerly by the remarkable Hunter River valley, the saddle at the head of which (near Cassilis) lies at c. 1,500 ft. The *Central Plateau* extends from this gap to the Lake George depression just north of the Federal Capital Territory. In general it repeats the features of the New England Plateau (cf. volcanic outliers on the west: Canoholas group, c. 3,000 ft.) but it is smaller and lower, few areas rising above 4,000 ft., and altitudes vary considerably. Its north-eastern section, the Blue Mountain Plateau, capped with (Triassic) sandstone, tilts from 4,000 ft. (west) to 700 ft. (east). From the Lake George fault-depression ("Senkungsfeld") to the border extends the *Southern Plateau*, a portion of the Australian Alps, a series of massive flattish-topped blocks diversified by (mainly north to south) down-faulted depressions (Mount Kosciusko, 7,328 ft.). Geologically this highland belt is characterised by its pre-vaingly ancient rocks (pre-Cambrian granites, folded Palaeozoics, etc.); by the volcanic flows (basalt, trachyte, etc.) which form cappings over considerable areas; by the extensive faulting which has differentiated levels, dislocated former drainage and resulted, in particular, in the abrupt scarps and declivities of the eastern flank; by the flattening by erosion (peneplanation) of the surfaces.

(ii.) **The Coastal Lowlands** belong structurally to the highland belt, being mainly, perhaps, down-faulted portions of it. The coast-line also appears in certain stretches (e.g., in the south) to be fault-determined. Almost everywhere the plateaux behind break away in sharp declivities and form steep backing walls often scarred by deep gorges. The coastal lowlands are mostly narrow (10–20 miles)—often mere deltaic fringes at river-mouths. In three places—around Sydney, Hunter River, Clarence-Richmond-Tweed rivers—they form roomier basins in which later rock-formations (e.g., Triassic) have been preserved. The Hunter-Goulburn Valley is a down-faulted trough worked out by erosion in weak strata and breaks across the highlands, running almost straight south-east to north-west for 120 miles to the Cassilis saddle (*v. sup.*) and is floored in its lower part with deltaic deposits. The structure of the Hunter Valley and of the Sydney Basin accounts for the outcropping of valuable coal seams. The coast-line, backed in many parts by bold heights, consists mainly of a succession of rugged promontories alternating with sandy bays and some inlets. In the central portion, on the other hand, subsidence has produced fine drowned valley harbours (Sydney, Port Stephens, Broken Bay, etc.).

(iii.) **The Western Slopes** are the "ramp" of the eastern plateaux, their uneven but relatively gentle declivity towards the great interior plains. In addition to outliers of the highlands (Mount Exmouth group, Curumbenya Range, etc.) the Cobar (c. 300 miles south-east-north-west; 150 miles wide; altitude 500–1,000 ft.) and Wyalong peneplains—worn-down relics of the buckled ancient floor which protrude through the later surface deposits—are the chief irregularities, though the streams have excavated long and broad transverse furrows.

(iv.) **The (Western) Plains** occupy all the remainder (nearly $\frac{2}{3}$) of the State except the north-west corner where the Barrier "Range" (c. 100 miles north to south; 30 miles east to west; altitude c. 1,000 ft. or 500 ft. above the surrounding plains) forms a series of hard etched and scarped ridges and resembles in structure the Cobar "peneplain." The immense plains—substantially the basins of the Upper Darling and a good part of that of the Murray—are floored with recent deposits (probably residuals of an earlier and wetter epoch). The western portions, and the older and higher of these deposits, are pre-vaingly red and are generally fertile. Black soils are found in the river valleys (e.g., middle Macquarie, Castlereagh, Namoi, etc.) and along the silted-up

courses of old streams. The streams, meandering, distributing, and flooding wide over these levels, are continually spreading fresh alluvium. The northern portion (80,000 sq. miles) reaching south-eastwards to Dubbo, falls within the Great Artesian basin, and the south-western parts (Riverina) fall within the Murray-River artesian area. In the former area bore holes vary from c. 90–4,340 ft. (av. c. 1,750 ft.), while 380 flowing wells discharge 80,780,000 gals. a day (maximum for single well, 1.5 million gallons).

Of the rivers the coastward-draining are relatively short, the Hunter and Hawkesbury, each c. 340 m. are the longest—rapid and constant-flowing streams, and owing to recent (Pleistocene and earlier) uplift, they are vigorously cutting back and excavating deep canyon-like gorges in the plateaux behind (cf. upper Macleay gorge, 3,000 ft. deep), creating wild and beautiful scenery and opportunities for the development of water-power. The lower basins are undulating to hilly with rich alluvial flats. Sand-barred mouths are common and also lagoon-like lakes (e.g., Lake Macquarie) due to damming of mouths by marine drift. (Cf. south to north current along the coast.) Few are navigable for any great distance and then usually for small craft only (e.g., Hawkesbury, 70 miles; Macleay, 39 miles; Shoalhaven, 22 miles). See also RICHMOND RIVER. The inward-flowing streams have been referred to. (See AUSTRALIA: Drainage.) Of the Murray, 1,200 miles are within New South Wales. Recent measurements have given the following results: Darling, length 1,702 miles, drainage area 221,700 sq. miles; Murrumbidgee, 981 and 10,700; Lachlan, 922 and 10,420; Macquarie, 590 and 10,090; Namoi, 526 and 9,820.

Climate.—Situating wholly in the temperate zone, New South Wales has a generally moderate climate. Average temperatures are higher by 5°–7° F in the north than in the south, and the range increases towards the interior, the mean daily range on the coast being c. 19° F, in the western plains c. 26° F. The transition zone between summer and winter rains passes diagonally (north-west to south-east) through the State. The area south-west of the line Broken Hill-Wagga-Albury receives winter rains mainly from Antarctic depressions ("lows"); the area north-east of a sinuous line running from the north-west corner of the State to Newcastle receives summer rains from tropical (monsoonal) "lows"; the intervening belt receives rain from both quarters and, in the east, from the passage of anticyclones ("highs") also. The east receives much more rain, and more uniformly, than the interior, the isohyetal lines except in the south and south-west running roughly parallel with the coast. The extremes are in the north-east corner (80 in. per ann.) and in the north-west (7 in.). Only 42% of the total area receives an average of over 20 in. per ann.; 15% receives less than 10 in. which is also more or less erratic. Heavy rains cause extensive flooding of the streams resulting often in serious loss; droughts are also a recurrent difficulty, especially in the interior. The rate of evaporation increases from c. 40 in. a year on the coast to c. 100 in. in the north-west with concomitant seasonal aridity and the drying up of streams. Four main climatic divisions, corresponding to the physiographic, may be distinguished: (i.) *Coast*: relatively high and regular rainfall coming mainly from the sea, with mild and humid conditions. Av. ann. temps., in the north 76°–57° F, in the south 68°–51° F; rainfall 30–80 in. per ann., greater in the north. (See LISMORE, NEWCASTLE, SYDNEY.) (ii.) *Tablelands*: cool and bracing climate with cold winters in the south; uniform and reliable rainfall. Average ann. temps.: in the north 70°–45° F; in the south 63°–38° F; av. ann. rainfall, 40 in. in the east to 30 in. in the west. (See BATHURST.) (iii.) *Western Slopes*: a drier, sunny and heathy climate with uniformly distributed rainfall. Temperatures are higher in the north, summer: 81°–73° F, winter, 53°–46° F; rainfall (av. ann.): 30 in. in the east, 20 in. in the west. North of the Lachlan the rains come from the north in February–May; the Riverina has light, but fairly reliable, winter showers. (See ALBURY.) (iv.) *Western Plains*: a dry climate, invigorating in winter, but liable to suffer from droughts, dust-storms and, more locally, from floods. Temperatures are higher in the north—av. ann.: summer 84°–75°; winter 54°–49° F. Av. ann. rainfall from 7 in. in the north-west; 10–15 in. along the Darling; 20 in.

in the east. (See *BROKEN HILL*.)

Economics.—The general facts relating to the distribution of minerals, soils and natural vegetation have been given under *AUSTRALIA* (*q.v.*). The clear physical differentiations indicated above, together with the stage of growth attained, give the economic development of New South Wales a marked regional character. Climate, relief, location of minerals and accessibility (*i.e.*, communications) are dominant factors in the distribution of the population. The following survey therefore proceeds upon the basis of four regions, *viz.*, Western Plains; Central Plains; Tablelands; Coastal Lowlands. The last three occupy belts roughly parallel with the coast-line and admit of subdivision into North, Central and Southern sections.

Western Plains, occupying the west and north-west portion (80,312,000 ac. = 125,487 sq.m. or $\frac{1}{3}$ of the State) west of the courses of the Lachlan, Marra, and Upper Darling (Barwon) rivers, has abundance of good soils but a poor and unreliable rainfall—8–10 in.; under 10 in. over $\frac{1}{4}$ of its area—and suffers occasionally from fierce heats, droughts, floods and always from introduced rabbits. Mining and pastoral pursuits alone have importance. In the north-west is Broken Hill (*q.v.*); the once-famous Cobar-Nymagee copper area, which is just included in the east, has suspended production, and opal mining (White Cliffs, etc., in the north-west; Lightning Ridge field—12,000 acres—in the north-east—is depressed (output 1926: £11,500). It is an area of isolation, "wide open spaces," large long-term leaseholds, over 63% of the total area being occupied by 196 holdings of over 100,000 acres each. The country produces fine-wooled merinos, but its carrying capacity varies greatly with the seasons and is generally low (40–130 sheep per sq. mile according to season, or $\frac{1}{4}$ of that of the lands further east). The livestock (1926) consisted mainly of 8,560,000 sheep, 100,000 head of cattle, 30,000 horses, and the total production (1925–26) of 65,000,000 lb. wool (less than $\frac{1}{4}$ of the total pastoral produce of the State); minerals and mineral products to value of £5,072,000. The total population is 44,500 (1 person per 3 sq. miles; without Broken Hill, 1 per 6 sq. miles) or 1.9% of the population of the State, Broken Hill alone accounting for 24,000. Apart from this the settlements consist mainly of collecting and distributing centres for pastoral areas situated on railway lines (Cobar, etc.), on rivers (Wilcannia, Wentworth), or on both (Bourke, population c. 1,000; Walgett, Menindee, etc.) besides isolated stations and mining camps. Railways link Bourke, Cobar, Walgett and other towns on or near the eastern boundary—rivers with the eastern parts of the State and with Sydney, and the recently completed line from Sydney to Broken Hill (Condobolin-Ivanhoe-Menindee) traverses the heart of the area (east to west) and should help to develop much territory. Though increasingly tapped by railways the Darling still carries traffic (*e.g.*, wool to South Australia) in good seasons, and for the rest transport is by camel etc., train—increasingly by motor—over rough tracks.

The Central Plains form a natural extension of the western, large portions of them being little distinguished as regards relief from the latter. Thus in the north-west they comprise the low flat lands stretching east of the Barwon-Marra rivers, and in the south-east the broad Riverina plains are only divided from the western plains by the Murrumbidgee and Lachlan rivers. Further east the land slopes gradually up, but, except in the centre (Cobar-Wyalong area) there is little above 1,000 ft. and few rugged features. But its rainfall, though rather scanty and unreliable, is better than that further west (15–24 in., the greater quantity in the north—18–28 in.—being balanced by greater evaporation). The rivers from the highlands further east stream across these lowlands but are of no great service, being irregular in flow, entrenched in places, and liable to flood. Artesian supplies have proved a great boon and have been extensively exploited, especially in the north-west and south-west. The soils, red-brown loams and black soils, are good but the latter are very heavy and have only recently begun to be worked. Of the total area (*c.* 41,420,000 ac. = 64,719 sq.m.) some $\frac{1}{3}$ are occupied, of which 62% has been alienated from the Crown, and though holdings of 10,000 acres and upwards account for 19% (89 over 50,000 ac. each), medium

to small-sized holdings are common further east and particularly in the Riverina. The area, in fact, forms a climatic and economic transition zone. In the west pastoral pursuits; in the east, mixed agriculture and grazing; in the Riverina and a few other parts agriculture alone, or dairying alone, are practised. The area contains 40% of the agricultural lands of the State; and in the north-west and south-west portions are some of the best sheep-lands. Along the east the fringes of the wheat-belt are included. The 10 in. winter rainfall line (7 months: April–October, the growing season) runs roughly down the middle (north-north-east–south–south-west) of the area, and to this the wheat "frontier" approximates, falling behind it in the north-east but overstepping it to the extent of 5,000,000 acres and pushing forward into rainfall areas of 8–9 in. (April–Oct.) in the centre and particularly in the south-west (Riverina). Thus, while grazing, with a little mixed and other farming, predominates in the north, mixed farming—mainly sheep and wheat—arable farming, fruit-growing (vines, etc.) and dairying increase in importance in the south. A special place, in virtue of its irrigation areas, and its wider range of possibilities, is taken by the Riverina (*q.v.*). The total live-stock amounted (1926) to 18,413,000 sheep, 300,000 cattle, 132,000 horses, 12,000 dairy cattle, but the numbers vary greatly according to season (*e.g.*, sheep: 1891, 25,000,000; 1921, 14,000,000; dairy cattle: 1911, 48,000). Similarly the sheep-carrying capacity, though high (266.6 per sq. mile) varies from 351–205 per sq. mile. The total production of the area (1925–26) amounted to: wool, 136,500,000 lb.; wheat, 11,400,000 bu.; butter, 216,000,000 lb.; minerals, etc., £672,000. With a total population of 115,640, the area has a population density of 1.8 persons per sq. mile. The chief settlements, apart from the pastoral river centres common to this and the Western Plains (Walgett, Hillston, Balranald, etc.), are centres of mixed pastoral and farming areas: Moree (3,300), Narrabri—a thriving railway junction town in a sheep, dairy, and fruit area, with butter factories and freezing works—and Coonamble in the north, Nyngan and Condobolin in the centre, and a large number of similar settlements in the Riverina.

The Western Slopes consist in the main of gently rolling country which rises from levels of under 1,000 ft. to elevations of over 2,000 ft. and merges into the plateaux to the east. It is essentially the zone of the upper, and fairly roomy, basins of the western rivers, but in the north-west and south-west the narrower head-water valleys and plateau margins are included in the administrative division. The rainfall is abundant and also fairly reliable (19–34 in.—rather more in the north, 24–33 in., more varied in the south where the Australian Alps are approached: 16–40 in.). The outcrops of ancient rocks along these slopes, as also the stream-beds descending over them, have yielded rich stores of minerals, and Forbes, Temora, Wyalong, Grenfell, etc., were once famous mining centres. Some gold-mining is still carried on, tin is obtained at Ardlethan, chrome iron at Gundagai, and a little coal is worked near Gunnedah. But in general mining has been succeeded by agriculture as the value of the red soils for wheat has become known. Out of the total area, 28,164,000 ac. (*c.* 44,000 sq. miles) $\frac{1}{4}$ is occupied. Wheat, needing dry summers and an optimum growing-season (April–Oct.) rainfall of 11–15 in., finds these conditions in a belt *c.* 500 miles long (north-west–south-east), about 100–130 m. wide, and limited on the east by a line about 120 m. from the coast, the coastal portions having proved too humid. Within this belt are 53,000,000 ac. of which about 26,000,000 ac. seem capable of cultivation, and of this $\frac{1}{4}$ would normally be used for growing wheat-hay (fodder). The area of possible wheat cultivation has greatly increased, nearly 20,000,000 additional acres having been occupied for this purpose in 1904–22. The total area actually cultivated to wheat (1926) is about 8,000,000 ac., about one-half of which is under wheat at any time. Fruit-growing and dairying are also carried on, and along some of the rivers irrigation also (*e.g.*, Forbes, Dubbo, Ardlethan). Grazing (mainly sheep) is everywhere important. The great bulk of the holdings within the area lie between 100 and 3,000 acres. Livestock total: sheep, 15,670,000 with the very high average density of 389 per sq.m.; cattle, 416,000;

horses, 197,000; dairy cattle, 41,000. In addition to primary production there are butter-factories, freezing works, flour and saw mills, etc., and in certain railway centres (e.g., Junee, Quirindi) are large railway engineering works. The total population (1926) was 205,190 (4.7 per sq. mile). The towns (Tamworth, 6,000; Dubbo, 5,150; Forbes, 4,700; Parkes, 4,260; Junee, Cootamundra and Temora, c. 3,500) are mainly centres for agricultural and pastoral producing areas, adding often the functions of railway junctions, mining, and (on a small scale) industrial centres. Production (1926): wool, 114,457,000 lb.; wheat, 20,334,000 bu.; butter, 6,298,000 lb.; minerals and manufactures, £1,493,000.

The Tablelands extend to the east of the above division and are bounded on the east almost everywhere by abrupt and often rugged and precipitous declivities. They include much level or rolling country capable of cultivation but much, especially in the south (Alps, Australian, *q.v.*), is too rough for anything but grazing. The climate is also cool or cold and, though bracing, tends to be wet. (Rainfall, 24–53 in.; in the north 30–38 in.; in the south 19–65 in.) Mining, formerly extensive, is still important. The tin resources of the Northern Plateau (Tingah, Emmaville) are actively exploited; silver ores of high quality are mined at Yerranderie (Burrangorang Valley); gold is mined at various places: Bathurst, Uralla, etc.; the iron deposits of Cadia (reserves 10,000,000 tons) and Carcoar are utilised in the industries of Lithgow (*q.v.*) and smaller deposits exist at Goulburn and Queanbeyan, while the most westerly outcrops of the Sydney Basin coal deposits crop out and are worked at Lithgow. Of the total area (26,480,000 ac. = 41,725 sq.m.) about 77% (20,000,000 ac.) is occupied, but less than one-half is alienated from the Crown. The climate is, in general, too damp for wheat but such as is grown is also found mainly in the central area. Sheep-grazing is carried on from north to south, though the central parts lead in this also. The highlands favour a different type of sheep from the Plains—not so robust but of exceptionally fine and dense wool. The New England wool, being reputed to be one of the best of all spinning wools, and the Southern Tablelands (e.g., Monaro district) are also noted. The area carried (1926) 10,219,000 sheep (214.7 per sq.m.); 438,000 cattle; 110,000 horses, and 45,000 dairy cattle. Apart from Lithgow (*q.v.*) manufacturing industries are confined mainly to the larger towns (flour milling, tanning, soap-making, railway engineering, etc.), but the noted beauty of the scenery and the relative coolness of summer attract numerous visitors and in the areas within easy railway reach of Sydney and Newcastle the tourist industry is important. The total population is 230,000 (5.5 per sq.m.) but it is mainly concentrated in certain localities, wide areas being relatively bare. The towns and settlements are centres for pastoral, agricultural, and mining districts; many are tourist centres as well, while some are also railway-junction towns with a certain industrial activity. In the Northern Plateau, Armidale (*q.v.*: pop. 5,750), Glen Innes (4,500) and Tenterfield are on the main northern railway line (Sydney to Brisbane) and combine most of these functions, serving as holiday centres especially for Newcastle and the north coast towns. On the highlands west of Sydney (Blue mountains) holiday and tourist resorts are more important—Katoomba (10,000); Goulburn (12,000), also an agricultural centre with some industries—while further west, Bathurst (*q.v.*, 9,400) and Orange (8,000) combine this with the other functions mentioned. Further removed, such towns as Cowra (4,300), Young (3,500), Mudgee (3,000), Wellington (3,340) are rather more agricultural and pastoral (wheat and sheep) centres and belong almost as much to the Western Slopes division. Lithgow (*q.v.*, 16,400) with its iron, steel and other industries stands rather apart as an outlier of the coastal industrial areas.

Production.—In 1926 production was: wool, 79,230,000 lb.; wheat, 2,100,000 bu.; butter, 4,136,000 lb.; minerals, £1,322,000; manufactures, £2,687,000. The Federal Capital Territory falls within this area (see CANBERRA) and was formerly mainly devoted to grazing (sheep). On the edges of the southern tableland (west of Yass) is the famous Burrinjuck dam, the head-works of an important Riverina (*q.v.*) irrigation scheme.

The Coastal Lowlands, irregular, broken and detached patches or mere strips scattered and stretched along the eastern margins, are yet economically and in general social respects perhaps the most important regional element in the State. Relatively small in extent (22,237,000 ac. = 34,745 sq.m.) they contain 1,770,000 inhabitants (75.7% of the total population; 43.4 per sq.m.); the great majority of large towns, including the capital; nearly all the coal-fields and manufacturing areas; all the sugar-growing, the bulk of the dairying and maize-growing areas, besides all the sea-ports, with the financial and commercial nerve-centres of the State. The largest, and also the most important, individual areas are the Sydney and Hunter River lowlands in the centre, the Clarence-Richmond-Tweed basins in the north, and the Illawarra district in the south. These are described separately (see SYDNEY, SINGLETON, RICHMOND, WOLLONGONG) and a general survey alone is given here. The climate is mild and humid, and distinctly warmer in the north (rainfall: 30–62 in.; 35–76 in. in the north, 27–61 in. in the south). Apart from river-bottoms and some coastal flats, the terrain is hilly or broken and the cultivable area is small, and of this area less than a quarter was cultivated in 1925–26. The broken lands—tableland scarps, valleys, foothills, etc.—are valuable for mining (e.g., Clarence Valley) and the intersection and laying bare of coal-seams by river action and coastal faulting is a fact of importance. The extensive timber resources have been greatly depleted, though some is still cut in the Northern and Hunter valleys. In many parts the topography and climate offer facilities for water-power development (*cf.* Nymboida-Clarence scheme), while the rougher interior country is also used for cattle. Wheat and sheep are virtually excluded by the dampness of the climate, but 95% of the holdings used for dairying are in this area. All the sugar grown in the State is cultivated in the northern districts (1926: 19,400 ac.). Considerable quantities of fruit are grown—tropical fruits in the north, vines, oranges, etc., in the (north-east) Hunter valley and in the Sydney Basin—and mixed agriculture is practised (maize, lucerne, potatoes in the north and centre). Live-stock (1926): cattle, 1,000,000; dairy cattle, 795,000; horses, 203,000; sheep, 996,000. The holdings are comparatively small: 400–500 acres. The outcropping of coal in convenient positions has given rise to a coal-mining and coal-exporting industry (see BULLI, MAITLAND)—in 1928 very depressed—and more recently to growing manufacturing industries centred chiefly in or near Newcastle, Sydney, Port Kembla (*q.v.*). Here is the chief and growing industrial “hub” of the Commonwealth. Here, also, are the financial and commercial headquarters—the central banking, wool-broking, railway and shipping, political and social organisations—of the State. Of ports, Sydney and Newcastle—the former good, the latter indifferent as a harbour—are the most important, but Grafton (a river port), Coff’s Harbour and Byron Bay in the north have actual importance or possibilities as outlets for local trade and the same applies to Port Stephens as a possible outlet for the Lower Hunter district. Jervis Bay is the destined site for the port of the Federal Capital. Associated with the coasts are also fishing (mainly in the northern estuaries and lakes; 1926: £556,000), and the tourist and holiday-resort industries. Of the total population of the area (*v. sup.*) Sydney alone accounts for 1,101,200, and a further 200,000 are contained in the Sydney Basin (Cumberland County). The lower Hunter Valley and coasts immediately north of it (*i.e.*, substantially the Newcastle [*q.v.*]-Maitland [*q.v.*] district) count a further 280,000. Of northern towns Lismore (*q.v.*, 9,300), Grafton (4,800), Casino (3,450) are important local centres, while in the south, Nowra, Wollongong, Kiama are local exporting centres and health resorts. Production (1925–26): butter, 94,334,000 lb.; wool, 7,075,000 lb.; minerals, £8,051,000; manufactures, £5,7625,000.

Statistical Summary. *Area*—excluding Federal Capital Territory; including 176 sq.m. of harbours—309,432 sq.m., 10.40% of total area of Australia.

Population (March, 1928): 2,414,000; 7.80 per sq.m.; c. 39% of Commonwealth; rate of increase (1926), natural 1.34%; natural+immigration 2.14%; metropolitan 45.6%; 99% of area contains only 655,300 inhabitants.

Occupations (Census 1921: total population 2,101,968; main classes only); *Breadwinners*: 42.29%; *Primary Producers*: 9.98% (agricultural, 4.52%; pastoral and dairying, 3.14%; mining, 1.57%). *Industrial*, 13.62%. *Commercial and Transport*, 16.68%.

Production (1925-26): Total, £160,615,000. *Primary Industries*: £95,777,000 (pastoral, £42,369,000; agricultural, £20,741,000; dairying—including pigs, bees, poultry—£14,712,000; mining, c. £12,000,000; forests, fisheries, etc., £5,609,000). *Manufacturing Industries*: £64,838,000. Production per head of population: *Primary*: £41.13.8 (pastoral, c. £18; agricultural, £9; dairying, £6.8; mining, £5.7.6). *Manufacturing*: £28.4.4. *Total*: £68.18.0.

Pastoral Industry (1926): *Sheep*, 54,630,000 (highest since 1891, 61,831,000) including 45,560,000 merino; *Wool*, 495,820,000 lb. = £35,377,000 (at Sydney); average weight of clip, 8.1-8.8 lb. *Cattle*: 2,937,000 (including 632,000 dairy cattle). *Horses*: 651,000. *Milk*: 290,000,000 gal. *Butter*: 107,000,000 lb. *Cheese* c. 6,500,000 lb.

Agriculture: Area under cultivation (1926): c. 11,100,000 ac. (crops alone, 4,550,000 ac.) *Wheat*, 3-3.5 mill. ac.; 28.6-66.7 mill. bu.; £6.7-£16.7 mill. = 31-58% of total agric. produce. *Hay*, 750,000-1.1 mill. ac.; 866,000-1.6 mill. tons; £5.5-£8.9 mill. = 23-41%. *Maize*, 120,000-166,000 ac.; 3.28-4.6 mill. bu.; £630,000-894,000 = 2-4%.

Mining: Total value of all minerals produced to end of 1926 = c. £400,000,000. Total output (1926), £12,000,000; (silver-lead, £4,400,000; zinc, £1,360,000); coal, c. £9,500,000 (northern fields, c. £6,800,000; southern and western, etc., c. £1,600,000).

Manufacturing Industries (1911 and 1925-26): *Factories*: (1911) 5,000; (1925-26) 8,200. *Employees*: 66,000 and 174,000 (= 3.7% increase, cf. 2.0% increase of population as a whole). *Raw materials and fuel*: £15,600,000 and £105,125,000. *Value of output*: £25,700,000 and £170,000,000. *Employees*: Metallurgical and machinery, 45,000; clothing and textiles, 35,000; food, drink, etc., 21,000.

Communications—Railways: Total mileage open 1926 (including Federal and private lines), 6,218 miles (4 ft. 8½ in. gauge, 5,710) = 1 m. railway per 374 inhabitants or per 50 sq. miles. *Av. ann. increase of mileage*, 155.38 miles. *Total capital expended* (1926), £105,238,000. *Net earnings*: £4,419,000 = 4.30% interest on capital invested.

Trade: Total (1921-1926), £91-127 mill. (*Imports* £43-£72 mill.; *Exports* £42.5-60.5 mill.) *Per head of population*: £43-£60 (*Imports*: £20-34; *exports*: £19.10-£27).

Exports: *Wool*: £21-£25 mill. = 45-50% of total exports.

Wheat and Flour: £5.8-£7.85 = 11-17%. *Meat, hides, leather, etc.*: £5.5-£6.7 mill. = 12-13%. *Butter*: c. £2 mill. = 3-4%. *Coal*: £1.4 mill. (falling) = 3-1.7%. *Other Minerals*: c. £3 mill. = 5-6.5%. *Total pastoral products* £36,500,000 = 58.1% of total over seas exports.

Shipping (all classes): c. 3,000 vessels; 9 mill. registered tonnage, discharging 3.5-4 mill. tons and shipping 5-5.6 mill. tons cargo.

Social Conditions: *Hospitals*: private: 620 (beds: 4,940); public, 159 (9,229). *Total (Government) expenditure on charitable relief* (1925-26): £5,825,000 = £2.10.9 per head of population. (*Maternity allowances*: £270,000; *State wards [children]*: £500,000; *Hospitals, asylums, etc.*: £820,000; *pensions*: £3.5 mill.). *State advances for building homes* (1926): £1,620,000. *Parks, recreation grounds, etc.*: 240,000 ac.

Education: *Schools* (1925): public, 3,162; private, 696. *Pupils*: public, 336,800; private, 82,200 = 92% of those requiring instruction. (O. H. T. R.)

HISTORY

Early History.—New South Wales was discovered by Captain Cook on April 20, 1770 (see AUSTRALIA). On Jan. 20, 1788, the "Sirius," commanded by Captain Arthur Phillip, R.N., reached Botany Bay with an armed trader, three store-ships and six transports. The persons on board the fleet included 40 women, 202 marines of various ranks under Major Ross, five doctors, a few mechanics, and 756 convicts. The live stock consisted of

one bull and four cows, a stallion and three mares, some sheep, goats, pigs and a large number of fowls. The expedition was well provided with seeds of all descriptions. As Botany Bay was found unsuitable, the settlement was transferred to Port Jackson, near the present site of Sydney. Later on, other convict-ships arrived; and, in 1793, came the first free settlers, who were presented with grants of land. By 1800 the population was 5,000.

In 1809 Captain Macquarie became governor, and, during his administration, New South Wales was transformed from a penal settlement to a colony. Schools and churches had already been erected, a newspaper, the *Sydney Gazette and New South Wales Advertiser*, had been started, and attempts made to acclimatize the drama. Macquarie was the first governor to open up the country. He formed roads and built bridges in the districts along the coast, and commenced a track across the Blue Mountains. Attracted by the success of Captain John M'Arthur with merino sheep, more free settlers began to arrive in 1817; but not until the governorship of Sir Richard Bourke (1831-37) did they obtain trial by jury, free press, a legislature with very limited representation, free grants of land, and religious equality. Settlement had progressed at a rapid rate. Parramatta, Richmond, and Windsor were founded before 1798, and Newcastle, Maitland, and Morpeth early in the 19th century; but the towns of the interior, Goulburn, Bathurst, and others were not begun till about 1835. Then, again, the explorations which followed the passage of the Blue Mountains opened up a large portion of South-Eastern Australia. By 1840, owing to the formation of other colonies, New South Wales, which originally signified the mainland of Australia and the islands in the South Pacific, comprised only the three eastern states of today. Sale by auction of the public lands was now substituted for free grants; and squatters were allowed to occupy sparse areas on payment of a small annual licence. In 1851, when Victoria became a separate colony, the population of New South Wales had risen from the 76,793 of 1837 to 187,243, and the annual exports amounted to £2,309,580. In 1851 also, gold was discovered near Bathurst by E. H. Hargraves, and transportation was at last abolished.

The New Constitution Bill was passed in 1853, and two years later, approved by the British Parliament. The Bill provided for an elected assembly and a nominated council; vote by ballot was introduced; the number of members in the assembly was increased to 80, and the franchise was granted to every adult male after six months' residence. The census of 1857 gave the population of Sydney and suburbs as 81,327. In 1859 Queensland was constituted a separate colony.

From 1861 to 1888.—After 1861 the land policy was entirely revised. Sir John Robertson, in his Land Bill, introduced the principle of deferred payments for the purchase of crown lands. Residence and cultivation were considered more important than a sufficient price. After much opposition the measure was passed and the other colonies adopted similar legislation. The distinction between the descendants of convicts and the descendants of free settlers was now finally abandoned. In 1862 a large force, military and police, was despatched to Lambing Flat, in order to protect the Chinamen from ill-treatment by the miners. At this time bushranging became frequent, and only with great difficulty was stamped out.

H.R.H. the duke of Edinburgh visited the colony in 1868. An attempt was made upon his life by a man named O'Farrell, who was subsequently hanged. A census taken in 1871 showed that the population was 503,081, and the exports £11,245,032. During the governorship of Sir Hercules Robinson (1872-79) the Fiji Islands were annexed; telegraphic communication with England and mail communication with the United States were established, and a coalition between Sir Henry Parkes (premier and colonial secretary) and Sir John Robertson at length made it possible to develop some continuous policy. The census of 1880 gave the population of the colony as 751,468, of whom 411,149 were males and 340,319 females. In this year the railway to Melbourne was completed, and in 1883 valuable deposits of silver were discovered at Broken Hill. In 1885 the British Government accepted the offer of a contingent from New South Wales to aid the imperial

troops in the Sudan. The railway to Queensland was opened in 1888 by the new governor, Lord Carrington. In the same year the government prevented the landing of some Chinese passengers and passed laws practically prohibiting the immigration of Chinamen.

Federation.—In 1889, the premier, Sir Henry Parkes, gave his support to the movement for Australasian federation, and New South Wales was represented at the first conference held in Melbourne at the beginning of 1890 (see AUSTRALIA). Early in 1891 the great strike, which at one time had threatened to paralyse the trade of the colony, came to an end. A board of arbitration and conciliation to hear and determine labour questions and disputes was formed, and by later legislation its powers were strengthened. (For labour legislation see AUSTRALIA.) The census of 1891 showed that the population was 1,134,207, of whom the aborigines numbered 7,705 and the Chinese 12,781. In 1893 a financial crisis resulted in the suspension of ten banks; but with two exceptions they were reconstructed, and by the following year the effects of the depression had passed away. In 1896 a conference of Australian premiers was held at Sydney to consider the question of federation. The then premier, Mr. Reid, was rather lukewarm, as he considered that the free-trade policy of New South Wales would be overridden by its protectionist neighbours. But his hand was to a great extent forced by a People's Federation convention held at Bathurst, and, ultimately, a considerable majority in favour of federation was obtained.

From 1899 to 1927.—During the South African War (1899–1902) New South Wales sent 314 officers and 5,796 men, more than one-third of the total number raised by Australia. In spite of the great drought of 1902, the state made progress, and during the period 1901–14 the cultivated area was almost doubled. Scientific breeding of wheat and dry-farming were important factors in this increase. The protectionist policy of the Federal Government helped the manufacturers, and the change from free trade did not appear to injure the prosperity of the country.

The influence of the Labour Party was manifested in the adoption of laws extending the arbitration system, and from 1906 "assisted immigration" became its accepted policy. In 1912 fruit-growing began in the irrigation area of the Murrumbidgee. After 1918 a policy of closer settlement for ex-service men was initiated and further encouragement given to immigration from Great Britain.

The railway strike of 1917 had far-reaching effects: it raised legal and constitutional questions of importance and caused, ten years later, the downfall of the Labour Ministry. In 1925, Mr. Lang, the Labour premier, had instructed the Railway Commissioners to reduce in rank the men who had not taken part in the strike. The arbitration court forbade the Commissioners to carry out the premier's instruction. Thereupon Mr. Lang introduced his Railway Bill to annul the decision of the court. This was passed in the assembly but rejected by the legislative council. As the council is a nominated body, Mr. Lang recommended to the governor that twenty-five new members (all pledged to support the bill) should be added to its number. The recommendation was, after some demur, accepted, but, when a further bill was brought forward to abolish the council, some of the new councillors refused to die for the party and the bill was rejected by 47 to 41. Public meetings were held protesting against the actions of Mr. Lang. The press suggested a referendum or a general election, and when in 1927 a general election did take place the Labour government was defeated by a Nationalist and Country Party coalition.

(H. D. N.)

NEWSPAPERS (see also COPYRIGHT, LIBEL, CONTEMPT OF COURT). For legal definition of newspapers in the strict sense reference should be made to the article on PRESS LAWS, but for the purpose of this article the term comprises daily or weekly publications mainly concerned with the reporting, illustrating and commenting upon current events. (For magazines and the like see PERIODICALS.)

Early History.—In the days before printing the earliest equivalent of the modern newspaper was the series of public announcements called *Acta Diurna* issued during the Roman empire

and posted up in the same way as the French postal *affiches* of to-day and copied by scribes for dispatch to provincial subscribers. A like series of official reports was made in China as early as the 7th century, but in a general sense right up to the invention of printing (*q.v.*) the dissemination of news in all countries was by the slow process of word of mouth and by private letter. After the discovery of printing pamphlets or single sheets announcing some item of news were often issued.

It is now generally supposed that the first of them to be published regularly was a German publication the *Avisa Relation oder Zeitung*, first printed in 1609. Then came the Antwerp *Nieuwe Tijdingen* in 1616, and in May 1622 appeared what is now conceded to be the first English newspaper proper, *The Weekly Newses from Italy, Germany, etc.*, London, published by Nicholas Bourne and Thomas Archer. These enterprising editor-publishers, however, had a formidable competitor in Nathaniel Butter, a freeman of the Stationers' Company, who in June 1605 had momentarily satisfied the public demand for sensation, as greedy then as it is now, by reports of two dramatic murder trials in Yorkshire, one of which was the Calverley case. Butter had published *Newses from Spain* in 1611, and when the *Weekly Newses* appeared he almost immediately brought out a rival quarto sheet named *Newses from Most Parts of Christendom*, and its success was so great that a Butter-Archer fusion followed. Their joint production was called the *Newses of the Present Week*. It must not be assumed that during the whole period this journal was published regularly every week, but it is the earliest continuous English newspaper, so far as known to historians. In 1638 Charles I. gave Butter the right of publishing foreign news on payment of £10 a year towards the repair of St. Paul's cathedral, but in the following year he fell under the displeasure of the licenser of the press. Despite the latter's decree of suppression Butter brought out his paper all the same, and he lived to a great age, dying in 1664. Archer had died in 1634.

I. BRITISH NEWSPAPERS¹

In the reign of Queen Elizabeth the news writer was well established. Formerly he did not fulfil an independent calling but was a retainer in the service of some great noble whom he kept equipped with such intelligence as his master required, but the gradual spread of learning led to a demand, especially in districts remote from London, for a regular supply of news. For a long period the purveyors of these letters, who must be regarded as journalists, syndicated (to use an expression familiar to modern journalism) their information in manuscript form, and there was more than one organisation for the interchange of letters between London and the provinces. Of these early news-letters good examples are in the *Paston Letters* and the *Sydney Papers*.

First Newspapers.—It was at one time believed that the earliest regular English newspaper was an *English Mercurie* of 1588, said to have been printed in the year of the Spanish Armada. Copies are in the British Museum, but it was afterwards proved that these early copies in mss. and print were forgeries.

There is in the British Museum a *Mercurius Gallobelgicus*,¹ the work of D. M. Janson, of Cologne. A fairly thick octavo book, giving a Latin chronicle of events from 1587 to 1594, it is really a sort of annual register. It was continued down to 1635. The *Mercurius Gallobelgicus* is chiefly interesting because, by circulating in England, it started the idea of a periodical supplying foreign news, and apparently became to English contemporaries a type of the newfangled news-summaries; and the title *Mercurius* or *Mercury*—as representing the messenger of the gods—thus became a common one for English periodicals. On June 1st, 1619, Ralph Rounthwaite entered at Stationers' Hall *A Relation of all matters done in Bohemia, Austria, Poland, Sletia, France, etc., that is worthy of relating, since the 2nd of March 1618 (1619 N.S.) until the 4th of May*. Again at the beginning of November 1621 Bartholomew Downes and another entered in like manner *The certaine and true newes from all parts*

¹In the following section have been incorporated certain sections of the articles by E. Edwards in the 9th edition and by H. Chisholm in the later editions of the *Encyclopædia Britannica*.

of Germany and Poland, to this present 20 of October 1621. No copy of either of these papers is now known to exist. But in May 1622 we arrive at a regular weekly newspaper which may still be seen in the British Museum, the *Weekly Newes* of Archer and Bourne referred to above.

Freeing the Press.—The first periodical with a title was a *Mercurius Britannicus* published by Archer (1625; the earliest copy in existence being No. 16, April 7), which probably lasted till the end of 1627. But the activity of the newspapermen was checked by the Star Chamber edict in 1632 against the printing of news from foreign parts. The next step in the evolution of the newspaper was due to the abolition of the Star Chamber in 1641, and the consequent freeing of the press; and at last we come to the English periodical with domestic news. In November 1641 begins *The Head of severall proceedings in the present parliament* (outside title) or *Diurnal Occurrences* (inside title), the latter being the title under which it was soon known as a weekly; and on Jan. 31, 1642 appeared *A Perfect Diurnal of the Passages in Parliament*. These were printed for William Cooke, and were written apparently by Samuel Pecke, "the first of the patriarchs of English domestic journalism" (J. B. Williams). The weekly *Diurnals* were on the side of the parliament until in Jan. 1643 appeared at Oxford the first Royalist diurnal, named *Mercurius Aulicus*, a *Diurnal communicating the intelligence and affaires of the Court to the rest of the Kingdome* (continued till Sept. 1645, and soon succeeded by *Mercurius Academicus*), which struck a higher literary note. It was conducted by Sir John Berkenhead, a Fellow of All Souls, whose style is said to reflect that of the Parliamentary oratory of his day. He afterwards became master of requests. *Mercurius Civicus*, the first regularly illustrated periodical in London, was started by the parliamentarian Richard Collings on May 11, 1643 (continued to Dec. 1646); Collings had also started earlier in the year the *Kingdome's Weekly Intelligencer*, which lasted till Oct. 1649. In September 1643 appeared another Puritan opponent of *M. Aulicus* in the later *Mercurius Britannicus* of Captain Thomas Audley, which in September 1644 was taken over and continued for nearly two years by Marchamont (or Marchmont) Nedham. Nedham was a master of invective and one of the earliest to change sides when it suited him. From Oct. 1649 to June 1650, by a new act of parliament, the licensed press itself was entirely suppressed, and in 1649 two official journals were issued, *A Brief Relation* (up to Oct. 1650) and *Severall Proceedings in Parliament* (till Sept. 1655), a third licensed periodical, *A Perfect Diurnall* (till Sept. 1655), being added later in the year, and a fourth, *Mercurius Politicus* (of which Milton was the editor for a year or so and Nedham one of the principal writers), starting on June 13, 1650 (continuing till April 12, 1660). After the middle of 1650 there was a revival of some of the older licensed news-books; but the *Weekly Intelligence of the Commonwealth* (July 1650 to Sept. 1655), by R. Collings, was the only important newcomer up to September 1655, when Cromwell suppressed all such publications with the exception of *Mercurius Politicus* and the *Publick Intelligencer* (Oct. 1655 to April 1660), both being official and conducted by Nedham.

Till Cromwell's death (Sept. 3rd, 1658) Nedham reigned alone in the press, but in 1659 a rival appeared in Henry Muddiman (a great writer also of "news-letters"), whose *Parliamentary Intelligencer*, renamed the *Kingdom's Intelligencer* (till Aug. 1663), was supported by General Monk. Nedham's journalistic career came finally to an end (he died in 1678) at the hand of Monk's council of state in April 1660. His successor, Muddiman, was supplanted in 1663 by Sir Roger L'Estrange, formerly a Royalist cavalry officer who narrowly escaped execution during the commonwealth; he was appointed "surveyor of the press." On him was conferred by royal grant—as it proved, for only a short period—"all the sole privilege of writing, printing and publishing all narratives, advertisements, mercuries, intelligencers, diurnals and other books of public intelligence; . . . with power to search for and seize the unlicensed and treasonable schismatical and scandalous books and papers." L'Estrange discontinued *Mercurius Politicus* and *Kingdom's Intelligencer* and substituted

two papers, the *Intelligencer* (Aug. 1) and the *Newes* (Sept. 3) at a halfpenny, the former on Mondays and the latter on Thursdays; they were continued till Jan. 29, 1666, but from the beginning of 1664 the *Intelligencer* was made consecutive with the *Newes*, numbered and pagged as one.

The London Gazette.—The first number of the bi-weekly *Oxford Gazette*, licensed by Lord Arlington and written by Muddiman, was published on Nov. 16, 1665. It was a "paper" of news, of the same size and shape as Muddiman's news-letters. With the publication of the 24th number (Monday, Feb. 5, 1666 O.S.) the *Oxford Gazette* became the *London Gazette*, which has appeared twice a week, on Tuesdays and Fridays, ever since as the official organ of Government. After the Revolution of 1688 the press censorship was relaxed, being finally abandoned in 1693, and a number of newspapers came into being, including the *Universal Intelligencer*, *English Courant*, *London Courant*, *London Mercury*, *London Intelligencer*, *Orange Gazette*, *Flying Post*, *Post-Boy*, a daily which lasted only four days, and the *Lincoln Rutland*, and *Stamford Mercury*, now the oldest of the provincial papers. In 1699 appeared the *Edinburgh Gazette*, a bi-weekly, and in 1702 the *Daily Courant*, the first English daily, a small sheet printed on one side only, the editor-printer of which confined himself to news and not views.

Defoe and Lloyd.—It is Daniel Defoe who is the first English journalistic writer of national importance. In Feb. 1704 he began his weekly, *The Review*, which eventually was printed three times a week and was a forerunner of the *Tatler* (started by Steele in 1709) and the *Spectator* (started by Steele and Addison in 1711). Defoe's *Review* came to an end in 1713, and between 1716 and 1720 he published a monthly with an old title, *Mercurius Politicus*. By some authorities Defoe is considered the originator of the serial story.

The *Examiner*, which was started in 1710 as the chief Tory organ, enjoyed as its most influential contributor Swift, the father of the leading article. Edited by Dr. William King, afterwards principal of St. Mary's hall, Oxford, this political journal had brilliant contributors in Bolingbroke, Prior, Atterbury and Arbuthnot. Swift had control of the journal for 33 numbers between November, 1710, and June, 1711, but on becoming dean of St. Patrick's he gave up regular journalistic work. There followed a number of other political journals, such as the *Craftsman*, the *Whig Examiner*, and the *Medley*.

In 1696 Edward Lloyd—the virtual founder of the famous "Lloyds"—started a thrice-a-week paper, *Lloyd's News*, which had but a brief existence in its first shape, but was the precursor of the *Lloyd's List* of the present day. No. 76 of the original paper contained a paragraph referring to the House of Lords, for the appearance of which a public apology must, the publisher was told, be made. He preferred to discontinue his publication (February 1697). Nearly thirty years afterwards he in part revived it, under the title of *Lloyd's List*—published at first weekly, afterwards twice a week (see F. Martin, *History of Lloyds*, 66–77 and 107–120). This dates from 1726. It is now a daily.

Stamp Tax of 1712.—The increasing popularity and influence of the newspaper press could not fail to be distasteful to the government of the day. The paper which seems to contain the first germ of the newspaper tax is still preserved amongst the treasury papers, and probably belongs to the year 1711. "There are published weekly," says the writer, "about 44,000 newspapers, viz., *Daily Courant*, *London Post*, *English Post*, *London Gazette*, *Postman*, *Postboy*, *Flying Post*, *Review* and *Observer*." ("A Proposition to Increase the Revenue of the Stamp-Office," Redington, *Calendar of Treasury Papers*, 1708–1714, p. 235.) The duty eventually imposed (1712) was a halfpenny on papers of half a sheet or less, and a penny on such as ranged from half a sheet to a single sheet (10 Anne, c. xix. § 101).

Swift's doubt expressed in his *Journal to Stella* (Aug. 7, 1712) as to the ability of the *Spectator* to hold out against the tax was justified by its discontinuance in Dec. 1712, Steele starting the *Guardian* in 1713, which only ran for six months. But some of the worst journals that were already in existence kept their ground, and the number of such ere long increased. An enumeration of the

London papers of 1714 comprises the *Daily Courant*, the *Examiner*, the *British Merchant*, the *Lover*, the *Patriot*, the *Monitor*, the *Flying Post*, the *Postboy*, *Mercator*, the *Weekly Pacquet* and *Dunton's Ghost*. Another enumeration in 1733 includes the *Daily Courant*, the *Craftsman*, *Fog's Journal*, *Mist's Journal*, the *London Journal*, the *Free Briton*, the *Grub Street Journal*, the *Weekly Register*, the *Universal Spectator*, the *Auditor*, the *Weekly Miscellany*, the *London Crier*, *Read's Journal*, *Oedipus or the Postman Remounted*, the *St. James's Post*, the *London Evening Post* and the *London Daily Post*, which afterwards became better known as the *Public Advertiser*. Part of this increase may fairly be ascribed to political corruption. Later towards the middle of the same century the provisions and the penalties of the Stamp Act were made more stringent. Yet the number of newspapers continued to rise. In 1753 the aggregate number of copies of newspapers annually sold in England, on an average of three years, amounted to 7,411,757. In 1760 it had risen to 9,464,790, and in 1767 to 11,300,980. In 1776 the number of newspapers published in London alone had increased to fifty-three.

18th Century Journalists.—Thus the 18th century saw the gradual development of the purely political journal side by side with those papers which were primarily devoted to news, domestic and foreign, and commerce. It was left to Steele and Addison (*q.v.*) to develop the social side of journalism in their journals named above which have found a permanent place in English literature. Nor must we omit Dr. Johnson's 2d. bi-weekly, the *Rambler*, started in 1750, and his weekly, the *Idler* (1758). In 1761 the *North Briton* came out and it was largely due to Wilkes' determined fight for the liberty of the press (see WILKES, JOHN) that at length the last shackles on free expression of opinion in Britain were cut away, and by 1772 the right to publish parliamentary reports had been established.

The outstanding daily paper in the middle of the 18th century was the *Public Advertiser*, which for some 25 years had been called the *General Advertiser* (and for some time the *London Daily Post*). It was published with notable success by Henry Woodfall and his son Henry Samson Woodfall, and it was in this paper that appeared the famous Letters of Junius (*q.v.*), which have been attributed to Philip Francis. These papers led to a marked increase in its circulation, the monthly sale in Dec. 1771 being close on 84,000 as compared with 47,500 seven years previously. But in 1798 it was merged in the *Public Ledger*.

Early 19th Century.—In 1769 William Woodfall started the *Morning Chronicle*, whose daily circulation in 1819 reached 4,000, and in 1843, at a time when Dickens was a contributor, 6,000. But in another six years the circulation had fallen to 3,000. For some five years it became the property of the duke of Newcastle, Mr. Gladstone, and others, but finally ended insolvent, after a life of over ninety years. Another longlived daily paper, whose top circulation was about 6,000, was the *Morning Herald* (1781–1869). Two other important dailies were started in the 18th century which still exist, the *Morning Post* and *The Times*; these are dealt with later, together with the *Morning Advertiser*, founded in 1794. It was William Cobbett (*q.v.*) who first attempted to reach the masses by his pen, and reduced the price of his *Weekly Political Register* from 1s.-0½d. to twopence in his endeavour to appeal to the working classes for support of those principles of parliamentary reform dear to his heart. In 1808 Leigh Hunt brought out the *Examiner* whose frank criticism of the prince regent landed him and a brother in gaol. This weekly journal had quite a long lease of life and excelled in dramatic criticism, besides giving an excellent review of the events of the week in all branches of public affairs.

Abolition of Taxes on Knowledge.—The development of the press was enormously assisted by the gradual abolition of the "taxes on knowledge," and also by the introduction of a cheap postal system. In 1756 an additional halfpenny was added to the tax of 1712. In 1765 and in 1773 various restrictive regulations were imposed. In 1789 the three-halfpence was increased to twopence, in 1798 to twopence-halfpenny, in 1804 to threepence-halfpenny, and in 1815 to fourpence, less a discount of 20%. As prosecutions multiplied, and the penalties became more serious,

revolutionary tendencies increased in a still greater ratio. Blasphemy was added to sedition. Penny and halfpenny journals were established which dealt exclusively with narratives of gross vice and crime. Between 1831 and 1835 hundreds of unstamped newspapers made their appearance. The political tone of most of them was fiercely revolutionary. Prosecution followed prosecution; but all failed to suppress the obnoxious publications.

To Bulwer Lytton, the novelist and politician (Lord Lytton, *q.v.*), and subsequently to Milner Gibson and Richard Cobden, is chiefly due the credit of grappling with this question in the House of Commons in a manner which secured first the reduction of the tax to a penny in 1836, and then its total abolition in 1855. The number of newspapers established from the early part of 1855, when the repeal of the duty had become a certainty, and continuing in existence at the beginning of 1857, amounted to 107; 26 were metropolitan and 81 provincial. The duties on paper itself were finally abolished in 1861.

The abolition of the stamp taxes brought about such reductions in the prices of newspapers that they speedily began to reach the many instead of the few. Some idea of the extent of the tax on knowledge imposed in the early 19th century may be gathered from the fact that the number of stamps issued in 1820 was close on 29,400,000, and the incidence of the advertisement tax, fixed at 3s. 6d. in 1804, made it impossible for the newspaper owner to pass on the stamp tax to the advertiser, as is done nowadays with regard to all commodities of popular consumption. In 1828 the proprietors of *The Times* had to pay the State over £68,000 in stamp and advertisement taxes and paper duty. But after the reduction of the stamp tax in 1836 from 4d. to 1d. the circulation of English newspapers, based on the stamp returns, rose from 39,000,000 to 122,000,000 in 1854.

Lord Northcliffe, or Alfred Harmsworth as he then was, was the pioneer of the half-penny daily newspaper towards the end of the century. He wrote an article for the 11th edition of the *Encyclopædia Britannica*, in which after sketching the development of the British press he pointed out that "the development—and indeed the possibility—of the cheap daily paper was due to a number of causes operating together during the latter half of the 19th century. Among these, the first place must undoubtedly be given to the cheapening of paper, through the introduction of wood pulp and the perfecting of the machinery used in the manufacture. From 1875 to 1885 paper cheapened rapidly, and it has been estimated that the introduction of wood pulp trebled the circulation of newspapers in England. Keen competition in the paper trade also did much to lower prices. At the same time the prime cost of newspaper production was increased by the introduction of improved machinery into the printing office. The growth of advertisements must also be taken into account in considering the evolution of the halfpenny journal. The income from this source alone made it possible to embark upon journalistic enterprises which would otherwise have been simply to court disaster. The popular journal of the present day does not, however, owe its existence and success merely to questions of diminished cost and improved methods of production. A change has come over the public mind. The modern reader likes his news in a brief, handy form, so that he can see at a glance the main facts without the task of reading through wordy articles. This is especially the case with the man of business, who desires to master the news of the past 24 hours as he travels to his office in the morning. It is to economize time rather than money that the modern reader would often prefer a halfpenny paper; while the man of leisure, who likes to peruse leading articles and full descriptive accounts, finds what he needs in the more highly priced journals. The halfpenny paper in England has not had to contend with the opposition that the penny newspaper met from its threepenny contemporaries in the 'fifties and 'sixties. This is largely due to the fact that in most cases the contributors, paper, printing and general arrangement of the cheaper journal do not leave much room for criticism. G. A. Sala once complained that the reporters of the older papers objected to work side by side with him when he represented the first penny London daily (the *Daily Telegraph*), through fear of losing caste, but this does not now

apply, for in the United Kingdom, France and the United States the cheap journals, owing to their vast circulation, are able to offer the best rates of remuneration, and can thus command the services of some of the best men in all the various departments of journalism."

Newspaper Expansion.—The history of journalism in the 17th century has been divided by a well-known writer on the press, H. R. Fox Bourne, roughly into four stages: (1) persecution; (2) liberation, 1830–1855; (3) cheapening, 1855–1875; (4) widening, since 1875. The first three stages have already been outlined, but the widening process, which has gone on ever since, must be traced to the wonderful progress in the technique of newspaper production and the vast increase in the reading public resulting from the development in State education. Perhaps the most notable event at the beginning of the cheapening stage was the foundation of the *Daily Telegraph and Courier* in June 1855 at 2d., which was reduced to 1d. in ten weeks, with the result that in six months it had the then remarkable circulation of 27,000 a day. Julius Reuter founded in Paris in 1849 the great foreign news agency which still bears his name though it is now controlled by the Press Association, an organization for the gathering and dissemination of domestic news which was founded in 1865. This was preceded in 1863 by the Central Press and followed in 1870 by the Central News and next the Exchange Telegraph with their ticker machines.

It is appropriate at this stage to sketch the history of the great English newspapers.

THE LONDON PRESS

The Times, which occupies the premier position among English newspapers, was started by John Walter on Jan. 1, 1785 under the name of the *Daily Universal Register*. Then, as now, it was printed in Printing House square, Blackfriars. The founder promised the readers of the new journal that it would contain nothing to wound anyone's delicacy or corrupt the mind, that it would abstain from unfair partisanship and scandalous scurrility, and that it would be a faithful recorder of legitimate intelligence. On Jan. 1, 1788 its title was changed to *The Times*, and this great newspaper has ever since been the pre-eminent national journal and daily historical record. It came into existence when a new wave of democratic thought was spreading over Europe, and the French revolution was already brewing. Free expression of opinion in the press was still a thing of the future, and within a few years of the establishment of his paper Walter had several sojourns in Newgate and had to pay several fines for criticisms of the authorities. One of his offences was the statement that the then prince of Wales and other royal princes had by their misconduct incurred the just disapprobation of George III.

John Walter the second practically took over the reins in 1803, and he also had to encounter the active opposition of governments whom he had occasion to criticise, including that of William Pitt. He introduced a better system of news transmission and steam printing (1814) with the result that he was able to make the proud announcement that 1,100 sheets had been impressed in one hour. In view of the newspaper and advertisement tax and other disabilities, it was a considerable achievement when in 1815, the year of Waterloo, the daily circulation reached 5,000. In twenty years this was doubled, in 1835 it had reached 40,000, and three years later it was over 50,000, when its most circumscribed rival, the *Morning Advertiser*, had a sale of less than 8,000 copies. When John Walter the second assumed control *The Times* was a small four-page sheet. When he gave up control in 1847 it consisted of twelve large pages. Sir John Stoddart, later governor of Malta, was the editor for several years up to 1816. He was succeeded by Thomas Barnes, and when the latter's health began to fail much of the editorial work devolved upon Captain Edward Sterling, whose pontifical and sometimes explosive style caused Carlyle to say: "he more than any other man was *The Times*, and thundered through it to the shaking of the spheres." Carlyle also called him "Captain Whirlwind," and the popular title of "the Thunderer" often given to *The Times* dated from his time. In those days the most powerful writer in its columns on foreign

affairs was Crabb Robinson; his place was taken at a later date by Henry Reeve.

In 1841 on the death of Barnes the editorial chair was taken by quite a young man, John Thaddeus Delane, whose brilliant career in this capacity lasted until 1877. His place was taken by Dr. Thomas Chenery, who died in 1884 and was succeeded by George Earle Buckle, who since his retirement in 1912 has won a niche in English literature by his life of Disraeli. Meanwhile since 1848 John Walter the third had been in command. He died in 1894, and was succeeded by Arthur Walter.

About the beginning of the 20th century *The Times* had begun to feel the influence of the more go-ahead methods of the popular press, and there was a loss of circulation and revenue which became a grave source of anxiety to its owners. It was a period when another great London daily paper, the *Standard*, was in extremis. Finally in 1908 Lord Northcliffe realised his ambition of long years and acquired the chief control of the "Thunderer," with A. Walter as chairman of the company which was created to carry it on, and Moberly Bell as managing director. It cannot be said that Lord Northcliffe's administration was consistently successful but he thoroughly remodelled the organisation and increased its efficiency in all departments. There is no doubt that by the introduction of sound business methods he laid a solid foundation upon which the present remarkable prosperity of the paper is largely based. Under his rule the price of *The Times* at different periods was threepence, twopence, and a penny. At earlier dates the price had been: 1796, 4½d.; 1799, 6d.; 1809, 6½d.; 1815, 7d.; 1836, 5d.; 1855, 4d.; and 1861 (on the abolition of the newspaper tax) 3d., at which it remained right up to the end of the 19th century. It is now (1929) 2d. On his retirement Buckle was succeeded as editor by Geoffrey Dawson, then a young man, formerly private secretary of Lord Milner and editor of the *Johannesburg Star*. During the World War he retired from the editorship owing to a difference of opinion with Lord Northcliffe and his place was taken by Wickham Steed. When after the war and the death of Lord Northcliffe, Major J. J. Astor, M.P., became its chairman and chief proprietor, Geoffrey Dawson again became editor. Major Astor secured the future independence of the paper by a deed establishing a body of trustees consisting of holders of various public offices whose consent would be required to validate any future transfer of ownership.

The Times excels in every department, mainly by employing experts in particular subjects. It is the only newspaper whose law reports are recognised by the courts as authentic, these reports being done day by day by skilled barrister reporters. Similarly *The Times* specialises in its presentation of foreign affairs and has maintained for nearly a century in the chief capitals of the world an able staff of foreign correspondents, of whom one of the most famous was de Blowitz, who among his many "scoops," secured for *The Times* the privilege of being able to publish exclusively the text of the Berlin Treaty of 1878 on the very day that it was signed.

The principal adjuncts to *The Times* are the literary supplement, which surveys the whole field of new literature every Thursday, the weekly edition, first published in 1877, containing a summary of the week's news, *The Times* law reports (mentioned above), the educational supplement and the trade and engineering supplement, which are weekly publications, and the index, an invaluable record of the events of the day recorded in the newspaper, which is published quarterly. In addition *The Times* issues at intervals handsome supplements to its readers without any extra charge.

The publishing department of *The Times* has invaded several new fields of enterprise. *The Times Atlas* was first published in 1895, and this publication was supplemented by that of *The Times* (previously Longmans') *Gazetteer*. A much larger and more important venture was the issue in 1898 of a reprint of the ninth edition of the *Encyclopædia Britannica* at less than half the original price, on a new system of terms (known as *The Times* system) that enabled the purchaser to receive the whole work at once and to pay for it by a series of equal monthly payments. This was followed by a similar sale of the *Century Dictionary* and of a reprint of the first 50 years of *Punch*; and 11 new vol-

umes of the *Encyclopædia Britannica*, supplementing the ninth edition, and forming with it the tenth edition, were issued by *The Times* in 1902 on similar terms (see *ENCYCLOPEDIA*). There was also *The Times History of the War in South Africa* of 1899-1902.

The Daily Telegraph, another great national daily, first published as the *Daily Telegraph and Courier*, was published on June 29, 1855, as a twopenny newspaper. It was owned by Colonel Sleigh who transferred the ownership to Joseph Moses Levy in the following September. Levy produced it as the first penny newspaper in London, the name *Courier* being subsequently dropped. His son Edward Lawson (later the first Baron Burnham, soon became editor, which post he continued to hold till 1885. A long list of distinguished members of the staff included Sir Edwin Arnold, George Augustus Sala, for many years the uncrowned king of Fleet St., Professor E. Dicey, Sir J. M. Le Sage, Bennet Burleigh, the war correspondent, J. L. Garvin, and H. D. Traill; and among dramatic and literary critics Clement Scott and W. L. Courtney. After 1890 the Hon. Harry Lawson, the eldest son of the owner (now Viscount Burnham), assisted in the general control. The *Daily Telegraph* became the especial organ of the middle classes and shortly before the advent of the halfpenny daily newspaper had achieved so remarkable a success that it could claim the largest circulation in the world. It was consistently Liberal up to 1878 when it opposed Gladstone's foreign policy, and at the Irish Home Rule split in 1886 it became Unionist. Its enterprises included the financing of an important archaeological exploration in Nineveh resulting in the discovery of a number of fragments of the cuneiform narrative of the deluge, and the despatch, in co-operation with the *New York Herald*, of Sir H. M. Stanley, on a successful exploration into darkest Africa. The *Daily Telegraph* successfully weathered the World War, increasing its price to 2d. at which it (1929) remains. On the death of Sir J. Le Sage a few years ago he was succeeded in the editorial chair by J. Miller, who died after a short tenure, his place being taken by A. E. Watson, the present (1929) editor. In December 1927 Lord Burnham and his family sold the *Daily Telegraph* to Sir William and Sir Gomer Berry and Sir Edward Iliffe under whose control it has continued its same policy.

The Morning Post is the oldest of London daily newspapers extant. It was founded in 1772 as the *Morning Post and Daily Advertising Pamphlet*, a paper of eight pages, 12 inches long by 8. It was mostly an advertising sheet including State lotteries, which were legal and popular at that time. It developed into a national newspaper under the ownership of Peter and Daniel Stuart after 1795, and attracted a wonderful galaxy of writers, including Sir James Mackintosh, Samuel Taylor Coleridge, Southey, Arthur Young, the poet Moore, Wordsworth, and Charles Lamb. It has always maintained a tradition of vigorous and unblenching criticism, and Nicholas Byrne, the editor-owner who succeeded Daniel Stuart, was murdered in his office as the result of an article which had given offence. At the beginning of the 19th century the circulation was about 4,000 a day. In 1850 the paper came under the control of Peter Borthwick, who had sat for a long period as M.P. for Evesham, and on his death in 1852 he was succeeded by his son, Algernon, who had been a brilliant Paris correspondent for the *Morning Post*. Under his régime the paper settled down to a prolonged prosperity as a Conservative journal and before long became the leading society paper, whose fashionable characteristics often made it the butt of Thackeray's satirical pen. During Lord Palmerston's tenure of the Foreign Office the *Morning Post* was always regarded as his especial organ, and even in those early days it was distinguished for its robust imperialism in foreign affairs. In 1877 Borthwick became sole owner, and four years later he reduced the price from 3d. to 1d. at which it stood till the World War, when the price was raised to 2d. Borthwick became a knight, then a baronet, and was raised to the peerage as Lord Glenesk in 1895. When Lord Glenesk died in 1908 the ownership passed to his only surviving child, Countess Bathurst, who carried on the traditions of the paper (which was consistently Protectionist) until she disposed of it in 1923 to a group headed by the duke of Northumberland. Among the editors of the *Morning Post* have been Sir William Hardman, J. Nicol

Dunn, Sir Fabian Ware, and H. A. Gwynne, the present (1929) editor. The price of the paper was reduced to 1d. in 1927.

The Daily News & Westminster Gazette (the *Daily News* absorbed the *Westminster Gazette* in Feb. 1928) is the oldest Liberal newspaper published in London. It was founded in 1846 under the editorship of Charles Dickens who retired after a few weeks, being succeeded for a year or so by John Forster, later his biographer. The original staff included Mark Lemon, afterwards editor of *Punch*, and Douglas Jerrold. The *Daily News* has a consistent record as the champion of Liberalism; it led British public opinion in sympathizing with the North in the American Civil War, in supporting the war of freedom in Italy, and the emancipation of Bulgaria and the Armenians. The price of the paper was reduced to 1d. in 1868. Under the control of Sir John Robinson it attained a high reputation for its foreign correspondence, beginning with the celebrated Archibald Forbes in the Franco-German war 1870.

On a change in ownership after the retirement of Sir John Robinson, Sir E. T. Cook, who had been editor of the *Westminster Gazette*, became editor of the *Daily News* from 1896. He resigned in 1901 in consequence of another change in ownership. Cook was a Liberal Imperialist and the paper had passed under the control of D. Lloyd George and his friends; and afterwards passed under that of the Cadbury family. After an interregnum A. G. Gardiner was the next editor. In 1904 the price of the paper was reduced to a halfpenny. Gardiner resigned the editorship after the World War and was succeeded by Stuart Hodgson as editor; Tom Clarke joined the paper in 1926 as managing editor. The *Daily News* absorbed the *Morning Leader* and acquired the *Star* in 1909, and has maintained that journal as a lively and independent exponent of Liberalism. The *Daily News* is the only penny London paper which makes a daily feature of literature. It is printed in Manchester as well as in London.

The Daily Chronicle, unlike the *Daily News* which was started under distinguished auspices, was the outgrowth of a London local daily, the *Clerkenwell News*, and was established in 1877. It consisted almost entirely of small advertisements and Edward Lloyd, the founder of *Lloyd's Weekly News* turned it into a general morning London newspaper. During the Home Rule controversies of the '80s it was Liberal Unionist, but under the editorship of A. E. Fletcher (1895) it became Gladstonian Liberal. Fletcher was an idealist who sympathized with Labour and had a passion for literature. During his editorship literature was developed in the newspaper as a regular feature. Fletcher was succeeded by H. W. Massingham who, while maintaining the literary features, made the paper a more robust political organ. Massingham was a Radical; and had formerly been editor of the *Star*. He lost his position on the *Chronicle* because of his opposition to the Boer War. He was succeeded by W. J. Fisher and the paper pursued a humdrum career and was a declining property when in 1904 Robert Donald was appointed editor, with the object of revitalising the paper. The price was reduced to halfpenny and at once the paper entered upon a new era of prosperity and prestige which reached its height during the World War. During the long Liberal régime from 1906 to the year of 1915, the *Chronicle* was regarded as the chief supporter of the Left Wing of the Government. The *Chronicle* was a pioneer in the introduction of illustrations by leading artists, those contributing to the *Chronicle* including Burne Jones, Joseph Pennell, who was art editor, and Linley Sambourne. It made a high reputation for its foreign correspondence, and took a leading part in exposing public abuses.

The paper was sold to D. Lloyd George and his friends in the autumn of 1918, when Sir Robert Donald retired from his position as editor and as managing director of the company. It has since been edited by Ernest A. Perris, who joined it as news editor in 1904. In 1927 it was sold to two Indian merchants, Sir David Yule and Sir Thomas Catto, Lloyd George retaining a minority interest. Lord Reading was appointed chairman. The chairman has changed six times in ten years. Sir David Yule died in July 1928, and William Harrison, who (1929) is chairman, on behalf of the Inveresk Paper Company, Limited, acquired a

controlling interest in the paper and its associated journals. The *Daily Chronicle* is published simultaneously in London and Leeds.

The *Daily Mail* started by Alfred and Harold Harmsworth in 1896 as a halfpenny daily newspaper is one of the miracles of journalism. It was a phenomenal success from the first number. At the dawn of the present century it had already reached the million mark, and it has never looked back. In 1904 Sir Alfred Harmsworth (by that time a baronet) started the *Continental Daily Mail* in Paris, now the property of Lord Rothermere. The *Daily Mail* publishes an edition in Manchester and an Atlantic edition on the chief transatlantic steamships.

From the first the *Daily Mail* broke away from the traditional conception that a daily newspaper should espouse or reflect a particular political policy. The *Daily Mail* has been sternly independent and sometimes embarrassing to Governments and politicians but it generally registered the majority public opinion. Lord Northcliffe (as he became later) was not only a brilliant organiser but a keen journalist imbuing by personal contact all members of the able staff which he gathered around him with some of his own dynamic enthusiasm. The *Daily Mail* has been the pioneer in many enterprises in journalism and in national interests, including the invaluable help which it gave to aviation. Lord Northcliffe and his associates also deserve credit for offering inducements hitherto unequalled for special correspondents. It has brought into the profession men and women of high literary standing and has led to an increase in professional remuneration of journalists of all classes.

For many years the editor-in-chief was Thomas Marlowe, who retired two or three years after the death of Lord Northcliffe, and was succeeded by W. G. Fish.

Since it came under the control of Lord Rothermere on the death of his brother its phenomenal success has continued both in regard to increase in sales and in profit making. The annual profit of the *Daily Mail* alone is understood to exceed £1,000,000. Its daily net sale in 1928 reached 2,000,000.

The *Daily Express*, which was founded as a half-penny newspaper in 1900 by the late Sir C. Arthur Pearson, is second only to the *Daily Mail* in circulation. In its first issue it published a message of good will from the Kaiser William, and announced: "Our policy is patriotism, our party is the British empire."

It struck a new note, since imitated by other papers, of publishing its principal news on the first page, which became, so to speak, the shop-window. In 1902 R. D. Blumenfeld joined the staff; he became editor in 1904, and in 1912, when Sir Arthur Pearson lost his sight, formed a syndicate which acquired control. Lord Beaverbrook began to take an interest in the paper while it was financially in low water and during the war obtained complete control. Blumenfeld remained the managing editor. Immediately after the War the *Daily Express* showed increased vitality. Lord Beaverbrook spent prodigious sums out of revenue in developing the paper. To a large extent it is his personal organ—and expresses his views on political and other affairs.

The *Daily Express* is printed simultaneously in London, Manchester and Glasgow.

The *Daily Herald* (price 1d.), the official organ of the Trades Union Congress, after passing through severe financial difficulties has now definitely taken its place among London dailies. It occupies a unique position in the press as the only daily newspaper exclusively devoted to the interests of the Labour party. It is more of a political organ than a general newspaper, and is financed mainly by trade unions.

A notable addition to Labour journalism took place in April, 1929, when the Co-operative Societies affiliated with Labour acquired *Reynolds' Newspaper*, which was established over 80 years ago and has been consistently conducted on democratic lines.

Other Dailies.—There is only one sporting daily newspaper in London, the *Sporting Life* (started in 1859) with which was amalgamated after the World War the *Sportsman* (founded 1865). The famous old sporting newspaper *Bell's Life* was absorbed by the *Sporting Life* in 1886. Finance is represented by the *Financial News* (founded in 1884) and the *Financial Times* (1888) which absorbed the *Financier*, now each 2d.

London Evening Newspapers.—There are only three London evening newspapers surviving, each published at 1d. The oldest of these is the *Evening Standard*, first published as an evening edition of the *Standard*, which was founded in 1827. It has absorbed in turn the *St. James's Gazette*, the *Globe* and the *Pall Mall Gazette*. It is now the property of the Beaverbrook group.

The *Evening News* was founded in 1881, and after many vicissitudes of fortune when in low water was acquired in 1895 by Alfred and Harold Harmsworth and Kennedy Jones. It was the Harmsworths' first incursion into daily journalism, and made a rich experimental field for the *Daily Mail*. The *Evening News* is one of the Associated Newspaper group and has the largest circulation of any of the evening papers in the country.

The *Star*, the only Liberal evening paper in London, was started by T. P. O'Connor in 1888 as a halfpenny journal in support of Gladstone. In 1909 it was acquired by the *Daily News*.

Great Papers of the Past.—Fleet street is crowded with the ghosts of journals which in their time have filled important places in the life of the country. There was the *Morning Chronicle* which began its career in the 18th century and had among its contributors Sheridan, Sir J. Mackintosh, John Campbell (afterwards Lord Chancellor), Campbell, the poet, Thomas Moore, Lord Brougham, Byron, William Hazlitt, John Stuart Mill, Charles Lamb and Thackeray. John Black, its most famous editor used to say that one of the paper's parliamentary reporters, Charles Dickens, was the best shorthand writer he had ever known. After a notable career the *Morning Chronicle* died in 1862.

The *Standard* was established as an evening paper in the Tory interest (as the express organ of the opponents of the measure for removing Roman Catholic disabilities) in 1827, its first editor being Stanley Lees Giffard, father of the first earl of Halsbury. In the '50s it was purchased by James Johnstone, who brought out the *Standard* as a morning paper (June 29, 1857), increased its size from four to eight pages, and reduced the price from fourpence to twopence. In Feb. 1858 Johnstone again reduced the price, this time to a penny. One of its contributors in the 'sixties was Lord Robert Cecil, later Lord Salisbury, the prime minister. In the early '60s it engaged William Heseltine Mudford. He was sent as special correspondent to Jamaica in 1865 to report upon the troubles which involved the recall of Governor Eyre; a further period in the gallery of the House of Commons followed, and in 1876 Mudford became editor. Johnstone, the proprietor to whose energy and perspicacity the paper owed so much, died in 1878, and under his will Mudford was appointed editor and manager for life, or until resignation. Already a great property, the *Standard* in Mudford's hands entered upon a very successful period. Alfred Austin, T. H. S. Escott, Miss Frances Power Cobbe and Professor Palmer were all writing for the paper at the same time. It had many famous war correspondents, foremost among whom were G. A. Henty, the famous author of boys' books; John A. Cameron, who was killed at Abu Klea; and William Maxwell. In January 1900 Mudford retired, and was succeeded in the editorship by G. Byron Curtis (d. 1907). In November 1904 the *Standard*, which had at that time taken rather a strong line in deprecating the tariff reform movement within the Unionist party, was sold to (Sir) C. Arthur Pearson, who was chairman of the Tariff Reform League, and H. A. Gwynne became editor. In 1910 it passed into the control of Davison Dalziel (the late Lord Dalziel) and disappeared during the war.

A disastrous experiment in newspaper production was the *Tribune*, founded by Franklin Thomasson in 1906 as a solid penny daily. After gathering a brilliant staff and expending very large sums he found it necessary to discontinue the paper in 1908. The unhappy enterprise is described in Sir Philip Gibbs' novel "The Street of Adventure." The *Echo* was established by Cassells in 1868 and afterwards owned in turn by Albert Grant, the company promoter, Passmore Edwards, Andrew Carnegie, and the late Sam Storey. The *Echo* perished in 1905.

The *Globe* was founded in 1803, and after many years as a leading Whig organ it turned Conservative in 1866 when it became the property of a syndicate which included Sir Stafford Northcote

(Lord Iddesleigh). Two years later it assumed the deep pink hue which it kept until its demise after the World War. The first number of the *Pall Mall Gazette* (the name being borrowed from the incident in which Thackeray describes Captain Shandon in the Marshalsea prison drafting the prospectus of the *Pall Mall Gazette* as a paper "written by gentlemen for gentlemen") appeared in February 1865. Its first editor was Frederick Greenwood, who gathered round him a brilliant array of talent in Sir Henry Maine, Sir J. Fitzjames Stephen, Anthony Trollope, Charles Reade, George Henry Lewes, George Eliot, Matthew Arnold, and Richard Jefferies. In 1875 Greenwood was able to convey to Disraeli news of the French bid to secure control of the Suez Canal, thereby enabling Britain to get in first. It had been a consistent supporter of Disraeli, and when on changing hands it became Liberal John Morley became editor, with W. T. Stead as assistant editor. In 1882 its price was reduced from 2d. to 1d.

When Morley exchanged journalism for politics in 1883, he was succeeded by W. T. Stead (*q.v.*), with Alfred Milner, afterwards Lord Milner, as his assistant. Stead's adventurous career as the editor came to an end in 1889, in consequence of his publishing a series of articles called "The Maiden Tribute of Modern Babylon," purporting to further the Criminal Law Amendment Bill. He was succeeded by E. T. Cook. The *Pall Mall Gazette* was now steadily Liberal and a strong advocate of Irish Home Rule. It had two distinguished editors at a later date in Sir Douglas Straight and J. L. Garvin, and finally passed through several hands before its decease.

Founded in 1880 by H. Hucks Gibbs (afterwards Lord Aldenham), for Frederick Greenwood to edit when he had left the *Pall Mall*, the *St. James's Gazette* represented the more intellectual and literary side of Tory journalism in opposition to the new Liberalism of Mr. Greenwood's former organ. In 1888 the paper having then been sold, Greenwood retired and was succeeded as editor (1888-1897) by (Sir) Sidney Low, who in his turn was succeeded by Hugh Chisholm (1897-1900). Among the contributors were Rudyard Kipling, Sir James Barrie and G. S. Street.

Towards the end of the 19th century it assumed a more popular style and shape, and for a year or two before its acquisition by (Sir) C. Arthur Pearson in 1903 and its final merging in the *Evening Standard* it was edited by Ronald MacNeill (Lord Cushendun).

When the *Pall Mall Gazette* was sold to Lord Astor in 1892 and converted into a Conservative organ, E. T. Cook, the editor, and most of his staff resigned; in 1893 they came together again on the *Westminster Gazette*, newly started for the purpose by Sir G. Newnes (who had made a fortune out of *Tit-bits* and other popular papers) as a penny Liberal evening paper. It was printed on green paper. The paper was conducted on the lines of the old *Pall Mall*, and it had the advantage of a brilliant political cartoonist in F. Carruthers Gould. In 1895 Cook was appointed editor of the *Daily News*, and his place was ably filled by J. Alfred Spender, who had been his assistant-editor, F. C. Gould (who was knighted in 1906) being his chief assistant. Apart from Sir F. C. Gould's cartoons, the *Westminster* became conspicuous in London evening journalism for its high standard of judicious political and literary criticism. It gradually became the chief organ of Liberal thought in London. In 1908 a change of proprietorship took place, the paper being sold by Sir G. Newnes (d. 1910) to a group of Liberal capitalists including the late Lord Cowdray and Lord Melchett (then Mr. A. Mond), but without affecting the *personnel* or policy of the paper. How the famous green *Westminster* finally vanished after the war to be replaced by the daily newspaper of the same name, which was merged in the *Daily News* in 1928, has already been stated.

BRITISH PROVINCIAL PRESS

The first provincial paper in England was the weekly *Worcester Postman* started in 1690, now *Berrow's Worcester Journal*. Next in 1695 was born the *Lincoln, Rutland and Stamford Mercury*, now known by the last two names only, and in the first 20 years of the 18th century a number of other journals sprang up in country towns, practically all weekly papers. At the beginning

of the 19th century the provincial press consisted of less than a hundred journals, as compared with many thousands at the present day. They were at that time practically without influence and presented a minimum of local news without expressing any views. Benjamin Flower, printer of the *Cambridge Intelligencer*, who in 1799 was haled before the House of Lords for breach of privilege in commenting upon some action by a bishop, fined £100 and sent to Newgate for six months, was the first to introduce the leading article in the provincial press. The *Leeds Mercury*, founded in 1717, under the control of Edward Baines (1801) became the most important and influential of the north country papers in the first half of the 19th century. For many years it admitted neither theatrical nor racing matter to its columns until the sentiment of its readers in Lancashire and Yorkshire underwent a change in regard to these forms of amusement. After the Reform Act of 1830 and the contemporaneous spread of self-education and establishment of reading circles and newspaper clubs, the country newspapers developed in importance and usefulness, being forced to assuage the public thirst for information and instruction. It was not however till the final removal of the taxes on knowledge, already described, that the provincial press came into its own, and from being strictly local organs began to show almost as large an interest in affairs of national importance as their London contemporaries.

Within ten years of the abolition of the paper duty penny morning newspapers had taken up commanding positions in Edinburgh, Glasgow, Dundee and Aberdeen; in Liverpool, Manchester, Leeds, Bradford, Newcastle and Sheffield; in Birmingham and Nottingham; in Bristol, Cardiff and Plymouth; and across St. George's Channel in Dublin, Cork, Belfast and Waterford. But any real importance as organs of opinion was still confined to only a few of the great penny provincial dailies, notably the *Yorkshire Post*, *Manchester Guardian*, *Birmingham Post* (1857), *Sheffield Telegraph* (associated with Sir W. Leng), *Liverpool Daily Post*, *Leeds Mercury* and *Western Morning News*; others too numerous to mention here were at the same time cradling journalists who were to become famous in a larger sphere, such as the *Darlington Northern Echo*, on which W. T. Stead made his debut, while Joseph Cowen for some years made the *Newcastle Daily Chronicle* a powerful force.

In the early 'seventies such a thing as a full telegraphic report in a provincial morning newspaper of parliamentary proceedings, or of a speech by a leading statesman, was almost unheard of. The Press Association had not then covered the country with its organization. Reuter's foreign news service very briefly reported important events. Between 1870 and 1880 a complete revolution was effected, as the result of social and educational changes. Newspapers that had been content to fill their columns with local news and clippings from London and distant provincial papers put such matter aside. Telegraphic news crushed it out. When in Feb. 1870 the government took over the telegraph system, and gave special terms for press messages, English and Irish newspapers, following Scotland's lead, began to open offices in London with special wires. The Press Association spread its news-collecting organization over the whole country, and was stimulated to activity by the rising opposition of the Central News. The universal use of news agency messages tended to a uniformity from which the more enterprising journals saved themselves by special London letters, parliamentary sketches and other exclusive contributions. In 1881 the reporters' gallery in the House of Commons was opened to some provincial newspapers. The first syndicate to send out war correspondents was formed by the *Glasgow News*, the *Liverpool Daily Post*, *Manchester Courier*, *Birmingham Gazette* and *Western Morning News*, who despatched two correspondents to Egypt. The Central News also sent out war correspondents to Egypt and the Sudan. During the South African War (1899-1902) the leading provincial newspapers, however, all formed syndicates amongst themselves to secure war telegrams, and in many cases made arrangements for the simultaneous publication of the letters and telegrams of leading London journalists.

Leading Provincial Newspapers.—The leading English provincial daily papers in 1929 were:

The *Manchester Guardian*, price 2d., founded in 1821 as a weekly Whig organ and for the last fifty years the chief exponent of Liberalism outside London. During this latter period it has been edited by C. P. Scott, and has maintained a standard of excellence in all its branches that has given it a world-wide reputation. Apart from its vigorous politics it enjoys an unrivalled literary prestige, and a dignity of expression and presentation, unsullied by recourse to the methods of self-advertisement which seem necessary to those more popular newspapers that seek huge circulations. It became a penny paper in 1857, two years after it had been turned into a daily journal. Prominent names associated with it have been C. E. Montague (who died in 1928), C. P. Scott's son-in-law, L. T. Hobhouse, Andrew Lang, Richard Jefferies, Richard Whiteing (who died in June 1928), Sir Claude Phillips, George Saintsbury, Laurence Housman, G. W. E. Russell, and Spenser Wilkinson. In its book reviewing, its dramatic criticism, and its foreign correspondence alone the *Manchester Guardian* exercises an unparalleled influence in provincial journalism, and is usually regarded as a national organ.

The *Yorkshire Post*, price 2d., started in 1866 as a Conservative paper and now ranks as the principal Conservative newspaper outside London, enjoying a national prestige extending far beyond the borders of Yorkshire. In its early years it devoted especial attention to racing, which was neglected by most local papers in the county in those days, and under the control of the Beckett family it rapidly attained a solid prosperity which it still maintains. It has had talented editors in H. J. Palmer, J. S. R. Phillips, and Arthur H. Mann (its present—1929—editor).

The *Birmingham Daily Post*, price 1d., founded in 1857 by J. F. Feeney and John Jaffray (afterwards made a baronet) and now controlled by Sir Charles Hyde, Bart. It holds a position in the midlands analogous to that of the *Yorkshire Post* in the north, and is edited by G. W. Hubbard.

The *Liverpool Daily Post and Mercury*, price 1d., founded in 1853 as a Liberal paper, and for many years possessing as its editor the outstanding personality of Sir Edward Russell. In 1904 it absorbed the *Liverpool Mercury* (founded in 1811), and it holds a pre-eminent place in the life of the great seaport.

Scotland, Wales and Ireland.—In Scotland the leading newspapers are the *Scotsman* and the *Glasgow Herald*, each 2d. The former was started as a biweekly in 1817 and became a daily in 1855. It was Liberal until the Home Rule split in 1886 when it adopted the Unionist cause. Alexander Russell was its most famous editor in the 19th century (1848–1876) and for many years it has been the only Edinburgh morning newspaper.

The *Glasgow Herald* dates from 1783, when it first came out with the extra name "and Advertiser" tacked on. It has a great literary reputation, well maintained under Sir Robert Bruce's present editorship. He follows an illustrious line of editors, including Samuel Hunter, George Outram, Dr. Russell, and Dr. Wallace. The *Glasgow Herald* has a high reputation as a commercial organ and is credited with having a larger sale than any newspaper published at 2d. outside London.

The daily newspapers of Scotland, which for the latter part of the 19th century were predominantly Liberal, are now Conservative, except the *Edinburgh Evening News*.

The chief newspaper in Wales is the *Western Mail*, Cardiff, which has recently absorbed the *South Wales Daily News*, and thus becomes the only morning paper in the Principality.

The only important newspaper town in Northern Ireland is Belfast, which has two historic newspapers: the *Belfast News Letter*, which has been in existence about 200 years, and the *Northern Whig*, which celebrated its centenary some years ago. The *Irish News* is the provincial organ of Nationalist opinion. The only evening newspaper in 1928 was the *Belfast Telegraph* (1½ d.).

SUNDAY NEWSPAPERS

The rise of the Sunday newspapers in the last twelve years is alluded to elsewhere. Here it may be noted that the historic Sunday newspapers, unlike some of the historic daily newspapers, show great vitality.

The *Observer*, which is the most powerful political organ of

the Sunday newspapers and saw the light in the year 1791, a period when France had entered upon a revolution which was to shake the foundations of Europe and change the course of history. The *Observer* reported the battle of Trafalgar, 1805, without headlines and ten years later Wellington's dispatch on the Battle of Waterloo as if it were the heading of a parliamentary Blue Book. The *Observer* kept on its respectable but somewhat sombre career until it was acquired by Lord Astor and edited by J. L. Garvin, when it assumed a distinctive character, a virile independence in its political outlook while it made a strong feature of foreign correspondence, literature, the drama, etc.

The *Sunday Times*, another historic Sunday newspaper which was founded in 1822, is parallel with the *Observer* except that it is more moderate and consistent in its political outlook, but there is not much to choose between the two newspapers in regard to their general features. The *Sunday Times* is notable in respect that it laid the foundations of the Berry family in the newspaper world. It was the first general newspaper acquired by Sir William Berry, who bought it in 1915. He has exercised a particular control over it. The editor is (1929) Leonard Rees.

Another old Sunday newspaper is *Lloyd's Weekly News*, now known as the *Sunday News*, started by Edward Lloyd in 1842. A year later the *News of the World* was founded. During the last 20 years it has become the most widely circulated of all newspapers. *Reynolds Illustrated Newspaper*, a democratic organ, was started in 1850, and the *People* (Conservative), in 1881.

The two Sunday picture papers are the *Sunday Pictorial* and the *Sunday Graphic*. The other Sunday papers vary in the degree to which they cater for the masses by sensational news, crime stories, prizes, competitions, coupons, etc. The *Sunday Dispatch* (formerly the *Weekly Dispatch*) and the *Sunday Express* are somewhat similar in type and less popular in their appeal than other journals which exceed them in sale, headed by the *News of the World*, which has a sale of nearly four millions, the *People*, the *Empire News*. Other most widely circulated Sunday papers are the *Sunday Chronicle* and the *Sunday News*. A development since the war has been provincial Sunday newspapers outside Manchester, the home of the *Sunday Chronicle* and the *Empire News*, such as the *Sunday Sun*, Newcastle, the *Sunday Post*, Glasgow, the *Sunday Mercury*, Birmingham, and the *Sunday Sentinel*, Stafford. The aggregate sale of all the Sunday newspapers is estimated to be 16,000,000.

DEVELOPMENT OF THE MODERN NEWSPAPER

It was the last quarter of the 19th century that witnessed the beginning of changes in journalism which moulded the present character of the British newspapers. The first sign of change was struck by W. T. Stead in the *Pall Mall Gazette*, over 40 years ago. He popularised the interview, and humanised political journalism. He was cramped in his activities, as he edited an afternoon review rather than a newspaper. The influence which the *Pall Mall Gazette* exercised under Frederick Greenwood, John Morley, W. T. Stead, and E. T. Cook was indirect. It had no popular appeal.

The first break in old traditions and appeal to democracy through the press came when T. P. O'Connor founded the *Star* in Jan. 1888. With the *Star* began a new type of popular journal. Human interest was its daily fare, and though small in size its scope was as wide and diversified as life. Politics and crime, special and personal news, finance and serial stories, books and fashions, labour, art, music, were all popularised by O'Connor. He had on his staff seven men who were afterwards editors of London newspapers, and the men who began their careers on the *Star* and gained fame in their own spheres in later years include George Bernard Shaw, A. B. Walkley, the greatest dramatic critic of his time, and that wayward genius Joseph Pennell.

As already mentioned the big advance in the new journalism was left to Alfred Harmsworth, the late Lord Northcliffe (*q.v.*). Newspapers were the second stage of his meteoric career. He began with *Answers* and other periodicals, following the lead of Sir George Newnes with his *Tit-Bits*, and soon surpassed him. After his success in this sphere of journalism, Lord Northcliffe

and his brother, Harold Harmsworth (now Lord Rothermere), acquired the *London Evening News*, and on this founded their phenomenal success in halfpenny morning journalism.

The 20th Century.—The introduction of half-tone pictures to illustrate the news of the day was another new element in extending the sphere of the daily press and in popularising it. Encouraged by the support which he received from women readers of the *Daily Mail* and of his many weekly variety papers, Lord Northcliffe issued a newspaper which was to be edited by women for women. He produced the *Daily Mirror*, intended to be a higher type of paper than the *Daily Mail*, and to appeal more to the interests of serious-minded women. It was still-born. It was Lord Northcliffe's greatest failure. But it was a lucky failure. The paper which was intended to be the women's *Times* was transformed into the first illustrated halfpenny daily newspaper. The *Daily Mirror* was bought by Lord Rothermere, and became as great a financial success as the *Daily Mail*.

The *Daily Sketch* was the next halfpenny daily picture paper to be published. The *Daily Graphic* had existed for many years as a penny daily illustrated paper, but never attained great success nor won popular favour. All newspapers began, one after the other, to introduce a page of half-tone pictures and to publish other pictures in their news columns, the *Times* and the *Daily Telegraph* being among the last to adopt this feature.

Meanwhile other newspapers had been compelled by the success of the *Daily Mail*, followed by the *Daily Express*, to come down to a halfpenny and similarly to make their appeal to the masses. Leading articles became shorter, feature pages were introduced, and a magazine page with short articles and items of the tit-bit character, though it must not be assumed that this abbreviated style carried with it any real degeneration of journalism.

The World War brought more changes. At first, like all other industries, except those concerned with the production of munitions or in some way associated with catering for the forces, the press was disorganized. The Government recognised that the press was an essential element in national effort, and facilities were granted to newspapers, both in regard to obtaining materials and in retaining man power. For the first time also, war correspondents became more than camp followers, were granted uniforms and became officially attached to armies.

No industry has undergone such dramatic changes since the World War as the press. The late Kennedy Jones, who was associated with the Harmsworths in founding the *Daily Mail*, said to the late Lord Morley: "You found journalism a profession, we have made it a branch of trade." It has now become also a branch of finance.

THE ERA OF AMALGAMATIONS

The great change from the private proprietorial system to limited liability companies was initiated by Lord Northcliffe in promoting limited liability companies to take over Harmsworth Bros., the most successful periodical business, and afterwards *The Evening News*. Amalgamations and groupings of papers followed. Referring to this phase of newspaper development Sir Robert Donald, in an address at York, as president of the Institute of Journalists, in 1913, said: "Combination has been the chief characteristic of industry all over the world, and the press could not remain outside this tendency. One company sometimes owns or controls a series of newspapers. There have been absorptions, amalgamations and alliances, with the result that vast aggregations of capital have been built up in which thousands of shareholders are interested. These agglomerations, piling up power and wealth, are controlled by the same forces which operate in other fields of industrial activity." He also predicted that the future would see combinations increase; there would be fewer newspapers, and "colossal circulations would continue to grow." The newspaper run as a luxury and for a mission, and not as a business enterprise, would be squeezed out of existence. There would therefore be fewer newspapers, but the total circulations would be greater.

These predictions, made a year before the World War, have been fulfilled, but no one foresaw that the press combinations

would reach such gigantic proportions, or become so immensely profitable. The war facilitated and expedited the rise of the press syndicates. One has only to look at the Stock Exchange quotations to realise the influence of finance on the Press and the power of the press in finance.

There has however been a decrease in the number of newspapers. In 1928 there were in Great Britain, Northern Ireland, and the Irish Free State, 2,150 newspapers, distributed as follows: London 992, of which 21 were morning, including specialist papers (*Jewish Express*, in Hebrew, *Jewish Times*, *Lloyd's List*, and *Lloyd's Daily Index*), and 3 evening dailies (and the *Jewish Evening News*, published in Whitechapel). The newspapers in the English provinces and Wales, including localised issues, numbered 1,363, of which 35 were morning and 80 evening dailies; Scotland, 228, including 6 morning and 10 evening dailies; Ireland, 161, including 8 morning and 5 evening dailies; the British Isles, 16, of which 5 were dailies.

Twenty years previously there were nearly 200 more newspapers than in 1928, although the population greatly increased during these two decades.

The rise of the newspaper combination has dethroned all the old newspaper dynasties. The Walters of *The Times* are no longer in control of that great national newspaper. The Borthwicks of *The Morning Post*, the Lloyds of the *Daily Chronicle* and *Lloyds News*, the Hultons of the *Manchester Daily Dispatch*, etc.; the Ingrams of the *Illustrated London News*; Cox of the *Field*; and, in the provinces, Byles of the *Bradford Observer*, Baynes of the *Leeds Mercury*, Cowen of the *Newcastle Chronicle*, and others have been displaced. The last of the monarchs of Fleet Street to give up their splendid isolation were the Lawsons of the *Daily Telegraph*. It was a shock to the newspaper world when, in December 1927, the second Lord Burnham sold the paper which his grandfather founded and his father—a newspaper genius—installed in the first place in British journalism.

New Owners of the Press.—New magnates have assumed power. No longer are newspapers the personal properties of the Borthwicks, Lawsons and the Walters; they belong to shareholders who entrust their money to the care of a directorate. Greatest of the new barons of the press are the Harmsworths, headed by Viscount Rothermere. The Berrys, the newest monarchs in the newspaper world, are still young in their generation, and Lord Beaverbrook—a Canadian by birth—has not lived in England 20 years.

The most spectacular financial newspaper deal was that involved in the creation of the *Daily Mail Trust*, Limited. It was incorporated on Sept. 27, 1922 and purchased the 400,000 deferred (controlling) shares in Associated Newspapers, Ltd., as sanctioned by the court on the death of Lord Northcliffe. The price paid was £1,600,000, which was met by an issue of 7 per cent first mortgage debentures. Early in 1923 the trust purchased 49 per cent in the *London Express Newspaper*, Ltd. A little later it purchased the large newspaper business of E. Hulton and Company, Ltd., and paid for it by a second issue of £8,000,000 7 per cent debentures, liquidating out of the proceeds the former issue of £1,600,000 debentures. At the same time the trust retained 49 per cent interest in *The Evening Standard*, which had been included in the Hulton group but was transferred to Lord Beaverbrook. In the same year the trust sold the greater portion of the Hulton press to the Berry brothers for more than the original purchase price, while retaining possession of *The Daily Sketch*, *The Sunday Herald* and new printing works; these three assets being subsequently promoted and sold for £1,600,000 under control of Lord Rothermere. The trust paid £4 for the deferred shares in Associated Newspapers, Ltd. They appreciated almost as much again. The trust in two years discharged a debenture obligation of £9,000,000.

The Rothermere Group.—The most powerful newspaper group in Great Britain is that controlled by Lord Rothermere, not because of the number of newspapers combined or associated, but on account of their predominantly national character and the immense financial resources behind them. The chief Rothermere groups are:—

The Associated Newspapers, Ltd., owning the *Daily Mail*, *Evening News*, *Sunday Dispatch*, *Overseas Mail*.

Capital:	£
5% Cumulative Preference shares	500,000
7% Cumulative Ordinary shares	600,000
Deferred shares	2,250,000
Total	£3,350,000

Daily Mirror Newspaper, Ltd.

Capital:	£
8% Cumulative Preference shares	800,000
Ordinary shares	1,400,000
Total	£2,200,000

In the spring of 1928 the ordinary shares of the *Daily Mirror* and Associated Newspaper Companies were converted each into four shares of a nominal value of 5s. The value of these shares in the summer of 1928 was in the case of the Associated Newspapers 24s., and in the case of the *Daily Mirror* 35s.

Sunday Pictorial, Ltd.

Capital:	£
8% Cumulative Preference shares	500,000
£1 Ordinary shares	1,500,000
Total	£2,000,000

These companies are shareholders in the *Daily Mail* trust, controlled by Lord Rothermere, already referred to. The financial strength of the Rothermere newspapers is not indicated by the amount of dividends which they distribute, as they build up great reserves and have no prior debenture or other charges.

In Feb. 1928, Lord Rothermere also promoted *Northcliffe Newspapers, Ltd.* (share capital £2,500,000; loan capital £3,000,000, 5½ per cent guaranteed debenture stock), primarily for establishing or acquiring "in selected centres of large population throughout the country evening newspapers which, by reason of possessing the advantages of extensive organization and large resources, will be the most up to date in the country."

It was stated in the prospectus that the surplus assets of Associated Newspapers and of the *Daily Mirror* were respectively £5,129,000 and £2,500,000—excluding good will and all liabilities.

The debenture stock was guaranteed by the Associated Newspapers, Ltd.; and the *Daily Mirror* Newspapers, Ltd. The 5 per cent. debenture stock was very much oversubscribed. The share capital was divided into £2,400,000, £1 ordinary shares and £100,000 £1 management shares. Two shillings was paid on all the management shares and on £1,400,000 ordinary shares, so that the company started with capital in cash amounting to £3,150,000, with £2,260,000 uncalled share capital.

During the summer of 1928 *Northcliffe Newspapers, Ltd.*, acquired several prominent newspapers and made arrangements to start new evening newspapers in selected centres as announced in the prospectus. The *Daily Mirror* Company, acting independently or in association with *Northcliffe Newspapers*, acquired several well-established evening newspapers and founded a regional Sunday paper at Stafford.

The capital of the various Rothermere companies does not by any means indicate their financial strength and great earning capacity. They possess a complete dual organization between the Associated Newspapers and the *Daily Mirror*, and are building up a third national organization in the *Northcliffe Newspapers*. All these newspapers are safeguarded in regard to the supply of paper; they control mills in Newfoundland, Canada and England. The following table shows the capitalisation of their paper making companies:—

Anglo-Newfoundland Development Co., Ltd.

Capital issued	{ \$6,439,585, Ordinary Shares.
	{ \$2,426,010, 8% Cumulative Preference Shares.
	{ \$1,594,255, Second Preference Shares.

As at 31-8-27 { £ 280,625, 5% Debentures.
{ £1,118,650, 6% Second Mortgage Bonds.

The Associated Newspapers Limited hold a majority of the Ordinary Shares.

A. E. Reed & Company Limited

Capital:	{ 293,970, 6% First Mortgage Debenture.
	{ 240,000, 6½% Cumulative Preference Shares.
	{ 225,000, Ordinary Shares.

Daily Mirror Newspapers Ltd., hold a majority of the Ordinary Shares.

Bowaters Paper Mills Limited

Capital:	{ 275,000, 7½% Cumulative Participating Preference Shares.
	{ 295,600, 6½% First Mortgage Debentures.
	{ 193,000, Ordinary Shares.

Majority of Ordinary Shares held by W. V. Bowater & Sons Ltd., which is in turn controlled by "*Daily Mirror Newspapers Ltd.*"

The Empire Paper Mills (1922) Ltd.

Capital:	{ 400,000, Ordinary Shares of £1 each.
----------	--

All the shares are held by Associated Newspapers Ltd.

Anglo-Canadian Pulp & Paper Mills Ltd.

Capital:	{ \$8,000,000, 7% Preference Shares. (Cumulative from October, 1929.)
	{ 3,000,000, 6½% Mortgage Debentures.
	135,000 Shares of Common Stock of no par value.

The Berry Group.—The largest newspaper proprietary in Great Britain and in the world is that controlled by Sir William and Sir Gomer Berry, whose rise in the newspaper business has been as romantic as their success has been phenomenal. Their vast interests are the creation of little more than ten years' activities.

The founder of the business, William E. Berry, like Alfred Harmsworth before him, served an apprenticeship in the humble spheres of journalism, beginning on the *Merthyr Times*. He went to London in 1898 as sub-editor on the *Investors' Guardian*, and though he quickly showed a special penchant for financial journalism, he worked on the staffs of several papers before launching out as a newspaper proprietor. In 1901 he started the *Advertising World*, the first production of the kind in the United Kingdom, and in the same year was joined by his brother Gomer. Together they started and owned various weekly and monthly papers, and when in 1915 they acquired the *Sunday Times* and introduced a new vitality into that old established newspaper they were already recognised as important newcomers to the press industry. In quick succession they acquired the *Graphic*, the *Daily Graphic*, the *Bystander*, the *Financier*, the *Financial Times*, the old established house of Cassells, with its periodicals and big publishing business, and Weldon's Fashion Journals. In 1923 they bought *Kelly's Directories* including the famous *London Post Office Directory*. Later an alliance was formed between the company owning *Kelly's* directories and Iliffe and Sons who own a leading group of trade and technical journals. Large printing works went with these two concerns. While the foregoing were big transactions from the financial point of view the Berrys were not firmly established in the newspaper world until 1924 when they bought most of the publications of Edward Hulton Ltd. which had been acquired by Lord Rothermere and Lord Beaverbrook, and formed the Allied Newspapers Ltd., which included the *Sunday Times*. The group contained widely circulated and popular newspapers, including the *Manchester Daily Dispatch*, the *Manchester Evening Chronicle*, the *Sunday Chronicle*, the *Empire News*, the *Sporting Chronicle*, and sundry other publications. About the same time they took over the control of another important newspaper property, the *Sheffield Daily Telegraph* and *Evening Telegraph*, with a number of popular periodicals. Another big milestone in their progress was reached in the following year when they bought all the newspapers in Newcastle except one, namely the *North Mail*, the *Newcastle Evening Chronicle*, the *Sunday Sun*, etc., and simultaneously acquired the *Glasgow Daily Record*, the *Glasgow Evening News*, and *Sunday Mail*. To this group was added in 1926 the *North Eastern Daily Gazette* of Middlesbrough, and the Allied Northern Newspapers Co. Ltd. formed with a capital, including debentures, of four million pounds. Very soon afterwards the Berrys purchased from Lord Rothermere the two papers which he had retained from the

Hulton group, namely, the *Daily Sketch* and the *Sunday Graphic*, which were formed into a separate company. Towards the end of 1927 Sir William and Sir Gomer Berry—both having been made baronets in recognition of their public services, Sir William in 1922 and Sir Gomer in 1927—startled the newspaper world by acquiring the *Daily Telegraph* from Lord Burnham and his family. Sir Edward Liffe was a partner in this transaction. The new owners immediately began to put new life into this sound and sedate organ of the English commercial and middle classes. Important paper making works went with the newspaper. The capital involved in this transaction has not been made public.

It is probable that the Berrys would have been content to have consolidated their properties but in 1928 a new newspaper war was started and they took up the challenge. They bought the *Derby Express*, the *Bristol Times and Mirror*, the *Bristol Evening Times*, the *Aberdeen Press & Journal* and the *Aberdeen Evening Express*.

For several years the Berry family have had control of the *Western Mail* and *Evening Express*, Cardiff, and in August 1928 bought the *South Wales Daily News* and *South Wales Echo*—the other papers in Cardiff.

While the foregoing list of newspaper properties controlled by the Berry companies are a formidable combination they do not by any means complete the wide range of their interests in the publishing business. In 1927 they bought the Amalgamated Press Ltd., the business founded by the late Lord Northcliffe and his brother Lord Rothermere. It was largely in the hands of the trustees of the Northcliffe estate and the Berrys were the successful bidders. It is the largest periodical business in the world and publishes over 120 weekly and monthly publications. Its capital was £3,000,000. The Berrys paid £9,000,000 and have paid dividends on the increased capital.

Like all big combinations the Berrys proceeded to safeguard themselves regarding the supply of raw material. They acquired with the Amalgamated Press the Imperial Paper Mills and in 1927 bought the famous Edward Lloyd Paper Mills, the biggest single concern of the kind in the world, so that they became the biggest paper manufacturers in Great Britain, as well as the largest newspaper and periodical owners.

The issued loan and share capital of the various Berry enterprises belonging to public companies was, in the summer of 1928, as follows:

	£
Allied Newspapers Ltd.	8,250,000
Allied Northern Newspapers Ltd.	4,000,000
<i>Daily Sketch</i> and <i>Sunday Graphic</i> Ltd.	2,584,096
<i>Financial Times</i> Ltd.	1,500,000
Kelly's Directories Ltd.	1,131,372
Weldon's Publications Ltd.	385,000
Amalgamated Press Ltd.	9,200,000
<i>Bristol Times and Mirror</i> Ltd.	138,337
Aberdeen Newspapers Ltd.	188,310
Edward Lloyd Investment Co. Ltd.	4,500,000

The capitalization of the Cardiff newspapers and the one in Derby has not yet been published, but will probably be £1½ million.

The Berry press "trusts" have not provoked the same criticism among public men or fears from journalists as has been the case with other newspaper combinations because they have not used their powers to push themselves or to run particular policies. They have maintained the character of the publications acquired, retaining local management and giving their editors considerable latitude. They have not over-centralized. So far as the reading public of the different papers are concerned they do not notice marked changes in the appearance and character of the publications. The centralized control is mainly commercial and financial. All the Berry companies are financially successful. Their progress has been steady and while their loan capital is heavy their earning capacity has up to now increased and the ordinary shares stand at a premium.

Apart from periodicals which number about 200 the Berry combinations control in London three daily newspapers and two Sunday newspapers; in the provinces, eight morning, eight evening, three Sunday newspapers; fourteen weekly newspapers; in

Scotland two morning, two evening, and two weekly newspapers and one Sunday newspaper.

The Beaverbrook Group.—The Beaverbrook group, in which Lord Rothermere has a minority interest, consists of *The Daily Express*, *The Sunday Express*, owned by London Express Newspapers, Ltd. (capital £539,439), and *The Evening Standard*. The policy of Lord Beaverbrook has not been to distribute dividends on the ordinary shares, but to extend plant and building, reduce capital and organise a future impregnable position.

The commercial possibilities of Lord Beaverbrook's newspapers have not yet been tested. Judged by the rapid expansion which they have made in recent years and the volume of advertising which they carry it is a fair assumption that if the intensive development policy were discontinued these journals would be next to the Associated Newspapers in earning capacity.

Daily Chronicle Group.—The *Daily Chronicle* Investment Corporation Trust was formed in July 1927 to take over the properties of the United Newspapers (1918) Ltd., with a capital of £3,050,000 consisting of £800,000 7% first cumulative preference shares, £700,000 8% second cumulative preference shares, £1,400,000 ordinary shares, 1s each, and 3,000,000 deferred shares of 1/- each. The corporation owns the *Daily Chronicle*, the *Sunday News*, the *Edinburgh Evening News*, the *Yorkshire Evening News*, and the *Doncaster Gazette*.

In July 1928 after the death of Sir David Yule and the retirement of Sir Thomas Catto, their interests were acquired by Mr. William Harrison on behalf of the Inveresk Paper Co., Ltd., of which he was chairman. Mr. Harrison had previously entered the newspaper field by acquiring the *Lancashire Daily Post*, Preston, and an interest in the *Hull Daily Mail* and *Grimsby Telegraph*. Besides his interests in daily newspapers, Mr. Harrison, as already mentioned, is chairman of Illustrated Newspapers, Ltd., which own nearly a dozen illustrated and trade papers. Mr. Harrison also controls most of the paper-making mills in Great Britain outside of newsprint mills.

The Starmer Group.—This is an association of 32 provincial newspapers with London headquarters at Newspaper house. The founders were the Rowntree family and Sir Charles Starmer, who began his newspaper career on the *Northern Echo* (Darlington). With the Rowntrees and Lord Cowdray, he built up this group, which includes the *Northern Echo*, *Sheffield Independent*, *Sheffield Mail*, *Nottingham Evening News*, *Nottingham Journal*, *Birmingham Gazette*, *Yorkshire Observer*, *Yorkshire Gazette*, *Bradford Telegraph* and *Argus*, *Birmingham Evening Dispatch*, *Lincolnshire Chronicle*, and a number of weeklies. The *Westminster Gazette* (morning paper) belonged to this group until its merging with the *Daily News* in Feb. 1928.

Other Combinations.—A financial group was promoted in July 1928 comprising the *Financial News*, the *Investors' Chronicle*, half interest in the *Economist*, the *Banker*, and the *Liverpool Journal of Commerce*, with a share capital of £550,000. One condition was that the editorship of the *Economist* should always be independent. The promoters of the issue were the printing firm of Messrs. Eyre and Spottiswoode.

Among the largest combinations of newspaper properties outside the big combines may be mentioned:

The Liverpool Daily Post and Echo Ltd., which owns the *Daily Post*, *Liverpool Echo*, *Liverpool Courier* and *Express*—all the newspapers in the city and neighbourhood.

The Consolidated Newspapers, Ltd., belonging to Sir Leicester Harmsworth, owns the *Western Morning News*, the *Mercury*, and the *Evening Herald*, Plymouth—the only morning and evening papers in that town—an evening paper in Exeter, and one in Torquay. In the summer of 1928 Sir Leicester Harmsworth acquired the *Field*, the *Queen*, and the *Law Times*.

The *Glasgow Herald* (Outram & Co.) Ltd., of Glasgow, with the *Bulletin* (an illustrated morning paper), the *Evening Times*, and the *Citizen*.

D. C. Thomson & Co., Ltd., own all newspapers and publications in Dundee, including the only morning and the only evening paper in that city, a Sunday newspaper, and a large number of weeklies.

The Yorkshire Conservative Newspaper Co., Ltd., are the proprietors of the *Yorkshire Post*, including *Yorkshire Evening Post*, and *Leeds Mercury*.

Anglo-Foreign Newspapers, Ltd., formed in Jan. 1929, has acquired interests in various newspapers and trade journals.

Organisations.—A net-work of organisations exists for employers and workers. In the newspaper business collective bargaining is the rule. On the employers' side, there is the Newspaper Proprietors' Association, which represents the London press, the Newspaper Society for the provincial press, the Scottish Newspaper Proprietors' Association, and the Irish Newspaper Society. There is also the British Trade and Technical Trade Journals Organisation.

Since 1913 the position of the working journalist has been vastly improved by the continued activities of the Institute of Journalists, incorporated by royal charter in 1890, and more especially by the influence exercised by the National Union of Journalists, founded in 1907, which is a trade union and has been the means of raising the standard among working journalists and of establishing the principle of minimum salaries.

At first competitive, the two bodies now show a tendency to become mutually complementary, the institute specialising in the professional, cultural and benevolent interests of the journalist, and the union concerning itself primarily with questions of salaries, hours and working conditions. The institute gives full membership to all bona fide journalists; the union restricts voting membership to journalists who cannot exercise the powers of an employer; thus, generally, editors, managing editors, and director-journalists are not eligible for full membership of the Union, and favour membership of the chartered body.

On the side of the manual workers there is also a complete net-work of organisations. The chief federated societies are the Typographical Association, representing compositors throughout the country; the London Society of Compositors; the National Society of Operative Printers and Assistants and Printing Machine Managers. Press telegraphists; correctors of the press; electrotypers and stereotypers; pressmen; paper-makers and others engaged in connection with newspapers, all have their unions. Beyond the federated societies is a large number of affiliated federations covering Great Britain.

Advertisers have organisations also, including advertising managers, circulation managers, and, indeed, every one associated with the production and distribution side of the press. Newsagents combine chiefly in the Federation of Wholesale Newsagents and the National Federation of Retail Newsagents.

The General Strike and the Press.—A development of the coal dispute in England, which came to a head at the end of April 1926, was a general strike organised by the General Council of the Trades Union Congress. An important preliminary incident was a stoppage of work which occurred in the office of the *Daily Mail*. (See GENERAL STRIKE.)

After the first few days certain newspapers began to re-appear in the first instance mostly by photographic processes, in two or four diminutive pages, which were gradually increased in size as voluntary labour was obtained. The Government by voluntary labour issued from the office of the *Morning Post* the *British Gazette*, which was under the control of Winston Churchill. It soon attained a very large circulation. The Trades Union Congress retaliated by producing the *British Worker* by trade-union labour. The newspaper and periodical business probably suffered more by the strike than any other industry, as a considerable proportion of the staff had to be retained and heavy general expenses incurred. The general strike was called off on Thursday, May 13, and after negotiations the newspapers resumed normal production on Tuesday the 18th.

After the strike an agreement was entered into between all organizations representing employers and employed which defines the functions of both parties. The agreement between the Newspaper Proprietors' Association and the respective unions, which was a notable landmark in collective bargaining, is as follows:—

1. There shall be no interference with the contents of newspapers owned by members of this Association.
2. There shall be no interference with, or victimisation of, any mem-

bers of the staff who worked or returned to work during the strike, either in their own or in any other office. Nor shall there be any victimisation by the employers.

3. There shall be no interference by members of the unions with the management of businesses, or with the right of the management to employ, promote, or discharge members of the staffs. Nor shall it be necessary for private secretaries or managers of departments not engaged in production to be members of a union.

4. No chapel meetings shall be held during working hours.

5. The strict observance of agreements in the newspaper trades shall be regarded as a matter of honour affecting each individual employer or employee.

Empire Press Union.—An organization which represents not only the Press of Great Britain but of the Dominions is the Empire Press Union, which was the outcome of the first Imperial Press Conference held in 1909. It represents newspapers, either by proprietors or responsible members of the staff. It has branch sections in the overseas dominions and keeps a permanent supervision over such questions affecting cable services and charges, and matters of common interest to the press as a whole. The second Imperial Press Conference was held in Canada in 1920, and the third in Australia in 1925. The first president of the Empire Press Union was the first Lord Burnham, and he was succeeded by his son, the present Lord Burnham. The chairman of the Council from 1915–26 was Sir Robert Donald, who was succeeded by J. L. Garvin, and was followed by Major the Hon. J. J. Astor. The Empire Press Union has insisted continuously on better and cheaper communications with the overseas dominions and has devoted particular attention to the promotion of empire wireless.

Page Fellowship.—American newspaper fellowships in memory of Walter Hines Page, the great ambassador, were established by the English Speaking Union of the United States in 1926 for the purpose of promoting more understanding among other English-speaking people through the medium of the press. Fellowships are awarded to British journalists who spend a year in the United States actually at work on newspapers and in the study of public questions. A British committee in co-operation with the English Speaking Union of the British empire selects the fellows, the first of whom was J. A. Spender, who spent three months in America in 1927.

International Press Conference.—The first international conference of newspaper experts held under the auspices of the League of Nations was held at Geneva in August, 1927. It was attended by editors and newspaper men from all over the world. Lord Burnham, then president of the English Newspaper Proprietors' Association and the Empire Press Union, presided. A series of resolutions were passed dealing with tariffs for telegraphs, telephones and wireless and improvement in communications, transport of newspapers, professional facilities for journalists, which have been referred to the League's organization for communications and transit for study and report. Other resolutions referring to postal subscriptions to newspapers, protection of news, censorship in peace time and facilities for travel tours, scholarships, railway fares, repressive measures, etc., will be considered by the Council of the League.

JOURNALISM AND JOURNALISTS

Although there is a well-defined qualification and status for civil servants, clergymen, doctors, dentists, barristers, solicitors, chartered accountants, journalism still continues to be such an indeterminate calling that there is no precise qualification or status for a journalist. The editor of *The Times* is equally a journalist with the more humble, but in his sphere no less necessary, police court reporter, and there are many people who call themselves journalists who supplement incomes from other sources by contributions to newspapers and periodicals. Especially during the present century there has been a notable increase in the number of people who have made their mark in other spheres, in politics, the Church, and public fields of activity to embark in journalism and compete with the regular journalist for considerably higher emoluments, and so general has this practice become that the prime minister of Great Britain, Stanley Baldwin, was able to announce as a matter of self-congratulation that he had never contributed for payment an article of any sort to a newspaper.

Several efforts have been made by the Institute of Journalists to create a standard that would result in every working journalist having to undergo such training and pass such examinations as are necessary in the recognized professions. Courses of journalism at the University of London following a series of lectures organized by Sir Sidney Lee during the World War were established in 1922 and have been well supported. Since 1923 exhibitions to the journalism courses to the value of £1,000 per annum have been awarded. The journalism committee of the University of London has also arranged for the delivery of addresses by well-known journalists and literary men.

Generally speaking, the staff of a national daily newspaper consists of an editor-in-chief, an assistant editor, a day editor, a night editor, a news editor, with his staff of reporters, a foreign editor, with a staff of sub-editors, the chief sub-editor, with a staff of sub-editors (one of whom in some offices has the unattractive description of "copy-taster," because he classifies and distributes the "copy" or news material as it comes in), in addition to a literary editor, sporting editor, dramatic, film and music critics, leader writers, and experts on such subjects as the fighting services, motoring, wireless, racing and golf. That is the interior journalistic organization, as distinguished from the managerial, advertising and numerous other departments. The exterior organization includes a chain of correspondents all over the country and in the capitals of the world.

The legal relations of the Press to the public are dealt with elsewhere (see PRESS LAWS, LIBEL, COPYRIGHT, CONTEMPT). So far as the relations of a newspaper staff with its employers are concerned, journalists are subject to the same law of contract of service as any other persons, subject to a custom by which in the absence of any contract, the following periods of notice must be given: editors and assistant editors, from six to twelve months, according to the relative standing of the newspaper; sub-editors, from three to six months; reporters, from one to three months. As a rule there are special circumstances which are decided by a jury on the merits, and the schedule given above has not yet received judicial recognition as a custom irrespective of the facts and the position of the newspaper, though it has been followed by the courts in the main. The editor is responsible for everything that goes into his paper, even the advertisement columns, and if a libel or contempt creeps in inadvertently he is expected to shoulder the responsibility in relation to the outsider rather than the contributor or the sub-editor that passed the offending matter, though the latter as a rule has to submit to disciplinary treatment within the office.

Subordination of the Editor.—Compared with 50 years ago, the most marked change in the personal side of British journalism has been the ascendancy of the proprietor and the subordination of the editor. This is reflected in the now prevailing habit of referring to the Rothermere press, the Beaverbrook press and the Berry press. There are now only a few well-known editors whose personalities are impressed on the public mind. First, there is C. P. Scott, the veteran editor of *The Manchester Guardian*, who is also one of the proprietors of his paper. C. P. Scott represents the finest type of editor-proprietor in England, while his journal, distinguished for its honesty and consistency, stands for the highest ideals of journalism and has acquired a great international reputation and influence. It has been under the control of C. P. Scott for over half a century. On the occasion of the centenary of *The Manchester Guardian* in May 1921, King George congratulated C. P. Scott on his 50 years' association with the paper which, "under your courageous and high-minded guidance, has secured for itself a position of such eminence and esteem in the world of journalism."

The other great personality in English journalism is J. L. Garvin, editor of *The Observer*, who is pre-eminent as a writing editor, brilliant and independent. He is a recognised authority on foreign affairs, and has exercised an influence on world politics for many years. In 1926 he took on new responsibilities, becoming editor of *The Encyclopædia Britannica* and chairman of the Empire Press Union. Four editors of London papers who were controlling policies before and during the World War lost their

posts, partly through proprietorial changes. H. W. Massingham, who had been editor of two daily newspapers and, afterwards of *The Nation*, died in 1924, soon after he was displaced from the editorship of that journal; A. G. Gardiner, of *The Daily News*, J. A. Spender, of *The Westminster Gazette*, and Sir Robert Donald, of *The Daily Chronicle*, who had all for many years been controlling editors, left their positions during these years.

The proprietor who pushes himself before the public occasionally prints signed articles in his papers. He uses them as vehicles for expressing his personal views. One effect of the change, accentuated by the syndication of newspapers, is that consistency is not so well maintained and editorial responsibility is very much weakened. The old conception of an anonymous entity, who regarded a newspaper as a public trust and took responsibility seriously, has been dispelled. One individual may be in financial control of several or many newspapers; but as organs of opinion they either become a "gramophone press," or different interpretations are given to the same policy in papers under the same ownership. The mass production of public opinion does not carry weight.

The Times has reverted to its traditional policy, as the first newspaper in the world, occupying its place with easy dignity. Its scholarly editor, Geoffrey Dawson, maintains anonymity, while the controlling proprietor, Hon. J. J. Astor, M.P., maintains the reserved tradition of the Walters. The change has, however, assured *The Times* the position of independence as a national newspaper. When *The Times* Holding Company, Ltd., acquired Lord Northcliffe's controlling interest in the newspaper, special restrictions and conditions were introduced, which provided that none of the shares may be transferred to any person other than Major Astor or John Walter, unless or until such person shall have been approved as a proper person to hold ordinary shares in the company by a resolution of the committee which the articles of association appointed. The same restriction applies to a corporation. The committee consists of the persons who for the time being are the lord chief justice of England, the warden of All Souls college, the president of the Royal Society, the president of the Institute of Chartered Accountants and the governor of the Bank of England. The decisions of this committee must be by a majority of votes, the chairman to have a casting vote. In exercising their decision in regard to the transfer of shares the committee must have regard to the importance of maintaining the best traditions of *The Times* newspaper, and national rather than personal interests, and eliminating as far as reasonably possible questions of personal ambition and commercial profit.

Lord Rothermere only occasionally contributes articles to his newspapers, and then only on subjects upon which he holds strong personal views.

Sir William Berry and Sir Gomer Berry carry on their vast and varied interests in a commercial spirit without bringing their personalities before their many millions of readers. An arresting personality in the British Press is Lord Beaverbrook—controlling proprietor of *The Daily Express*, *Sunday Express* and *Evening Standard*. He went into the newspaper business during the World War and it was not long before he showed striking gifts for the particular kind of journalism which he took up. He has the news and the political sense highly developed and if he frequently annoys he always interests.

Cheaper Communications.—Cheaper and quicker means of communication and distribution of news is always in process of evolution. What are known as "loaded cables" have been laid down, increasing enormously the capacity and speed by which messages can be transmitted by cable, the advantages of which newspapers will share. In the address to the Institute of Journalists in 1913, to which reference has already been made, Sir Robert Donald visualized a time when news would be collected by wireless telephone and the reporter would always have a portable telephone with him, with which to communicate with his paper without the trouble of going to the telephone office, or writing out a message. The competitor, he said, to the national newspaper would not be another national newspaper, but

a method of circulating news by means of some scientific mechanism for transmitting the spoken word. He predicted that all the news of the day would be laid on to houses and offices, just like gas and water. During the years 1924 and 1925 the development of broadcasting brought this vision within the region of realisation. Newspapers look on this development with a watchful eye, lest it should, in addition to supplementing their functions, arrest their progress.

A revolution has taken place in long distance communication. New inventions have quadrupled the carrying capacity and speed of submarine cables and simultaneously short wave or beam wireless has more than caught up with the cables. On the main world routes where the two systems have come into competition the cables have suffered. This development in wireless, which was due to Senatore Marconi, has definitely established wireless as the cheapest and quickest means of communication over long distances and has therefore rendered a valuable service to the press. Cables are, however, more efficient in direct communication and have greater accuracy. On the other hand wireless can reach all parts of the world and will link up vast territories which will never be connected by telegraph. In fact it is doubtful whether more cables will be constructed except in association with wireless. The services should be complementary.

The interest of the press in these developments is to get the advantage of cheaper and quicker means of communication. In contracts proposed for wireless services to the British Government and in resolutions passed by Imperial Press Conferences, it was always assumed that the tariff for wireless would be one-third less than cable rates. When the beam and short-wave system came into operation in 1927, it was proved that wireless could operate profitably at these reduced rates. As this competition was threatening the existence of cables, the British Government called an Imperial Conference in 1927, which sought a solution of the problem in the interest of empire communication, by endorsing a merger of all cable and wireless undertakings within the British empire. It was assumed that under unified control the users, including the newspapers, would get better service at lower rates.

More revolutionary than long distance wireless was the introduction of receiving illustrations by wire. The chief London newspapers began in 1928 reproducing wireless pictures of events which took place thousands of miles away and it is expected that this development will become a regular feature of the press in a few years' time. The use of wireless telephony will also become more general. The effect of all these developments will be to widen the scope of newspapers and bring the people of the world closer together.

The Future of British Newspapers.—The revolution which took place in English journalism immediately preceding, during, and after the World War was characterised not by improvements in the traditional features of newspapers, but by the introduction of extraneous elements. These extraneous elements and methods were intended to force sales by making people buy more than one paper and several copies of the same paper. They were also intended to keep readers once secured by non-journalistic attractions and thus permanently increase and stabilise sales. As sales were made the basis of advertising rates, after Lord Northcliffe had set the example of issuing sales certificates, it became imperative to maintain a ratio between sales and advertising rates.

The chief feature adopted to capture new readers and attach them to a newspaper was insurance. Newspaper insurance, beginning modestly both as regards the accidents covered and the amounts recoverable, increased enormously until many subjects besides accidents to registered readers were covered, and the payments reached £12,500 on death by a railway accident. By the middle of 1928 the *Daily Mail* had paid over £1,000,000 under its insurance scheme. From the readers' point of view newspaper insurance is a good investment. No premium beyond the price of the paper is necessary. The system suits newsagents too, as they add to their list of permanent purchasers. Some newspapers carry their own insurance, while others pay premiums to insurance companies in proportion to their sales. In every case insurance companies investigate and settle claims. It does not

seem that newspaper insurance has been inimical to normal insurance business. It is supplementary, not competitive.

Newspaper insurance has become a tremendous factor in the life of the people. Every year it is extended through its adoption by more newspapers and through the increase in payments. The newspaper which possesses the greatest financial resources will always lead in insurance. Heavy expenditure is incurred in the attempts to make insurance pay. An army of canvassers are employed, going from house to house in order to secure new readers; and poster and other advertising campaigns are carried on regardless of expense.

Newspaper insurance differs from company insurance. A company takes premiums from clients, but hopes that they may escape accidents and prolong their lives. Newspapers on the other hand seem to rejoice—in headlines—over fatal accidents which befall their readers and boast about the amount of money they pay out. One reader killed in a railway accident brings a hundred new readers into the net. Newspaper insurance has come to stay.

In addition to insurance many newspapers resort to a variety of competitions to capture readers. These competitions, some of which require little skill or knowledge, carry big prizes. The coupon system, which usually accompanies prize competitions, induced readers to buy many copies of the same issue for the sake of the coupon, as entries are not limited. This kind of coupon competition was declared by the High Court in October 1928 to be illegal and was stopped. There are many other competitions, including beauty contests and competitions referring to all kinds of sport. The cross-word puzzle competition has become almost universal and handsome prizes are offered for correct results. This is a competition which requires a certain amount of knowledge to solve. The general knowledge examination which has been adopted by all kinds of newspapers and periodicals demands greater intelligence, but in this case few prizes are offered.

The same comment applies to all competitions carrying prizes as to insurance—success depends on the amount of money spent in pushing schemes, and not so much on the merits of the schemes.

Other extraneous features have been introduced into journalism in the race for sales, or to stimulate advertisements, including devices by which readers may receive presents of various articles or beneficial considerations,—free trips, free entertainments, etc.,—State events are organized and exhibitions held. Newspapers which do not resort to these expedients to foster business find themselves at a disadvantage. There are examples of newspapers which contain more news and better reading matter than their contemporaries, but which, because they decline to adopt insurance, or competitions, or puzzles,—as undignified or incompatible with their conception of the mission of the press,—fall behind, become unprofitable, and unless subsidized for political reasons, cease to exist.

The modern newspaper caters for all classes. It is severely sectionalised, and while the interests touched upon are more comprehensive than they were twenty years ago, the space devoted to general news of the day is very much less. Except in the case of a few newspapers, speeches are not reported at any length, and politics is treated as a subject of minor interest. Newspapers have become more or less imitative, and no journal is permitted to get more than a day ahead with a new feature or a new development. While minor changes are numerous, there has been no revolutionary change in the characteristics of daily journalism since the days of Lord Northcliffe. The popular cross-word puzzle, the general knowledge questions, and the comic strips which have been almost universally adopted, are importations from America.

The widening of interest in the contents of newspapers, colossal sales, amalgamations, and local monopolies do not fully explain the phenomenal financial success of newspapers since 1918. As compared with pre-war times newspapers have doubled their selling price and quadrupled their charges for advertisements, but there has not been a commensurate rise in the cost of raw materials, of labour, or of transport.

The chief factor in making for newspaper prosperity has been the increase in advertising. Newspaper advertising has become a vital factor in national industry and salesmanship. There has

been a quickening of the business sense, a determination to open up new markets, to increase consumption. Simultaneously there took place in England a revolution in the methods and style of advertising. The advertising agent, instead of being a mere conduit pipe, has become a highly scientific expert. More firms have been induced to advertise, and the experience of scientific publicity has been followed by larger allocations for this branch of salesmanship. The newspapers have reaped the benefit of the originality, resource, thought and enterprise which the advertising consultants apply to their business.

All these factors in recent newspaper development have made the newspaper business more and more dependent on finance. The consolidation of the press has continued without a break since 1918,—amalgamations, syndicates, trusts have followed upon each other. The impetus given to advertising enabled companies which were over-capitalised when promoted to return handsome profits. The only break in the movement towards trustification came in 1928, when Lord Rothermere launched his scheme for competitive evening newspapers in the provinces. How that scheme, which was welcomed by advertisers and journalists, will develop remains to be seen. Only a man with powerful financial resources behind him could undertake such an enterprise. Few new newspapers will be started, because the syndicated press is firmly entrenched and can exhaust the resources of any ordinary competitor.

The future of the British newspaper, therefore, becomes a question of finance. It is estimated that three-fourths of the newspapers in England and Scotland, and a greater proportion of newspaper sales are controlled by large corporations or by local monopolistic companies. These big corporations are not going to dissolve, and local monopolies will not be challenged except by a corporation.

Multiple ownership of newspapers possesses all the commercial and financial advantages of other big businesses, but mass production and centralised control destroy individuality. As members of a big combine newspapers lose character: they tend towards a standardised type. They may be better productions than is possible under isolated ownership, but the old conceptions of a newspaper as an institution with a soul of its own, which could not be measured by ordinary commercial standards, is gone.

The paramount interest of press trusts is to earn dividends for shareholders. It may be that four or five corporations with several hundred thousand shareholders will compete vigorously, but fights for supremacy usually end in understandings, in division of territory, in agreements and amalgamations. It is quite probable that the whole press of England may fall under the control of two or three trustified ownerships acting in co-operation.

II. THE BRITISH DOMINIONS

Irish Free State.—Newspapers in the Irish Free State are settling down to dominion conditions, but it cannot be said that the new political freedom has stimulated newspaper enterprises. The Dublin morning papers are now *The Irish Times* and *The Irish Independent*, and the evening papers, *The Herald* and *The Dublin Evening Mail*. In 1910 there were four morning papers and three evening papers in the Irish capital. The historic *Freeman's Journal* passed through many vicissitudes, and finally disappeared in 1923, after 160 years of existence. There are two morning papers and one evening paper in Cork. British news-

papers, daily and weekly, have a considerable sale in the Irish Free State.

Canada.—There are no more independent newspapers than those published in the British overseas dominions. They are comparatively free from Government influences, and are not subject to the domination of syndicates or trusts. The press of each dominion has its own characteristics. Canadian newspapers not unnaturally reflect the style and appearance of American newspapers, while retaining some of the more sedate qualities of English journalism. There are no Sunday newspapers in Canada, although American Sunday newspapers are sold at railway stations and at hotels throughout the dominion. The evening press is more important than the morning press. Such evening papers as *The Montreal Star* and *The Toronto Globe* have very large sales and are second to none in enterprise. The Canadian press publishes a great deal of British news and carries American magazine features.

There are no national newspapers in Canada, as the Dominion is too vast for papers to circulate beyond the area of one province, but there are several newspapers of national reputation and wide political influence, such as *The Manitoba Free Press*, *The Montreal Gazette*, *The Toronto Globe*, *The Vancouver Daily Province*, and *The Halifax Chronicle*. In merit, such newspapers stand high, and Canadian journalists are continually being tempted to cross the border to fill important posts on the American press, and in recent years have been drawn in greater numbers to London. In some towns, such as Ottawa, the same papers have morning and evening issues. There are no big newspaper trusts in Canada. There is a chain under the same ownership including newspapers in Hamilton, Ontario, Ottawa, Regina and Vancouver City, but otherwise the combines are local. There is a healthy French press in the Quebec province. *La Presse* of Montreal claims to have the largest sale of any newspaper in Canada, French or English. Every town in Canada, even if its population does not exceed 5,000, has a daily newspaper, as is the case in most communities in other British dominions. The trade and technical press of Canada compares well with similar papers in other countries. Monthly publications are at a disadvantage because of competition from the excellent cheap magazines and Sunday supplements from the United States, which regard the dominion as a dependency for periodical literature.

The small town of St. John's, population 38,645, in the large island dominion of Newfoundland, prides itself on having one morning and three evening newspapers.

Australia.—Australian newspapers are dignified in appearance and possess solid qualities. As the number of newspapers is comparatively few for a growing community, they are almost without exception highly prosperous and very efficiently equipped. In Melbourne, which with its suburbs has over a million inhabitants, there are only two general morning newspapers—*The Age* and *The Argus*, and a pictorial paper—and one evening paper, the *Herald*. Many attempts have been made at competition with the *Herald*, but all have failed.

The chief newspaper centre in Australia is Sydney, which has seven daily newspapers—four morning, two evening, and one commercial. The *Melbourne Age* and the *Sydney Morning Herald*, occupy a first position among empire newspapers. The *Daily Guardian* most resembles the popular newspaper in England.

With regard to the capitals of the other States of the Commonwealth, Brisbane has two morning and two evening dailies, Adelaide two morning and one evening, Perth one morning and one evening paper. Hobart, the capital of Tasmania, has only one paper. In several of the cities a daily commercial news-sheet is issued and a very large number of weeklies. The weekly newspaper occupies a very important place in Australian journalism as it covers a large number of smaller towns few of which have daily newspapers. An exception is Rockhampton, in Queensland, which although it has only a population of 31,000, boasts of one morning and one evening paper. Launceston, in Tasmania, which has only a population of 35,000 in the city and suburbs, contains one morning and one evening paper.

The Australian newspapers comprise numerous trade journals,

general weekly papers, and also humorous journals. The Sydney *Bulletin*, *Truth* and *Smith's Weekly* have the largest sale among weekly papers.

New Zealand.—With a total population of about 1,500,000 New Zealand has a very healthy newspaper press, in style and characteristics similar to the Australian newspapers. Wellington, the capital, with a population of 93,000, has one morning and one evening paper. Christchurch, which has 40,000 more population, has two morning and two evening papers; Dunedin one morning and one evening. Invercargill, with a population of only 22,000 has two morning newspapers. New Plymouth, with a population of 16,000, has one morning and one evening.

South Africa.—With a white population of less than a million and a half divided between the British and the Dutch, the Union of South Africa makes a good show in the matter of the press. The more important newspapers are in the English language. They include *The Cape Times*, *The Cape Argus* and *The Johannesburg Star*, which are first-class papers. Newspapers are sometimes printed in the dual languages. In Bloemfontein and Pretoria there are one Dutch and one English paper; in Durban, two morning newspapers in English. Johannesburg has fewer newspapers than one would expect from a city of its population and commercial importance: there is only one morning and one evening newspaper in English.

Newspapers in South Africa are divided into associated groups, and there are also combinations of news agencies, advertising and distributing agencies, all of which tends to handicap enterprise and limit the number of newspapers. The leading Dutch papers are *Die Burger* and *Ons Land* of Cape Town, and the *Volkstem* of Pretoria.

India.—Up to the removal (*see* PRESS LAWS) of the rigid newspaper licensing system in British India in 1835 under the inspiration of Macaulay there were very few British or vernacular newspapers. At the Mutiny in 1857 the restrictions were partly restored, and though the Indian press has grown tremendously in volume it is still subject to severe Government regulations. Apart from obscure native sheets there are about 200 newspapers and periodicals published in British India. The part played by English newspapers in India cannot be measured by the copies which they sell. In Calcutta, with a population of nearly 1,500,000, is published the oldest newspaper in India, *The Englishman* (1821), and also the most popular, *The Statesman*. *The Times of India* (Bombay), *The Madras Mail*, *The Pioneer of Allahabad*, *The Civil and Military Gazette* of Lahore, are the best-known papers and organs of opinion. There is quite a number of official journals in India. The vernacular papers are growing in number and in influence, and some of the Nationalist organs are published in English—as, for instance, the *Amrita Bazar Patrika* of Calcutta. Some papers are published in two languages, in English and vernacular.

III. NEWSPAPERS IN CONTINENTAL COUNTRIES

Freedom of the press in Continental countries has not kept pace with the development of political constitutions. Since the reconstruction of Europe after the World War there has been an increase of newspapers and particularly of organs of political opinion. In France, Germany, Belgium, Austria and Hungary, press conditions are somewhat the same as in pre-war days. In Russia there is practically no freedom of the press, and the same may be said with regard to Italy. In the new States of Czecho-Slovakia, Rumania and Yugo-Slavia, censorship and suppression of newspapers are carried on to as great an extent as before the war. In Poland there has been a revival of newspapers, but here again in regions inhabited by minority races the press is only tolerated. In all these new countries journalism is a hazardous profession, and has not gained in strength or dignity. In every country the extreme political Left is represented by propagandist newspapers, and while these journals are occasionally suppressed in the countries in which they are published, they are allowed to circulate in neighbouring countries.

Newspapers of France.—In no other country is the political influence of the press so great, or its literary merits so high, as

in France. In France journalism is literature and literature is journalism. Some of the greatest literary men of France have been created by the press; and the greatest literary critics have contributed to it. Journalism is also inextricably intermixed with politics. It was so in the time of Cardinal Richelieu, at the inception of the press, and in the time of Napoleon. Napoleon had great respect for the press. While he censored and suppressed journals he was always ready to use them to his advantage. There have been presidents of the republic, prime ministers, ministers, colonial governors, academicians and others who attain high positions in national life, who graduated through the press. When they retire, they return to their muttons. The most famous journalistic statesman was Georges Clemenceau, the great war premier. He retired a year after the treaty of peace was signed, and at the age of 80 was an unsuccessful candidate for the presidency. He did not profess disappointment at his failure, but consoled himself with the observation: "What matter? with good pen and paper one could be king of the world."

The outstanding features of French newspapers are the signed article, dramatic and literary criticism, the short story, and the small items known as *chronique*. The collection and presentation of news, as will be shown, was a late development in the history of the French press. Not many decades since it was said that French newspapers were dated to-morrow and contained the news of the day before yesterday. While the literary reputation of the French press stands high, its commercial and political morality is not on the whole quite so commendable. Many newspapers are run for, or by, ambitious politicians, or in some interest, and nearly all of them accept inspiration from the Foreign Office. Ministers change frequently but the system remains. It is like part of the constitution.

The annals of French journalism begin with the *Gazette* (afterwards called the *Gazette de France*), established in 1631 under the patronage and with the active co-operation of Cardinal Richelieu. The first editor and printer was Théophraste Renaudot. The first weekly number apparently appeared in May 1631. So much, at least, may be inferred from the date (4th July 1631) of the sixth number, which was the first dated publication. Each number of the paper, which cost 6 centimes, consisted of a single sheet (eight pages) in small quarto, and was divided into two parts—the first simply entitled *Gazette*, the second *Nouvelles ordinaires de divers endroits*. It commonly began with foreign and ended with home news. Much of its earliest foreign news came direct from the minister, and not seldom in his own hand. Louis XIII. took a keen interest in the progress of the infant *Gazette*, and was a frequent contributor, now and then taking his little paragraphs to the printing office himself, and seeing them put into type. In Oct. 1631 Renaudot obtained letters patent to himself and his heirs, conferring the exclusive privilege of printing and selling, where and how they might please, "the gazettes, news and narratives of all that has passed or may pass within and without the kingdom." At his death in Oct. 1653 Renaudot left the *Gazette* to his sons in flourishing circumstances. Its place is now filled by the *Journal Officiel*.

In 1672 the *Mercurie galant* was established by Donneau de Vizé. Its title was later changed to *Nouveau Mercurie*, and in 1728 to *Mercurie de France*, a designation retained, with slight modification, until 1853, when the paper finally ceased. It had many prominent contributors. In 1790 its circulation rose very rapidly and reached for a time 13,000 copies. Mirabeau styled it in debate "the most able of the newspapers." Great pains were taken in the collection of statistics and state papers, the absence of which from the French newspaper press had helped to depress its credit as compared with the political journalism of England and to some extent of Germany.

Under Napoleon the organ of official information was the *Moniteur* (*Gazette nationale, ou le moniteur universel*), founded in 1789 under the same general management with the *Mercurie*. The *Moniteur* kept step with the majority of the assembly, the *Mercurie* with the minority. So marked a contrast between two journals with one proprietor gave too favourable a leverage to the republican wits not to be turned to good account. Camille Des-

moulins depicted him as Janus—one face radiant at the blessings of coming liberty, the other plunged in grief for the epoch that was rapidly disappearing.

The only other newspaper of a date anterior to the Revolution which need be noticed here is the first French daily, the *Journal de Paris*, which was started on New Year's Day of 1777 and lived till 1819. Its period of highest prosperity may be dated about 1792, when its circulation is said to have exceeded 20,000. The *Journal des Débats*, which still flourishes, was founded in 1789 by Baudouin.

The cheap journalism of Paris began in 1836 (1st July) with the journal of Girardin, *La Presse*, followed instantly by *Le Siècle*, under the management of Dutacq, to whom, it is said—not incredibly—the original idea was really due. The first-named journal attained a circulation of 10,000 copies within three months of its commencement and soon doubled that number. The *Siècle* prospered even more strikingly, and in a few years had reached a circulation (then without precedent in France) of 38,000 copies.

The rapid growth of the newspaper press of Paris under Louis-Philippe will be best appreciated from the fact that, while in 1828 the number of stamps issued was 28 millions, in 1836, 1843, 1845 and 1846 the figures were 42, 61, 65 and 79 millions respectively. At the last-mentioned date the papers with a circulation of upwards of 10,000 were (besides the *Moniteur*, of which the circulation was chiefly official and gratuitous) as follows: *Le Siècle*, 31,000; *La Presse* and *Le Constitutionnel*, between 20,000 and 25,000; *Journal des Débats* and *L'Epoque*, 10,000 to 15,000.

The impulse given to the growth of advertisements in the days which followed July 1830 became, as the years rolled on, sufficiently developed to induce the formation of a company—in which one of the Laffittes took part—to farm them, or rather to farm a certain conspicuous page of each newspaper, at a yearly rent of £12,000 sterling (300,000 francs), so far (at first) as regarded the four leading journals (*Débats*, *Constitutionnel*, *Siècle*, *Presse*), to which were afterwards added two others (*Le Pays* and *La Patrie*). The combination greatly embarrassed advertisers, first, since its great aim was to force them either to advertise in all, whether addressing the classes to be canvassed or not, or else to pay for each advertisement in a selected newspaper the price of many proffered advertisements in all the papers collectively, and, secondly, because by many repetitions in certain newspapers no additional publicity was really gained, two or three of the favoured journals circulating for the main amongst the same class of buyers.

On July 16, 1850, the assembly passed what is called the "*loi Tinguy*" (from the name of the otherwise obscure deputy who proposed it), by which the author of every newspaper article on any subject, political, philosophical or religious, was bound to affix his name to it, on penalty of a fine of 500 francs for the first offence, and of 1,000 francs for its repetition. Every false or feigned signature was to be punished by a fine of 1,000 francs, "together with six months' imprisonment, both for the author and the editor." The practical working of this law lay in the creation of a new functionary in the more important newspaper offices, who was called *secrétaire de la rédaction*, and was, in fact, the scapegoat *ex officio*. The "*loi Tinguy*," though now long repealed, has had a permanent influence on French journalism in the continued prevalence of signed articles, and the consequent prominence of individual writers as compared with the same class of work in other countries.

In 1858 the order of the six leading Parisian papers in point of circulation was—(1) *Siècle*, (2) *Presse*, (3) *Constitutionnel*, (4) *Patrie*, (5) *Débats*, (6) *Assemblée*. The number of provincial papers exceeded five hundred. "Newspapers, nowadays," wrote a keenly observant publicist in that year, "are almanacs, bulletins, advertising mediums, rather than the guides and the centres of opinion." In 1866 the change had become more marked still. The monetary success of Girardin's many commercial speculations in this branch of commerce greatly increased the number of Parisian journals, whilst lowering the status and circulation of those of established rank. In 1872 the circulation of *Le Petit Journal* (founded 1863), the pioneer of the French halfpenny press,

was 212,500, and it went on rapidly increasing. In 1874 an elaborate return showed that in the 35 principal towns of France, comprising a population of 2,566,000 their respective journals had an aggregate weekly issue of 2,800,000 copies. In 1878 the total number of journals of all kinds published in France was 2,200. Of these 150 were political, strictly speaking, of which Paris published 49. Of Parisian journals other than political there were 1,141 (including 71 religious, 104 legal, 153 commercial, 134 technological, 98 scientific and medical, 59 artistic). At that date *Le Figaro* had a circulation of about 70,000, *Le Petit Journal* (at a halfpenny) one of about 650,000.

The law concerning the liberty of the press, of July 29, 1881, abolished suretyship for newspapers, decentralised their registration, and took away the former discretionary power, lodged in the home office, of interdicting the circulation in France of foreign journals. The home minister might still prohibit a single number of a newspaper; only the whole council of ministers, duly convened, could prohibit the circulation of a foreign newspaper absolutely.

The newspapers of Paris, and similarly of France, practically doubled in number between 1880 and 1900. In 1880 there were about 120 Paris newspapers, in 1890 about 160, and in 1900 about 240. The total number of newspapers, as distinguished from periodicals, published in France during 1900 was in round numbers 2,400, of which about 2,160 appeared in 540 provincial towns.

The history of the French press during the last twenty years of the 19th century followed very closely that of the country itself, Boulangist and anti-Boulangist, Dreyfusist or anti-Dreyfusist, Republican or Nationalist; finally it became either Moderate Republican or Radical Socialist, with a sprinkling of Nationalist organs and a small minority of Royalist and Bonapartist sheets.

The French papers, of whatever party, took an increased interest during this period in foreign matters and much improved their organisation for collecting news. *L'Eclair* gave less attention to the discussion of political questions from the party point of view than to the collection of news, and was followed by the *Echo de Paris* (1884) and *Le Matin*, which also dates from 1884, and which by an arrangement with the *London Times* gave every day a translation of most of the telegrams published in that newspaper. The *journal d'information*, as these papers were called, took its place beside the journal properly so-called, more perhaps as a rival than as a complement. The natural result followed, and the more old-type newspapers took steps to provide their readers with news as well as with leading articles, current and literary topics, society gossip, dramatic criticism and law reports. Nothing perhaps was so striking after 1890 as the demand of the French public for foreign and colonial news, or the readiness of the papers to supply it by means of special representatives independent of the news agencies. An enlargement of the individual newspapers followed, accompanied by a reduction of price.

In home matters the French press made greater progress still in the rapid and accurate collection of news, and in this respect the provincial press showed more enterprise and more ability than that of Paris. Its development was remarkable, for whereas in 1880 the inhabitants of the departments had to await the arrival of the Parisian papers for their news, they now had the advantage of being supplied every morning with local newspapers inferior to none of the best organs of Paris. Among the best provincial papers may be mentioned *La Gironde* and *La Petite Gironde* of Bordeaux, *La Dépêche* of Toulouse, *Le Lyon Républicain*, *L'Echo du Nord* of Lille, *Le Journal de Rouen*, all having a staff in Paris engaged in collecting news, reporting parliamentary proceedings and law cases, telegraphed or telephoned during the night and published early the next morning in their respective localities. Being perfectly independent of purely Parisian opinion or even bias, the decentralisation of the French provincial press became complete; it became also more independent politically than the Paris press. Several journals had and still have national reputations: the *Dépêche* of Toulouse, with its 12 editions daily, the *Progrès* of Lyons, the *Petit Marseilles*, *La Petite Gironde* of Bordeaux. The small local press exercises an independent influence during elections.

The French Press has been little changed by the World War. During the War many newspapers temporarily disappeared, owing to the lack of staff, or of means, or shortage of paper. All papers were under a severe censorship and, more than ever, were the servants of the Government.

In 1928 there were 337 journals published in Paris, of which two were official dailies. There were 127 sporting newspapers, of which five were dailies. The number of newspapers published in the provinces was 3,100, including publications of all descriptions.

France was the first country to have national newspapers with sales of over 1,000,000. The sale was stimulated more by two serial stories run by each paper than by news, but since the war news has become more conspicuous in such widely circulated papers as the *Petit Parisien* (1,200,000), *Le Petit Journal* (1,000,000), *Le Matin* (900,000), and the *Journal* (800,000), which may be described as the "Big Four of the Paris Press." Following upon these in point of sales comes the *Echo de Paris* (800,000). The better-known political papers are *Le Temps*, the venerable *Journal des Débats* (founded in 1789 by Baudouin), *La Liberté*, *L'Oeuvre*, *L'Humanité* and the *Ère Nouvelle*. The *Figaro* (begun 1854, but a daily from 1866) maintains its unique position. Characteristics of all the popular Press are still signed articles and serial stories. There is a popular daily illustrated paper, *Excelsior*, established 1910, and numerous dailies devoted to sport, finance, the drama, motoring, etc. Every phase of politics is represented in the Paris press, from Legitimist to Communist, and every trade and interest has its organ.

Improvements have taken place in the mechanical equipment of the French press in recent years, and there has been a marked increase in illustrated weeklies and monthlies. The best known weeklies are the dignified *Illustration* and the gay *Vie Parisienne*, which flourished during the war, the literary *Annales Politiques et Littéraires*, and a light variety paper *Nos Loisirs*. The *Revue des Deux Mondes*, the *Mercure de France* and the *Revue Hebdomadaire* are the best known monthlies. The sale of the French press is pushed all over Europe. The chief news agency, Havas, has official support. There is also a universal wireless service which broadcasts news and propaganda. It is a subsidiary of the wireless company, which holds a concession from the State.

English journalism in France was for nearly a century mainly associated with *Galignani's Messenger* (1814-1904), which was killed by the competition of the Paris edition of the *New York Herald*. It had been preceded by Sampson Perry's *Argus* (1809), a Napoleonic organ. In May 1905 a new era of English journalism on the Continent began by the institution of the Paris edition of the London *Daily Mail*. There are three other papers printed in English: the *Chicago Tribune*, the *New York Herald-Tribune* and the *Paris Times* (evening).

Newspapers in Germany.—Under the old German empire there was liberty of the press within reason, but certain papers were exploited or influenced by the Government for its own purposes. Before 1914 German journalists had begun to conquer positions in the political world, and the press was gaining in independence. To-day the German press has complete freedom. It is the most serious press in Europe. There are few sensational newspapers. Newspapers do not sell because of sport or "stunts." Journals which cater for the special interests of the working classes discuss economic and industrial problems, and do not merely confine themselves to news. Literature, the drama, art, music and economics occupy a greater proportion of space in German newspapers than in the press of any other country.

Printed newspapers in Germany begin with the *Avisa Relation oder Zeitung* (1609), followed by the *Frankfurter Journal*, in 1615 of Egenolph Emmel. The following year saw the foundation of the *Frankfurter Oberpostamtszeitung*—continued until the year 1866 as *Frankfurter Postzeitung*. Fulda appears to have been the next German town to possess a newspaper, then Hildesheim (1619) and Herford (1630). In the course of the century almost all German cities of the first rank possessed their respective journals. The earliest in Leipzig bears the date 1660. The *Rostocker Zeitung* was founded in 1710. The *Hamburgischer Correspondent* (1714) was originally published under the name of *Holsteinische*

Zeitungs-Correspondenz, two years earlier, and was almost the only German newspaper which really drew its foreign news from "our own correspondent." Berlin had in the 18th century two papers, those of Voss (the *Vossische Zeitung*, 1722) and of J. K. P. Spener (1749-1827; the *Spener'sche Zeitung*, or *Berlinische Nachrichten*, 1772). Some half-dozen papers which glimmered in the surrounding darkness were the reservoirs whence the rest replenished their little lamps. On the whole, it may be said that the German newspapers were of very small account until after the outbreak of the French Revolution. Meanwhile the ms. news-letters, as in earlier days, continued to enjoy a large circulation in Germany. Many came from London. The correspondence, for instance, known under the name of "Mary Pinearis"—that, apparently, of a French refugee settled in London—had a great German circulation between 1725 and 1735. Another series was edited by the Cologne gazetteer, Jean Ignace de Rodérique, also a French refugee, and remembered as the subject of a characteristic despatch from Frederick II. of Prussia to his envoy in that city, enclosing 100 ducats to be expended in hiring a stout fellow with a cudgel to give a beating to the gazetteer as the punishment for an offensive paragraph. The money, it seems, was earned, for Rodérique was well-nigh killed. At Berlin itself, Franz Hermann Ortgies carried on a brisk trade in these news-letters (1728-1735), until he too came under displeasure on account of them, was kept in prison several months, and then exiled for life. Nor, indeed, can any journal of a high order be mentioned of prior appearance to the *Allgemeine Zeitung*, founded at Leipzig by the bookseller Cotta (at first under the title of *Neueste Weltkunde*) in 1798. Its articles gave offence to the Austrian court, and the paper had to change both its title and its place of publication. It had been commenced at Tübingen, and removed to Stuttgart; it was then transferred to Ulm, and again to Augsburg. It was Cotta's aim to make this the organ of statesmen and publicists, to reach the public through the thinkers, to hold an even balance between the rival parties of the day, and to provide a trustworthy magazine of materials for the historians to come; and, in the course of time, his plan was so worked out as to raise the *Allgemeine Zeitung* into European fame. Cotta was also the founder, at various periods, of the *Morgenblatt*, which became famous for its critical ability and tact, of *Vesperus*, of *Das Inland*, of *Nemesis*, of the *Oppositionsblatt* of Weimar (for a time edited by Bertuch), and even of the *Archives Parisiennes*.

Whilst French influence was dominant in Germany, the German papers were naturally little more than echoes of the Parisian press. But amidst the excitements of the "war of liberation" a crowd of new journals appeared. Some of these journals lasted but two or three years. Most of the survivors fell victims to that resolution of the diet (Sept. 20, 1819) which subjected the newspaper press, even of countries where the censorship had been formally abolished, to police superintendence.

A similar crop of new papers of revolutionary tendency followed the upheavals of 1830 and 1848. These were equally short-lived, but it is nevertheless undeniable that a marked improvement in the ability and energy of the German political press may be dated from this period.

In Prince Bismarck's days the press bureau of the Prussian Ministry of the Interior, and a similar organization in the Imperial Home Office, used to furnish hundreds of petty local newspapers known as *Kreis-blätter* with whole articles gratis, so that the policy of the government might be advocated in every nook and corner of the country. The numerous journals in which these communications used to appear simultaneously and in an identical form were the government organs to which the Radical and Socialist opposition more particularly applied the term "reptile press." Later this practice of wholesale inspiration was abandoned, but there remained many channels, public and private, through which almost every department of the government could communicate information to newspapers in all parts of Germany.

At the beginning of the 20th century the position and influence of the German press were passing through a period of change. The Germans had become a newspaper-reading people. Indeed, with the remarkable growth of the commercial spirit in Germany

 meri beyon. to take away the pedage: from the
 Marquis Spinola.

The *Tägliche Rundschau*, which spoke authoritatively on foreign affairs, ceased publication on June 30, 1928. The more popular papers in Berlin have sales exceeding 250,000. Among the most widely circulated papers outside Berlin are the *Düsseldorfer Nachrichten* (Independent-National), which reaches the same figure, the *Frankfurter General-Anzeiger*, 115,000, the *Hamburger Anzeiger*, 110,000, the *Leipziger Neueste Nachrichten* (Patriotic), 175,000, the *Müncher Neueste Nachrichten* (National), 145,000, the *Dortmund General Anzeiger* (non-party), 122,000, and the *Dresdener Neueste Nachrichten* (People's Party), over 100,000. There are a number of Communist journals, including, besides the *Berlin Rote Fahne*, papers in the following cities: Breslau, the *Arbeiterzeitung*, sale 15,000; Chemnitz, *Der Kämpfer*, 75,000; Bochum, the *Westfälische Arbeiter Zeitung*, 22,000; Essen, the *Ruhr Echo*, 47,000; Hamburg, the *Volkszeitung*, 25,000; Leipzig, the *Sächsische Arbeiterzeitung*, 30,000.

There are several newspapers which occupy a status and exercise an influence in German journalism and public life which cannot be measured by sales. The *Frankfurter Zeitung*, already mentioned, is perhaps the most powerful. It has 19 issues a week—morning and afternoon. Of a similar type is the *Kölnische Zeitung*, which was founded in 1848, and of which Bismarck once said that it was "worth an army corps on the Rhine"; and the *Hamburger Nachrichten*, founded in 1792. The *Jenaische Zeitung* has been in the same family since it was founded in 1674. A still older paper, the *Königsberger Hartungsche Zeitung*, dating from 1640, keeps its flag flying in the Eastern outpost on the Baltic. Papers published in districts which are inhabited by Germans, although not now under the German flag, are intensely Nationalist, such as the *Saarbrücker Zeitung*, papers in Polish Upper Silesia, Danzig and other territories formerly in the Empire.

In Germany, no general newspapers are published on Monday, except two or three in Berlin. Sunday is a day of rest to newspaper workers. The provincial morning papers in Germany issue three editions during the day, the contents varying more or less. In Berlin, two editions are issued. There are few afternoon papers in Germany.

The external form and arrangement of German newspapers is puzzling at first sight to an English reader. The outside sheet contains the editorial articles and news, while the middle of the paper is taken up by supplements which can be added to indefinitely. The quantity of extraneous matter, such as articles on literary, social and technical subjects, is enormous, and even the most serious political journals invariably publish a novel in serial form, as well as numerous novelettes and sketches. The local news in Berlin and other large cities is written with the minuteness and the familiarity of style of a village chronicle, and gives the impression that every one is occupied in observing the doings of his neighbour. The signed article is very much in vogue, and most writers and salaried correspondents have at least a cypher or initial by which they are distinguished.

According to the *Politischer Almanach* there are over 100 important newspapers in Germany, and 38 serious political journals, representing all shades of political opinion. There are 24 large news agencies in Berlin, with branches in the chief cities. All the political parties have their Press agencies.

Among the best-known German reviews are the *Preussische Jahrbücher*, *Deutsche Rundschau*, *Neue Rundschau*, *Deutsche Stimme*, *Süddeutsche Monatshefte* and the *Neue Zeit*. The *Reichsanzeiger* corresponds to the *London Gazette*.

Austria.—Austria with its diminished population, now between 6 and 7 million, has naturally many fewer newspapers than formerly, although the leading journals, such as the *Neue Freie Presse* and the *Neues Wiener Journal*, circulate amongst the German-speaking population throughout the territory of the old Austro-Hungarian monarchy. Vienna has a vigorous local press representing all political parties, including the Communists. There is freedom of the press in Austria.

Hungary.—With regard to Hungary the position is different. Hungary has now a population of 8 million, but journals in the Magyar language do not circulate outside the diminished area of Hungary, as the authorities in the Succession States prohibit

them. This restriction has had an unfortunate effect on Hungarian journalism. There are still ten daily newspapers in Budapest, but very few in the provinces, and it is stated that not more than three newspapers in Budapest, owing to the restriction of the area of circulation, are now commercial successes. The *Pester Lloyd*, published in German in Budapest, is a newspaper of international reputation and celebrated its 70th anniversary in 1928. Papers published in the Magyar language to serve the Hungarian minorities in Czechoslovakia, Rumania and Yugoslavia have a precarious existence. The most widely-circulated newspaper in Budapest is the *Pesti Hirlap*, which is followed by the *Az Est*. The other best known Hungarian newspapers are the *Magyarország* (Hungary) and *Magyarság* (Hungarian People).

Czechoslovakia.—The newly-won freedom in Czechoslovakia led to a great increase in the number of newspapers. It is a country with many political parties, and each party has its organ. There are many daily papers in Prague and the other chief cities in the republic. Unfortunately while the constitution of Czechoslovakia guarantees freedom of the press, this provision is not observed. Ever since the republic was established there has been press censorship,—originally preventive, but latterly censorious, and in some cases it has taken the form of suppression. This action applies to newspapers in all languages—Slovak, German and Hungarian,—but as regards Czech it is applied only to Communist journals. A very close supervision of newspapers is exercised by the Ministry of Justice through the police; no reasons are given for suppressing newspapers, and no compensation paid for the loss incurred by the newspaper proprietors.

While the police suppress newspapers, the Government uses the press for its own propagandist purposes. Several papers may be regarded as the official organs of the different parties in power. The Czech Foreign Office has an organ in the German language, the *Prager Presse*, and weekly journals in French and English, while a number of newspapers in the Czech language may be regarded as official.

Italy.—Before the advent of Mussolini's Fascist regime, the Italian Press laws were based on a royal decree of 1848. In Italy now newspapers are only permitted to exist by favour of the Government. The independence of the press has almost disappeared under the Mussolini regime. In 1924 a decree was issued which made newspapers liable to suppression and editors to punishment if they published "tendencious news" which might embarrass the Government in foreign or domestic affairs. This policy developed so that by 1926 the freedom of the press in Italy had ceased to exist. Journalists' organizations are also under the control of the Government.

Where the press was not muzzled there was a forced change of proprietorship in harmony with Fascist policy. This was the case with the well-known *Corriere della Sera* of Milan, for some years the most powerful organ in Italy. The *Stampa* of Turin, although never strongly anti-Fascist, was tamed; the same fate overtook the influential journal in the south, the *Mattino* of Naples. The complexion of the best-known papers in Rome has been changed. The only journals which enjoy a certain restrained independence are the semi-official organs of the Vatican. A number of newspapers have ceased to exist, and the journalists' associations have been placed under the control of Government commissioners. There are fewer papers in proportion to the population in Italy than in any other country in Europe except Russia.

Russia.—Freedom of the press has been completely suppressed in Soviet Russia. In Tsarist Russia censorship was severe, but a measure of toleration existed. In Soviet Russia censorship is applied before the matter is printed, which has to be submitted to an official editorial board known as the Gosizdat. There is a further check on the publication of news and expression of opinion, as newspapers are only published under the auspices of the governing authorities and are thus practically all official organs.

In 1914 there were 17 dailies in the capital, some of them of international reputation, such as the *Novoe Vremya*, and the *Retch*, and five in Moscow. In 1910 there were 52 daily newspapers in Russia, of which 13 were in St. Petersburg (Leningrad), and four in Moscow, exclusive of papers in Finland and

Polish Russia. In 1926 almost all the press was concentrated in Moscow. There were 11 morning and evening papers in Moscow, but only two of any importance, the *Izvestia* and the *Pravda*. In Leningrad there were only two morning papers, the *Pravda* and the *Krasnaya Gazeta*. The number of daily newspapers in Russia in 1928 did not exceed twenty. Scope, it is claimed, is given to what are called "worker correspondents" in the industrial centres, and a feature is the widespread interest in "wall" newspapers. Some papers appeal technically and otherwise to the peasant class.

Belgium.—Belgium possesses a vigorous press, published in French and in Flemish. Although the chief Paris papers circulate all over Belgium, the Belgian press nevertheless enjoys a large sale, and the popular journals are highly prosperous. There are 17 daily papers published in Brussels and nine in Antwerp. There are several Socialist journals, the chief organ of the party being *Le Peuple*. The success of the Socialist press is due largely to its association with the co-operative movement. *La Libre Belgique*, which appeared regularly during the War in occupied Belgium in spite of the vigilance of the Germans, now exists as a daily newspaper. In Belgium, the press laws have not been changed for many years and the press enjoys almost unlimited freedom.

The Netherlands.—The Netherlands, with a population of over 7,000,000, possess a healthy press, including journals which enjoy a high reputation for their literary merits and as organs of opinion. The chief among these are the *Nieuwe Rotterdamsche Courant*, *De Telegraaf* and the *Algemeen Handelsblad*, of Amsterdam. There are eight daily papers in Amsterdam, seven in The Hague and five in Rotterdam, and these circulate throughout the country.

Spain and Portugal.—There is little progress to record in the Spanish press, and circulations are small. The illustrated *A.B.C.* is the most popular paper. The *Heraldo* and the *Liberal* are Madrid journals. *El Sol* was founded in 1917 by the Spanish Paper Trust. There are 20 daily papers in Madrid and 17 in Barcelona, and about 200 dailies of sorts in Spain. The principal Portuguese papers are the *Diário Notícia* (founded 1820) and the *Jornal do Commercio*, both published in Lisbon.

Switzerland.—Switzerland, owing perhaps to its small population, has few papers known outside the country. In 1926 there were 38 daily newspapers published in German, 19 in French and two in Italian. The best known are the *Journal de Genève*, read in France, the *Neue Zürcher Zeitung* and the *Zürcher Post*, which have a considerable circulation in Germany. (R. DON.)

IV. UNITED STATES

Among the professional writers of news-letters towards the close of the reign of Elizabeth and the beginning of that of James I., to whom reference has already been made in the discussion of the cradle days of English journalism the three most important were John Chamberlain, Thomas Locke and John Pory. The last of these three, when he was secretary of the Virginia Colony, sent news letters from "James Citty" as early as 1619 to his "good and gracious lord" in London for whom he had previously worked as a professional correspondent. The evolution of the newspaper in the United States, therefore, technically starts with John Pory. But he was not the only writer of news-letters. John Campbell, postmaster at Boston, wrote with some degree of regularity letters of news to the various colonial governors in New England. Later he printed his news-letters and thus established, in April 1704, the first American newspaper—*The Boston News-Letter*. As in other countries there had been stray sheets of news printed at various times, so in this country. Mention may be made of *The Present State of the New-English Affairs* (1689) and *Publick Occurrences* (1690). Both of these sheets were printed in Boston and the latter, brought out by Benjamin Harris, might technically be called a newspaper except for the fact that it had only one issue. Regularity in publication and continuity in the news are demanded by the term newspaper. Harris intended regularity of publication but because his sheet was thought to contain "reflections of a very high nature" it was suppressed by local authorities. Before the close of the century its publisher

returned to England to become the publisher of *The London Post*.

Colonial Period.—Mortality of pioneer papers in the United States has been usually high. But *The Boston News-Letter* under various publishers survived until the declaration of independence by the 13 original Colonies. The honour of being the second newspaper is practically divided between *The Boston Gazette* (Dec. 1719), started by William Brooker when he succeeded Campbell as postmaster of Boston, and *The American Weekly Mercury* (Dec. 1719), brought out by Andrew Bradford, the local postmaster in Philadelphia. While technically there was a difference of one day, both papers are said to have been mailed to subscribers on the same day. The fourth paper, *The New England Courant*, started in Boston by James Franklin in Aug. 1721, was a flaming organ of dissent carried on by a group of contributors called by the Rev. Increase Mather "the Hell-Fire club." So radical was it in expression of opinion that an order was issued that James Franklin no longer print the newspaper. The situation was met by having a younger brother, Benjamin, become the publisher in name if not in fact. After a quarrel between the two brothers, Benjamin went to Philadelphia where he later purchased (1729) an interest in *The Pennsylvania Gazette*, started by Samuel Keimer (Dec. 1728). Franklin made this paper one of the most influential of all those that appeared in the colonial period. New York did not have a paper until Nov. 1725, when William Bradford started *The New York Gazette*. As "Printer to the Crown," Bradford was unable to record opposition to government measures and in this way provided for the appearance in Nov. 1733 of *The New York Weekly Journal*. The latter paper, nominally published by John P. Zenger, was really edited by the leaders of the opposition. Freedom in expression of popular rights brought a famous libel suit against Zenger that did much to establish the freedom of the press in America. The jury, in freeing Zenger, decided that it had the sole right to judge both the law and the facts and reversed the old tradition, "The greater the truth the greater the libel."

The first newspaper in the ten remaining Colonies of the original 13 was a gazette with the name of the Colony before it, with the single exception of *The Wilmington Chronicle* (1762) in Delaware. These gazettes appeared as follows: Annapolis, Maryland (1727); Charleston, South Carolina (1732); Newport, Rhode Island (1732); Williamsburg, Virginia (1736); New Haven, Connecticut (1755); New Bern, North Carolina (1755); Portsmouth, New Hampshire (1756); Wilmington, Delaware (1762); Savannah, Georgia (1763); and Burlington, New Jersey (1777). These pioneer papers were important because in their plants were trained the printers who went forth to establish others, either in the 13 original Colonies or along the frontier farther west. Colonial printers, often forced to accept wheat, wood, butter, corn, etc., in payment for subscriptions, continually faced censors who, clothed by the law with authority, annoyed publishers bold enough to print the critical debate going on in the community. Setting aside a little corner for original poetry and opening their columns to letters from contributors who furnished essays, they provided a means of literary expression that contributed no small part to the founding of American letters. Of the papers of this period special mention should be made of *The Boston Gazette* (1755), the third paper of that name in Boston and distinguished from the other two as being the "pet of the patriots." Among those who contributed to its columns were such political leaders as Samuel Adams, Joseph Warren, Thomas Cushing, etc. *The Massachusetts Spy* (1770), published first at Boston and then at Worcester, Mass., was a dynamic force under the able editorship of Isaiah Thomas, famous for his history of printing. Toward the close of the colonial period *The Pennsylvania Journal* (1742), under the editorship of William Bradford III., disputed supremacy in Philadelphia with Franklin's *Gazette*.

Early Political Organs.—After independence from Great Britain had been secured, papers became political organs of which *The Gazette of the United States* (1789), edited by John Fenno, and *The National Gazette* (1791), edited by Philip Freneau, were possibly the most important because the former was really controlled by Alexander Hamilton, the leader of the Federal Party,

and the latter by Thomas Jefferson, the leader of the then Republican Party—now the Democratic. So vitriolic and so vituperative were the papers that the era is known as one of black journalism. So bitter, for example, was the fight between the two *Gazettes* already mentioned that Washington had to request his two secretaries to put a stop to their bickerings in the interests of the struggling republic. Politics so promoted publication of papers that the number increased from 37 in 1776 to 359 in 1810.

Dailies.—As the cities on the Atlantic coast increased in size their papers began to appear more frequently: first semi-weekly, later tri-weekly and finally daily except Sunday. The first daily newspaper was an outgrowth of such a tri-weekly—*The Pennsylvania Packet and General Advertiser* which first appeared in Philadelphia in Sept. 1784. Just as the colonial weekly adopted *Gazette* as a part of its title so the daily seized upon the word *Advertiser*. The second daily, the outgrowth of a semi-weekly at Charleston, S.C., first appeared in Dec. 1784. New York city did not have a daily until March 1785, when Francis Childs started *The New York Daily Advertiser*. The New York daily beginning an independent existence faced a more difficult struggle to secure financial support both in circulation and in advertising. From the start the daily paper was more of an advertising sheet than it was a purveyor of news. Such news as was inserted was chiefly of a commercial character, such as the arrival and departure of vessels, quotations on produce, the transactions in real estate, etc. The paper itself went to the counting room instead of to the home. The oldest daily newspaper in the United States without change in name and with continuous publication is (1929) *The New York Evening Post* (Nov. 1801) which started as a Hamiltonian organ under the editorship of William Coleman. The oldest newspaper that has appeared regularly without suspension since its establishment is *The Hartford Courant* which began as *The Connecticut Courant* (Oct. 1764)—a weekly which did not become a daily until long after *The New York Evening Post* was started. Two men of letters are associated with these two papers: Charles Dudley Warner with *The Courant* and William Cullen Bryant with *The Post*. By 1812 New York had seven dailies but not one of them exceeded 2,000 in circulation.

News Gathering.—The weekly and daily newspapers in the United States showed nothing of that enterprise so characteristic of American journalism until Henry Ingram Blake, employed on *The Palladium* of Boston, stopped waiting for news to come to the office and went out in person after such items. At first he went to the coffee houses for such accounts of foreign events as sea captains might bring there. Still later he had his own skiff and rode out to meet incoming vessels to get the news. From this modest beginning came many innovations to facilitate quick publication. In New York the little rowboat soon gave way to the fast clipper ship owned and chartered by a newspaper. *The Journal of Commerce* (Sept. 1827), founded as a semi-religious newspaper by Arthur Tappan, not only had the fastest ships but even built a semaphore at Sandy Hook to relay the news from its own boat to Staten Island from which it was taken promptly to the publication office. In gathering the news on land *The Baltimore Sun* (May 1837), co-operating with other papers, established a pony express to facilitate the collection of news. But the American who really put the news in the newspaper was Prof. Samuel F. B. Morse of New York university, the inventor of the telegraph, who stretched a wire directly from news centres straight to the newspaper office. But other wires soon came through leases directly under the control of such organizations as the Associated Press, the United Press, etc. (q.v.).

While better facilities for collecting news were going on, the mulepack, the dugout and the prairie schooner were carrying presses and types farther and farther west to establish *The Kentucky Gazette* (1787) at Lexington; *The Mississippi Gazette* (1800) at Natchez; *The Indiana Gazette* (1804) at Vincennes; *The Missouri Gazette* (1808) at St. Louis; *The Arkansas Gazette* (1819) at Port Arkansas; *The Texas Gazette* (1820) at San Felipe—to mention the gazettes that were the first papers in various States. Among the last to have newspapers were Minnesota, *The Pioneer* (1849) at St. Paul; Utah, *The Desert News*

(1850), at Salt Lake; Colorado, *The Rocky Mountain News* (1859), at Denver; Wyoming, *The Leader* (1867), at Cheyenne; and North Dakota, the latest with its newspaper, *The Tribune* (1873), at Bismarck.

The Penny Press.—The daily newspapers which immediately followed the pioneers in this field soon developed to such size that they came to be called blanket sheets. Commercial in character, they had only limited circulation and usually sold at six cents per copy. For \$30 a year a business man might not only have the paper for himself but also a square of advertising for his business. Early in the second quarter of the 19th century a new type of daily appeared, cheaper in price and smaller in size—the so-called penny press. The forerunner of this new journalism was *The Daily Evening Transcript* which Lynde M. Walter began in Boston, July 24, 1830, at the low subscription price of four dollars per annum. While the first daily to sell for a penny was *The Cent* (1830) started by Dr. Christopher Columbus Conwell, the first successful publisher and therefore the founder of penny journalism was Benjamin H. Day, whose *Sun* first rose in New York, Sept. 3, 1833, although Horace Greeley had made an unsuccessful attempt the first of the same year in New York to market *The Morning Post* at two cents. *The Sun* immediately met with remarkable success because it gave in condensed form to the mechanics and to the servant girls the tittle-tattle and the backstair gossip of the city; it gave more attention to the assault and battery cases of the police courts than to the attacks of President Jackson on the U.S. Bank. But *The Sun* was soon followed by other penny dailies not only in New York but also in other important cities, such as Philadelphia, Baltimore, Boston, etc. Similar both in size and in subject matter to *The Sun*, they were called penny trash by the sixpenny sheets. The latter in turn were spoken of by the penny papers as "our bedquilt contemporaries." A bitter war arose between the two types of dailies, but it was the penny press that met with popular favour and prospered financially, because it contained the heart throb and the human interest. In all its columns it stressed not what was important but what was interesting. Not until Charles Anderson Dana purchased *The Sun* in 1868 did that paper change its character and become one with a class appeal under his editorship.

Bennett and Greeley.—Possibly the man who most influenced American journalism at this period was James Gordon Bennett, who with \$500, two wooden chairs and an old dry-goods box began *The New York Herald* in a cellar on May 6, 1835. Bennett was editor, publisher, advertising director, circulation manager and everything else down to the printer's devil. He reported the proceedings of the police court with a freedom that shocked his sixpenny contemporaries and soon found that scandal sold papers on the streets. To him nothing was sacred, not even the church or his own personal affairs. Often assaulted on the street, he reported the affair in his own paper in detail and announced his own engagement in what is considered one of the most interesting specimens of newspaper literature. Though full of malicious squibs and furious diatribes, *The Herald* was in some other respects conducted with remarkable skill and enterprise in being the first to print the news. To his son of the same name Bennett left one of the greatest money-making newspapers in the history of American journalism. The son continued many of the father's policies, but on a larger scale. Expense was not considered when he sent Stanley to Africa to find Livingstone and fitted out an Arctic expedition that had a most unfortunate outcome. In case of distress in any particular country he was among the first through his *Herald* to start a subscription campaign. He began that for the relief of the suffering in Ireland with a gift from *The Herald* of \$100,000. Often regarded as eccentric and peculiar, he exerted a tremendous influence upon American journalism because of the emphasis which he placed upon international news without neglecting that which was local in character. He also set the style in the mode of treatment of news and in many ways established the yardstick by which it is measured.

After the arrival of the penny press there came many changes in the manufacture and in the marketing of newspapers. To secure speed in production Robert Hoe took the type from a flat bed

and put it on a revolving cylinder turned by steam. News boys, in addition to distributing papers among regular patrons, were given additional copies to sell in the streets. The printing of larger and larger editions brought many improvements in the manufacture of both presses and paper. The introduction of compulsory education contributed to an interest in the news.

Though starting as a penny paper in April 1841, as a Whig organ, *The New York Tribune* began its second volume in April 1842, at two cents a copy. Horace Greeley, one of the most picturesque figures in American journalism, was its editor and one of its proprietors down to shortly before his death after his defeat in 1872 for the presidency. Upon the completion of its 20th year (1861) it announced its circulation as 287,000. But this figure included both the daily and the weekly: the former was later given as slightly in excess of 55,000. In the same year *The Herald* had a daily distribution of over 75,000 copies—possibly the largest at that time in the world and about 25,000 in excess of *The Times* of London. The circulation of *The Sun* was about midway between that of *The Herald* and that of *The Tribune*, while *The Evening Post*, which from the start had addressed itself to a more cultured audience, had only 18,000. Greeley made his paper not only an organ of Whig politics, but also a purveyor of novel and new ideas in both social and political economy. Among the editorial contributors in the latter field was Albert Brisbane, father of Arthur Brisbane of the present day. In the Franco-Prussian war, *The Tribune* achieved considerable fame through the publication of dispatches sent by cable at enormous expense. In a way *The Tribune* was a sort of school of journalism in which the following distinguished journalists and publicists received their first training: Henry Jarvis Raymond, Charles Anderson Dana, George William Curtis, Carl Schurz, John Hay, Whitelaw Reid, Henry James, William Dean Howells, Bayard Taylor, George Ripley, Margaret Fuller, Edmund Clarence Stedman, Richard Grant White, Richard Hildreth, John Russell Young and Sidney Howard Gay—all of whom later held important positions in New York journalism.

The Times and The World.—The final success of *The Tribune* led Henry Jarvis Raymond to establish *The New York Times* on Sept. 18, 1851, but under different conditions than existed when Bennett started *The Herald*. For a mechanical equipment Raymond had to pay at least \$50,000 and to his assistants he had to give much larger salaries than he received when he worked for Greeley. Over \$100,000 was spent before the paper showed a profit. It was after Raymond's death, however, that *The Times* came into great prominence through its bold exposure of the robberies and frauds committed by the Tweed ring in the municipal government of New York.

In the three decades that followed the establishment of the penny press of New York some 30 daily newspapers were established but their names must remain blank except for one, which has had a most remarkable history, *The New York World*. Started as a religious daily newspaper on June 1, 1860, it was published at a heavy loss until a year later, when it merged with the *Courier-Enquirer*, practically defunct, though at one time, under the ownership of James Watson Webb, a powerful political organ. As a worldly *World* it passed through various ownerships until its purchase (May 1883) by Joseph Pulitzer, the penniless son of a Jewish father and a Catholic mother, who coming to America from Hungary in 1864, was already the owner of *The St. Louis Post Dispatch*. Under his control he transformed *The World* to one of the most fearless, dynamic campaign sheets in the United States. The Civil War brought about an increase in subscription price. In the North the customary price for a sheet of eight or more pages was four cents and farther west five cents. In the South newspapers sold much higher, were reduced in size and even in rare instances appeared printed on wallpaper. The daily demand for news brought forth the Sunday newspaper as that term is now understood.

Personalities in American Journalism.—Until several decades after the Civil War, newspapers not only in New York but in other large cities were closely associated with the names of those responsible for their management. In Springfield, Mass.,

Samuel Bowles was the personification of *The Republican* which his father, with the help of a small hand press, had started on Sept. 8, 1824, and which 20 years later, became a daily. In Philadelphia, *The Record*, started as a one cent daily (June 1877), was the outgrowth of *The Public Record*, founded seven years earlier: the latter paper was a losing venture until William M. Singler purchased its Associated Press franchise for his new paper. *The Evening Bulletin*, founded in 1847 by Alexander Cummings, had a vicarious existence until it became the property of William L. McLean. The first number of *The News* appeared in Indianapolis, Ind., on Dec. 7, 1869. *The Evening Star*, which first shone in Washington, Dec. 16, 1852, has had a growth contemporaneous with that of the city in which it is published. Its contemporary, *The Post*, was established in the U.S. capital, Dec. 1877, by Stilson Hutchins. *The San Francisco Chronicle* was begun June 1865, by Charles de Young, as a playbill distributed free in theatres and in other places. On March 4, 1887, U.S. Senator George Hearst turned *The San Francisco Examiner*, which he had taken as a part of a bad debt, over to his son William Randolph Hearst, who used it as a starter for a famous chain of papers stretching across the country from San Francisco to New York. In Detroit, in Aug. 1873, James E. Scripps started his *Evening News* which became a rival of *The Free Press* (1831). Milwaukee saw *The Sentinel* established in June 1837, and *The Evening Wisconsin* in June 1847. Louisville, Ky., witnessed (Nov. 1830) the first appearance of *The Journal* under the editorship of George D. Prentice and had laid at its doorstep in Nov. 1868 a united sheet—*The Courier-Journal*, controlled by Col. Henry Watterson. In Chicago passing mention may be made that *The Daily News*, which made its first appearance in Dec. 1875, was started by Melville E. Stone, who later achieved distinction as general manager of the Associated Press; that *The Herald* first appeared March 1881; that *The Tribune*, the first edition of which (June 1847) was 400 copies printed on a hand press, passed, in 1855, into the control of Joseph Medill, whose editorials rivalled those of Horace Greeley. William Rockhill Nelson, a most picturesque figure among the makers of American newspapers, first let his *Star* shine in Kansas City, Mo., Sept. 1880, and Harrison Gray Otis, that dynamic editor, became owner, on Aug. 1, 1882, of *The Los Angeles Times*, a paper then only a year old. To supplement what has been written about the press in Boston, it may be added that *The Post* was started as a Democratic daily on Nov. 9, 1831, but only became a power in Boston journalism when it was purchased by E. A. Grozier, a protégé of Joseph Pulitzer; that *The Herald* came into existence on the afternoon of Aug. 31, 1846, with an edition of 2,000; that *The Globe* was started March 1872, to grace the breakfast table just as *The Transcript* adorned the tea table, and that its builder was Charles H. Taylor, who joined its staff in August of that year.

A catalogue of papers and their editors during the period when personalities were closely linked with papers would resemble the catalogue of ships in Homer's *Iliad* and would make about as interesting reading. But mention must in justice be made of Murat Halstead, of *The Commercial Gazette*, John R. McLean, of *The Inquirer* and Charles P. Taft, of *The Times-Star* in Cincinnati, Ohio; Edwin Cowles, of *The Leader*, William W. Armstrong and L. E. Holden, of *The Plain Dealer*, in Cleveland, Ohio; General J. M. Comley, of *The Commercial Telegram*, in Toledo, Ohio; W. D. Bickham, of *The Journal*, in Dayton, Ohio; J. S. Clarkson, of *The Register*, and John Watts, of *The Leader*, in Des Moines, Iowa; John Arkins, of *The Rocky Mountain News*, in Denver, Colorado; A. H. Belo, of *The News*, in Galveston, Texas; John H. Holliday, of *The News*, John C. New, of *The Journal*, and W. J. Craig, of *The Sentinel*, in Indianapolis, Indiana; J. M. Keating, of *The Appeal*, in Memphis, Tennessee; W. E. Haskell, of *The Tribune*, and J. S. McLain, of *The Journal*, in Minneapolis, Minnesota; A. S. Colyar, of *The American*, in Nashville, Tennessee; H. L. Pittock, of *The Oregonian*, in Portland, Oregon; O. H. Rothaker, of *The Republican*, in Omaha, Nebraska; William Hyde, of *The Republic*, and Joseph B. McCullagh, of *The Globe-Democrat*, in St. Louis, Missouri; J. A. Wheelock, of *The Pioneer-Press* and Lewis Baker, of *The Globe*, in St. Paul,

Minnesota. Sins of omission, if any, may be pardoned, for journalism in the United States, unlike that of England which revolves around London, has many centres in America.

To pass from personalities to statistics, it should be said that figures relating to journalism in the United States until after the census of 1880 are open to question; but the reports of the census for 1850, 1860, 1870 and 1880 still remain, however, the most authoritative information as to the increase in the number of newspapers. According to their tables there were in the United States 254 dailies in 1850, 387 in 1860, 574 in 1870, 971 in 1880; 31 semi-weeklies in 1850, 79 in 1860, 115 in 1870, 133 in 1880; 1,902 weeklies in 1850, 3,173 in 1860, 4,295 in 1870, 8,633 in 1880. Of all these classes, there were in 1850, 2,526; in 1860, 4,051; in 1870, 5,871; in 1880, 11,314.

Yellow Journalism.—Around 1880 the more important daily newspapers underwent great economic change as the result of small stores consolidating into huge department stores which took liberal space in the papers to advertise their so-called bargains. As store and other display advertising increased in amount, newspapers were continually forced to increase their size. This increase was possible without raising subscription rates because of the substitution of wood pulp paper for rag and a constant lowering in the price of the pulp stock. The newspaper became, consequently, a complicated economic product with two things for sale: to the reader it sold news, editorials and other interesting reading matter; to the advertiser it offered white space at so much per inch. Complications came from the fact that these two joint products had to be marketed in the same container—the white paper on which the news was printed and on which the advertising was displayed. More and more the advertiser paid the heavier burden in the cost of production. Because advertising rates were based on the number of papers distributed, there resulted a wild race for circulation. The rural weeklies remained about the same but the city dailies underwent a social change. In small communities where the editor knows personally many of his subscribers, the paper is forced to omit news that is unkindly or reflects upon the character of prominent citizens and to leave such news to circulate by word of mouth. In the larger cities where the next door neighbour is practically a stranger, exciting and emotional news does not circulate by gossip and the paper that prints it sells well on the streets. Recognition of this fact caused a wave of sensational—sometimes called yellow—journalism to sweep over the United States. Bennett had earlier discovered this fact but it remained for Joseph Pulitzer and William Randolph Hearst to run a race to see which could carry sensational journalism to its extreme. Hearst, who already owned *The San Francisco Examiner*, coming to New York in 1896, purchased *The New York Journal* which had been started by Albert, a brother of Joseph Pulitzer. According to the gossip of Park Row, the Fleet street of New York, Hearst "broke into New York with all the discreet secrecy of a wooden legged burglar having a fit on a tin roof." He brought with him the circulation schemes which he had found successful for his *Examiner* in San Francisco, and adopted many new ones furnished to him by newspaper men whom he won over from Pulitzer through larger salaries. He later called the morning edition of *The Journal*, *The American*, a favourite name with him for other papers of his chain, and in charge of *The Evening Journal* he placed Arthur Brisbane who by still more sensational methods rapidly advanced the circulation of the latter paper. The result of the Hearst influence was a change in character of news content for many papers and a more spectacular display of headlines that stretched across the page.

Welfare Activities.—In striking contrast with the sensational activities of certain newspapers was the adoption of extramural activities by the press in the interests of the public welfare. Among the earliest of these was the movement of *The New York Herald*, begun on May 29, 1892, to furnish free ice for the relief of mothers and babies in the tenement house districts of New York. Somewhat similar was the Fresh Air Fund, started by *The New York Evening Post* but later taken over by *The New York Tribune*, to provide outings for city children in homes and camps supported by the fund and in private homes offering to

receive the children of the poor for periods ranging from one to two weeks. In Pittsburgh, Pa., *The Press* raised \$40,000 with which to build a home for newsboys. In Chicago, *The Tribune* started two reforms that developed into national movements: one, a campaign for a "Sane Fourth of July"; and the other, a "Good Fellow Club" which aimed to give the children of the poor more than a bowing acquaintance with Santa Claus at Christmas time. *The News* of Indianapolis, Indiana, went out into the country and erected a Fresh Air village for the benefit of sick women and children. In San Francisco, *The Examiner* built the Little Jim Hospital for Incurables and the Free Eye and Ear infirmary for the treatment of unfortunate poor children. The One Hundred Neediest Cases of *The New York Times* was designed to relieve just that number but each year has seen a substantial increase in the number of persons helped. *The New York World*, to use another example, started a movement to supply radio without cost to "shut-ins." Smaller papers throughout the United States have followed the examples set by metropolitan dailies in this matter of service and aid to the community.

Practically simultaneous with the arrival of Hearst in New York was that of Adolph S. Ochs who assumed control of *The New York Times*, Aug. 1896. In spite of a proud past, *The Times* for various reasons had lost in circulation until it reached below 10,000 and its mechanical equipment had so deteriorated that it was only worth what it would bring for junk. Reorganized on a sound financial basis by Mr. Ochs, *The Times* quietly and unostentatiously began its campaign of appeal to thoughtful readers under a slogan, "All the News That's Fit to Print." Slowly but surely *The Times* gained momentum until its growth constituted an outstanding chapter in the annals of American journalism. Its remarkable achievements in reporting so fully the news of the World War were simply the culmination of a far-seeing campaign that had progressed steadily under the management of Mr. Ochs who, disclaiming all glory for personal achievement, says that his paper is simply a vindication of his judgment of newspaper readers in New York.

Consolidations.—But since 1900 the trend in journalism in the United States has been towards consolidations and extensions of chain newspapers. Those under publishers like Ochs of *The Times*, Nelson of *The Kansas City Star*, Lawson of *The Chicago Daily News*, etc., were simply the exceptions to the general tendency. Space does not permit mention of the amalgamations of smaller papers but some of the more important changes in metropolitan fields may be noted. Frank A. Munsey was sometimes called a dealer in dailies. In 1891 he purchased *The New York Star*, a daily established on Sept. 22, 1825, and on Feb. 1, 1891, changing the name of his paper he gave New York its first tabloid, *The Daily Continent*, which though it attracted favourable attention was not successful financially and so was discontinued on June 30. Before his death in 1925 he merged *The Press* with *The Sun* in 1916. Later, in 1920, he purchased *The New York Herald* and *The Evening Telegram*. Discontinuing *The Morning Sun*, he transferred that title to *The Evening Sun* with which, in 1923, he merged *The Globe*, then the oldest newspaper in New York city as it had been established Dec. 9, 1793, as *The Minerva*, under the editorship of Noah Webster, the lexicographer. At about the same time Munsey purchased *The Evening Mail* with which he consolidated *The Evening Telegram*. He then sold (1924) *The Herald* to *The New York Tribune*, now published under a joint title. In Boston *The Herald* (morning) took over (1912) *The Traveler* (evening) and continued it as its evening edition. Later (1917) *The Herald* absorbed *The Journal* (morning). In Kansas City W. S. Dickey bought (1921) *The Journal* (morning) and (1922) *The Post* (evening). He continued *The Journal* as a morning paper and *The Post* as an afternoon, with joint publication on Sunday, with a flat subscription price for both papers. In this he followed the example of *The Star* which since 1901 has been printing *The Times* as its morning issue, with both papers going to the same subscribers.

In Philadelphia Cyrus H. K. Curtis became on Jan. 1, 1913, the publisher of *The Public Ledger* which he purchased from Adolph S. Ochs. On Sept. 14, 1914, he started *The Evening Pub-*

lic Ledger with which he united (1918) *The Evening Telegraph*. In 1920 he purchased *The Press* to unite with *The Public Ledger* and in 1925 he did the same with *The Philadelphia North American*. In Chicago *The Record-Herald* purchased (1913) *The Inter-Ocean* and appeared as *The Herald* which later was purchased by W. R. Hearst and united with his Chicago *Examiner*. In Cleveland *The Plain Dealer* absorbed *The Leader* and in St. Louis *The Globe-Democrat* purchased *The Republic*, one of the oldest daily papers in Missouri.

Important Chain Groups.—Of the group-owned newspapers in the United States in 1928 the Hearst chain is the most important, both in number and in influence. His group includes *New York American*, *New York Journal*, *Boston Advertiser*, *Boston American*, *Chicago Herald & Examiner*, *Chicago American*, *San Francisco Examiner*, *San Francisco Call*, *Los Angeles Examiner*, *Los Angeles Herald*, *Seattle Post-Intelligencer*, *Atlanta Georgian-American*, *Oakland Post-Enquirer*, *Washington Herald*, *Washington Times*, *Baltimore American*, *Baltimore News*, *Milwaukee Sentinel*, *Albany Times-Union*, *San Antonio Light*, *Detroit Times*, *Rochester Journal*, *Syracuse Journal*, *Milwaukee News* and *Pittsburgh Sun-Telegraph*. Next in importance is the chain known as the Scripps-Howard string which consists of *New York Telegram*, *Cleveland Press*, *Pittsburgh Press*, *Cincinnati Post*, *Columbus Citizen*, *Baltimore Post*, *San Francisco News*, *Washington News*, *Indianapolis Times*, *Oklahoma City News*, *Toledo News-Bee*, *Knoxville News-Sentinel*, *Terre Haute Post*, *San Diego Sun*, *Covington Kentucky Post*, *Akron Times-Press*, *Birmingham Post*, *Memphis Press-Scimitar*, *Houston Press*, *Youngstown Telegram*, *Fort Worth Press*, *Denver Rocky Mountain News*, *Denver Evening News*, *Evansville Press*, *El Paso Post*, *Albuquerque New Mexico State Tribune*. The Scripps-Howard plan of organization, while providing for central control through stock ownership, does permit executives on individual papers to have substantial stock in the enterprise. The Frank E. Gannett group, which originally consisted of dailies in New York State outside the metropolitan area, has branched out to include, for example, *The Times of Hartford*, Conn. The James M. Cox group of papers in Ohio has been increased by *The News of Miami*, Florida. The Paul Bloch group, more highly scattered, added *The Brooklyn Standard-Union* in 1928. The tendency already noticed has been an increase not only in the number of strings but also a lengthening of the string. Adolph S. Ochs, since his sale of *The Philadelphia Public Ledger* to Cyrus H. K. Curtis, has been content with the ownership of his *Times* in New York and his *Times* in Chattanooga. Curtis, on the other hand, entered the New York field with the purchase of *The Evening Post*.

Mutualization Movements.—Another recent current in American journalism should not be overlooked—the passing of the control of important newspapers into the hands of those who edit and make them. In Chicago after the death of Victor A. Lawson, *The Daily News* passed into the control of Walter A. Strong and other executives of that paper through the assistance of a number of prominent citizens. In the same way *The Star* in Kansas City went to a group who had been associated with Nelson. In New York city William T. Dewart carried out the wishes of Frank A. Munsey and developed a mutualization plan by which employees shared in the profits. In Dallas, Texas, *The Morning News* and *The Evening Journal* passed into the control of George B. Dealey and other employees.

Tabloids.—Since 1925 critical articles have appeared in American magazines that, in political language, viewed with alarm the consolidations and amalgamations, the extensive use of syndicated material such as comic strips, the growth of standardization in the presentation of the news, as well as a lack of initiative in the gathering of news independent of the Associated Press, the United Press, etc. The introduction of tabloids may be explained, in part, by the passing remark of Lord Northcliffe, "If some American does not start one I shall have to come over to do it." The first in the field was *The Illustrated Daily News*, established in New York city, June 1919, by *The Chicago Tribune*. At the close of 1927 it had the largest circulation of any American newspaper, over a million copies daily. Its success doubtless led W. R. Hearst

to establish *The Mirror* and make over his *Boston Advertiser* (est. 1813) into a tabloid. The third tabloid in New York was *The Graphic* (1924). Within the ranks, *The Christian Science Monitor* of Boston (Nov. 1908) has possibly been the most caustic critic of questionable standards and unethical tendencies in journalism.

Circulation Statistics.—Statistics make dull reading but some are necessary for the sake of completeness. At the close of 1927, the latest year for which figures are available, there were in the United States about 200 daily newspapers which might be called of the first rank, 2,000 daily newspapers all told and 20,000 rural or community weeklies. Morning dailies at the end of that year totalled 411, evening 1,538, Sunday papers 526. The total morning paper circulation averaged 14,145,823 a day, while the total evening paper circulation averaged 23,820,933 copies daily. The average Sunday circulation was 25,469,037. The amount of white paper consumed that year approximated 3,750,000 tons. For a metropolitan newspaper of the first rank the figures of *The New York Times* may be used. That paper for 1927 had a gross income of \$27,424,829.55; it paid out weekly to employees \$154,246.98; it consumed during the year 99,633.4 tons of paper; and used 4,491,593 lb. of ink. Its employees were distributed as follows: the editorial and news departments 525, business office 850, mechanical 1,869, executive 75—total 3,319. It paid out for welfare activities, such as pensions, sick benefits, etc., \$352,000. Pages printed during the year totalled 13,526,481,200. The average number of pages in a daily issue was 46.3 and that for Sunday 225.6. To visualize these figures it may be said that if all the printed matter, including advertisements and illustrations of an entire Sunday edition of *The Times*, could be pasted on a ribbon a column wide this ribbon would circle the globe more than 12 times. On the advertising side, *The Times* in 1927 published 29,710,606 agate lines.

In the pioneer days of journalism in the United States the newspaper was an educational influence somewhat primary in character as a sign often posted in public taverns proved—"Persons learning to read will please use last week's *Gazette*." To-day the American newspaper with an intelligent editorial page, with special articles worthy of place in the monthly review, with a book and dramatic department that is free from advertising puffs, with a wordless editorial in the shape of a cartoon, with a news department that can distinguish between news that has permanent value from that which has only passing interest, is a sort of liberal education for its readers—commercial as it often is in character because of economic and social pressure it cannot control.

BIBLIOGRAPHY.—Histories of individual newspapers include: E. Davis, *History of the New York Times, 1851-1921* (1921); J. L. Heaton, *The Story of a Page* (N.Y. World) (1913); F. M. O'Brien, *The Story of the New York Sun 1833-1918* (1918); A. Nevins, *The Evening Post* (New York, 1922); J. M. Lee, *The New York Globe*; and R. Hooker, *The Story of an Independent Newspaper* (Springfield Republican, 1924). Among the books on newspaper editing and making are: G. C. Bastian, *Editing the Day's News*; W. G. Bleyer, *Newspaper Writing and Editing* (1923); J. Rogers, *Newspaper Building* (1918); N. J. Radder, *Newspaper Makeup and Headlines* (1924); M. L. Spencer, *News Writing* (1917); O. G. Villard, *Some Newspapers and Newspaper Men*, offers a critical survey of some of the leading American newspapers; L. N. Flint, *The Conscience of the Newspaper* (1925), and N. A. Crawford, *Ethics of Journalism*, make notable contributions to the field of ethics. *The New York Times* publishes in book form a quarterly index for that newspaper in particular and others in general. C. L. Canon, *Journalism—A List of References in English*, lists both books and magazine articles relating to journalism. J. M. Lee, *Instruction in Journalism in Institutions of Higher Education* (U.S. Dept. of Education, 1918), traces the development of such instruction since the first school of journalism was established at the University of Missouri in 1909.

V. LATIN AMERICA.

To South America, rather than to its sister continent, belongs the honour of printing and circulating the first printed news sheets of the Western Hemisphere. Not only in contents but also in mechanical form they necessarily followed somewhat closely the style set by the journals of southern Europe.

Early News Sheets.—The first printed sheet of news to appear in South America was issued in 1594 at Lima, Peru, and de-

scribed the capture, off the Peruvian coast, of Richard Hawkins, the free-booter, and of his ship, "The Dainty." Like the earlier sheets of continental Europe, this *Relación* had a long descriptive title. But it was not until 1620 that one meets printed sheets dealing with more than one item of news. After that year their occasional appearance gives the title, Father of South American Journalism, to their printer, Jerónimo de Contreras, who had come to Lima from Seville, Spain. In 1641 José de Contreras succeeded his father as head of the printing house which remained in the family until about the beginning of the second quarter of the 18th century. The most successful of this family of printers was the grandson, José, who obtained the appointment of royal printer to the Spanish Crown in the colonies, and who gave special attention to the editing of news sheets which appeared with approximate regularity of about one a month.

After 1640, *Diario* was commonly used as a title of news sheets, although *La Relación* and *Noticia* appeared. For the most part, these news sheets from the Contreras's press consisted of four pages in small type. *Diario* was especially appropriate as the news was frequently printed in the form of a diary—day by day. After the press of de Contreras had suspended, there was a cessation of news sheets of regular publication. In 1744 there appeared, however, a newspaper with a definite title with consecutive numbers for successive issues. The first issue of this new paper bore the title *Gaceta de Lima, desde primero de diciembre de 1743 hasta 18 de enero de 1744*. This first number is particularly interesting because it prints the traditional origin of the word "gazette" and mentions the names of contemporaneous news sheets in Europe.

Colombia and Venezuela.—The first printing office in Colombia, then Nueva Granada, was established at Bogotá in 1737. At first it printed tracts on religious matters, but in 1785, when an earthquake occurred, it issued what is now considered the first attempt in that country to give the public a news sheet. This ill-printed and rudimentary gazette did not last, for its only aim was to spread abroad the news of the earthquake. In 1791 Don Manuel del Socorro Rodríguez, a Cuban, founded a newspaper, in which he printed mainly his poetical and literary works, its other contents being advertisements for runaway slaves, bits of European news, and essays on morals and religion. This newspaper, named *Papel periódico de la ciudad de Santa Fé de Bogotá* appeared irregularly, but lasted for some years.

Another country where a gazette was the first newspaper was Venezuela. The honour of introducing printing into that country is ascribed to Madeo Gallagher and Jaime Lamb in 1808. *Gaceta de Caracas* had its first issue on Oct. 24, 1808. It appeared when Venezuela was in that period of its history known as the colonial age. The first newspaper of what is known historically as the period of independence was *El Correo del Orinoco*. Its first date of publication was June 27, 1818, in Angostura. These two papers marked the beginning of the newspaper press in Venezuela.

The same year that saw the beginning of journalism in Venezuela marks also the beginning of journalism in Brazil. Obviously, the first printed newspaper in the latter country was in Portuguese but, like that of Venezuela, it was called a gazette.

The first newspapers, in the technical sense of that term, for the countries of South America may be listed as follows: Mexico, *Gaceta de México* (1679); Guatemala, *Gaceta de Guatemala* (1729); Peru, *Gaceta de Lima* (1744); Cuba, *La Gaceta de la Habana* (1764); Colombia, *La Gaceta de Santa Fé* (1785); Ecuador, *La Gaceta* (1785); Argentina, *El Telégrafo Mercantil* (1801); Haiti, *La Gaceta del Cabo* (1804); Uruguay, *La Estrella del Sur* (1807); Brazil, *Gazeta do Rio de Janeiro* (1808); Venezuela, *La Gaceta de Caracas* (1808); Chile, *La Aurora de Chile* (1812); Panama, *Mineral del Istmo* (1822); Bolivia, *El Condor de Bolivia* (1825); Paraguay, *El Paraguay Independiente* (1845).

Brazilian Journals.—The honour of being in 1928 the oldest newspaper in South America belongs to *O. Diário de Pernambuco* which was established in 1825. The next newspaper in point of age, founded two years later, is *Jornal do Commercio* of Rio de Janeiro. The latter is an extremely conservative paper of limited

circulation, while the most popular in that city is the evening paper *A Noite* established in 1910 and credited at the close of 1927 with a circulation of 85,000. Possibly the most influential paper is *O Estado* (1876) of São Paulo. *Fanfulla* (1892), an Italian daily of the same city, wields considerable power through the State of São Paulo. Other influential morning papers are *O Paiz* (1884), *A Patria* (1920) and *Correio de Manhã* (1902), all of which are published in Rio de Janeiro. Newspapers in Brazil are often the personal organs of owners to whom they are useful for political purposes. At the fall of the empire Brazilian journals numbered about 600. In 1910 the total exceeded 1,000; since then the increase has been about 100 to a decade.

Argentina and Chile.—The two leading newspapers, not only in Argentina, but also in South America, are *La Prensa*, founded on Oct. 18, 1869, by Dr. José C. Paz, and *La Nación*, founded on Jan. 4, 1870 by Gen. Bartolomé Mitre, of Buenos Aires. For 59 years (1929) both papers have remained in the families of their founders. Each compares favourably with any other newspaper in any country. Both specialize in printing foreign news; possibly *La Nación* pays more for cable tolls than any other newspaper in the world. Classified advertisements are usually a safe index as to character of newspapers because they represent local opinion. Judged by such a yardstick, *La Nación* resembles the *New York Times* and *La Prensa* the *New York World*. The editorial page of *La Nación* is always dignified in subject-matter and serious in mode of treatment. Its Sunday supplement contains contributions from the best writers, not only of Argentina but also of Spain. Much material later appears in book form. To campaign for civic righteousness seems to be the editorial policy of *La Prensa*. Its evening competitor, *La Razón* (1905), once spoke of it as being a safe and serene guide in the difficult task of creating a public conscience. *La Prensa* widens its influence through syndicating to some 175 provincial papers a weekly feature supplement for Saturday or Sunday editions. *La Prensa* operates a free clinic, offers free legal advice to the poor, pays for a free industrial and agricultural bureau, opens its library to the public and awards 1,000 pesos annually to the person teaching the largest number of illiterates to read. The oldest evening paper in Buenos Aires is *El Diario* (1881). The oldest of all is the English paper, *The Standard* (1861), which competes with *The Herald* (1876).

Crossing the Andes, one finds the newspapers of Chile next in influence. First comes *El Mercurio* (1827) of Valparaíso, with separate publication in Santiago and Antofagasta. Its chief competitor is *La Unión* (1885), which also publishes a paper of the same name in Santiago. In the last-mentioned city are the rather influential *La Nación* (1916), and *El Diario Ilustrado*. In Peru the three leading papers are *La Crónica* (1912), *La Prensa* (1903) and *El Comercio* (1839), of Lima.

The more influential newspapers in Mexico are practically limited to the capital city and frequently contain features obtained from American syndicates. They include *El Excelsior* (1919), *El Universal* (1916) and *El Universal Gráfico* (1922). Outside the capital city, mention may be made of *El Informador* (1917) of Guadalajara, *La Tribuna* (1926) of Guaymas, *El Correo de la Tarde* (1885) of Mazatlán and *Diario de Yucatán* (1918) of Mérida.

VI. OTHER COUNTRIES

China.—By no means the least result of the Chinese revolution of 1911 was the amazing expansion of the vernacular press. Actually the movement had begun some years earlier, but after the revolution it developed into a portent. Native newspapers sprang up in all parts of the empire in a night, as it were, and it is not surprising that the Chinese press exhibits most of the undesirable attributes of a mushroom growth. The general quality is poor. Most of the papers are run for political or personal ends, the news supplied by them is untrustworthy and their standard of journalistic ethics is low. This is the more to be regretted as their multitude testifies to the interest which awakened China

takes in affairs and their influence on public opinion is beyond doubt enormous; but little improvement is to be expected until political conditions become more settled. As things are it is only fair to say that, with all its irresponsibility and corruption, the Chinese press is on the whole liberal and patriotic in intention if not always in fact. It may be noted that Chinese periodical publications are on a much higher level than the newspaper press.

Between 20 and 30 European and American newspapers are published in China, more than half of them at Shanghai. The majority are British, including the *North China Daily News* of Shanghai which, founded in 1864, is the oldest foreign daily in China. Other British morning newspapers are: *The Shanghai Times*, *The Central China Post* (Hankow), *The Peking and Tientsin Times*, *The Hongkong Daily Press* and *The South China Morning Post* (Hongkong). The principal British evening papers are *The Shanghai Mercury*, *The North China Daily Mail* (Tientsin), *The Hongkong Telegraph* and *The China Mail* (Hongkong). There are three American morning dailies, *The China Press* (Shanghai); *The Peking Leader* and *The North China Star* (Tientsin)—and three French, *L'Echo de Chine* (Shanghai), *Le Journal de Pékin* and *L'Echo de Tientsin*. There are also a number of Chinese and Japanese-owned journals published in English.

Japan.—There has been a very remarkable development in the press of Japan during recent years, owing to the spread of popular education. Public opinion in Japan today is practically shaped by the press and while some old restrictions remain the tendency is towards complete freedom of discussion. There are about a dozen newspapers in Japan whose capital is about a million yen. The two centres of newspaper activity are Tokyo and Osaka. The *Osaka Mainichi* and the *Osaka Asahi*, the biggest newspapers in Japan, have a daily circulation of a million copies. The *Tokyo Nichinichi* and the *Tokyo Asahi* are subsidiaries of these newspapers. The *Tokyo Hochi*, the *Jiji*, the *Chugai* and the *Kokumin* are all important national newspapers and almost all are politically independent. There are a very large number of newspapers of the second class which penetrate into the country districts, and there are a number of first-class local newspapers. The Japanese press is influenced by American journalism and some of the popular newspapers display news in quite modern style. Every up-to-date method is employed. In the news columns there is a close network of correspondents and private long distance telephone lines, television, air transport, and pigeons are in use.

A great deal of capital is required to start new newspapers. Greater attention is being given to sport and a large space is given to foreign news.

The *Kokumin* is famous for its president, Mr. I. Tokutomi, who is one of the pioneers of the newspaper business, and is a great critic and author. Its tone is conservative. One of the present problems is the keen competition between the papers in the big cities and the local newspapers, the same tendency which is observable in England.

Newspapers for the English speaking residents in Japan are the *Japan Chronicle* (British), the *Japan Advertiser* (American), and the *Japan Times* (Japanese).

The organisations for newspapers in Japan are the Nohom Shimbun Kyokwai (The Japanese Press Association), and the Kokusai Kisha Kyokwai (International Pressmen's Association), both established in 1913.

During recent years there has been a surprising increase in magazines in Japan of an educational character. Seventy per cent of these are published by Seiji Noma, who is called the "Magazine King" of Japan. It is claimed that the magazines are read by ten million people. His list includes magazines for young men, for girls of the high-school grade, magazines for women, and others of an educational and entertaining character.

(R. Dow.)

NEWT, the name applied to the aquatic members of the

family *Salamandridae* which constitute the genus *Molge* (*Triton*). The newts are closely related to the true salamanders, *Salamandra*, from which they differ in the shape of the tail, which is compressed, in relation to their more aquatic habits. They swim with their tails, holding the legs pressed into their sides. A marked sexual dimorphism prevails in most species, the males being more brilliantly coloured and provided with a dorsal crest during the breeding season, lasting through the spring and the early summer. Later in the season the males lose their nuptial ornaments, and the two sexes are more alike; they then retire on land, concealing themselves under stones, logs of wood, or in holes in damp earth, but leaving their retreat at night or in wet weather to search for earth-worms and slugs. In the water they eat tadpoles, insect larvae and crustaceans. Newts regenerate lost parts with facility, including whole limbs. One limb can be regenerated a number of times.

The male courts the female by placing himself before her, vibrating his tail and bending his body in a semicircle. He then emits in front of the female several conical spermatophores adhering to the ground and crowned by a spherical mass of spermatozoa, which the female gathers in the lips of her cloaca, whence they find their way into the lower part of the oviducts, where the eggs are fecundated.

The larvae are provided with three pairs of long, plum-like external gills. The fore limbs are developed before the hind limbs. In a few lakes and ponds, metamorphosis (*q.v.*) does not occur and the newt becomes sexually mature as an enlarged larva.

The genus *Molge* extends over Europe, north-west Africa, south-western Asia, eastern temperate Asia (China and Japan) and most of North America. Over 20 species are distinguished. The British species are the crested newt (*M. cristata*), the common newt (*M. vulgaris*) and the palmated newt (*M. palmata*). The first is the largest, and measures 4 to 6 in. The skin is more or less rugose, with granular warts, a strong fold extends across the throat, and the male is provided with a high dentate dorsal crest which is interrupted over the sacral region; the upper parts are dark, with black spots; the sides are speckled with white, and the lower parts are yellow or orange, spotted or marbled with black; a silvery stripe adorns the side of the tail in the male. The common and the palmated newts are smaller, 2½ to 4 in. in length, with smooth skin. The dorsal crest of the male is high and festooned in the former, low and straight-edged in the latter.

NEW TESTAMENT: see BIBLE.

NEWTON, ALFRED (1829–1907), English zoologist, was born at Geneva on June 11, 1829. In 1854 he was elected travelling fellow of Magdalene college, Cambridge, and subsequently visited many parts of the world, including Lapland, Iceland, Spitsbergen, the West Indies and North America. In 1866 he became the first professor of zoology and comparative anatomy at Cambridge, a position which he retained till his death on June 7, 1907. His services to ornithology and zoogeography were recognized by the Royal Society in 1900, when it awarded him a Royal medal.

He wrote many books, including *Zoology of Ancient Europe* (1862), *Ootheca Wolleyana* (begun in 1864), *Zoology* (1872), and a *Dictionary of Birds* (1893–96), an amplification of the numerous articles on birds which he contributed to the 9th edition of the *Encyclopædia Britannica*.

NEWTON, SIR CHARLES THOMAS (1816–1894), British archaeologist, was born on Sept. 16, 1816, at Bredwardine in Herefordshire, and educated at Shrewsbury Schools and Christ Church, Oxford. He entered the British Museum in 1840 as an assistant in the Antiquities Department. In 1852 Newton left the Museum to become vice-consul at Mitylene, with the object of exploring the coasts and islands of Asia Minor. Aided by funds supplied by Lord Stratford de Redcliffe, then British ambassador at Constantinople, he made in 1852 and 1855 important discoveries of inscriptions at the island of Calymnos, off the coast of Caria; and in 1856–1857 achieved the great archaeological exploit of his life by the discovery of the remains of the mausoleum of Halicarnassus, one of the "seven wonders" of the ancient world. He was greatly assisted by Murdoch Smith, afterwards celebrated

in connection with Persian telegraphs. The results were described by Newton in his *History of Discoveries at Halicarnassus* (1862–1863), written in conjunction with R. P. Pullan, and in his *Travels and Discoveries in the Levant* (1865). These works included particulars of other important discoveries, especially at Branchidae, where he disinterred the statues which had anciently lined the Sacred Way, and at Cnidos, where R. P. Pullan, acting under his direction, found the colossal lion now in the British Museum.

For 25 years, 1860–85, Newton was Keeper of Greek and Roman Antiquities in the British Museum. He was Yates professor of classical archaeology at University college, London, (1880–88). His collected *Essays on Art and Archaeology* were published in 1886. He died at Margate on Nov. 28, 1894.

NEWTON, SIR ISAAC (1642–1727), English natural philosopher, was born at Woolsthorpe near Grantham on Dec. 25, 1642. His father had died the previous October and his mother, Hannah, daughter of J. Ayscough of Market Overton, married again in 1645 Barnabas Smith, Rector of North Welham, Leicestershire.

After his mother's second marriage her son had lived with his grandmother Mrs. Ayscough at Woolsthorpe, but on his stepfather's death his mother returned to her former home and her boy rejoined her.

For some two years he had attended the Grammar School at Grantham, then kept by Mr. Stokes. He is said to have made little progress with his books until a successful fight with another boy aroused a spirit of emulation and led to his becoming head of the school.

At the age of fourteen on his mother's return (1656) he was taken from school to assist her on her farm. This, however, was not a success; he occupied himself with mathematics when he ought to have been attending to his work. His uncle Wm. Ayscough, Rector of Burton Coggles, was a member of Trinity College, Cambridge, and in 1660 by his advice Newton was sent back to school to prepare for Cambridge. On June 5, 1661 he was matriculated as a subsizar at Trinity College. Three years later he was elected as scholar and in Jan. 1665 proceeded in due course to the degree of Bachelor of Arts. In 1667 he was elected a Fellow of the College.

In the early part of 1665 he discovered what is now known as the binomial theorem, and a little later came the elements of the differential calculus which he called Fluxions. In May of the following year he writes "I had entrance into the inverse method of Fluxions" (in modern terms the principles of the Integral Calculus and the method for calculating the area of curves or the volume of solids) "and in the same year (1666) I began to think of gravity extending to the orb of the Moon . . . having thereby compared the force requisite to keep the Moon in her orb with the force of gravity at the surface of the Earth and found them to answer pretty nearly. All this was in the two years 1665 and 1666 for in those years I was in the prime of my age." The same period saw the commencement of his work on Optics and Colour.

The account of Newton's colour experiments was sent to the Royal Society in 1672. He had been elected a Fellow on January 11 of that year and soon got into correspondence with Oldenburg, the secretary. "I shall endeavour," he wrote, "to show my gratitude by communicating what my poor and solitary endeavours can effect towards the promoting of philosophical design." His *New Theory about Light and Colours* was read on Feb. 8th.

The experiments he described showed conclusively, he claimed, that "Light consists of Rays differently refrangible"; that "Colours are not qualifications of Light derived from refractions of natural bodies as is generally believed but original and connate properties which in divers Rays are divers . . . to the same degree of refrangibility ever belongs the same colour and to the same colour ever belongs the same degree of refrangibility." During the period covered by this work he had become Lucasian Professor of Mathematics. Barrow resigned in his favour in 1669, and Newton's first course of lectures dealt with Optics; hence his renewed interest in the subject, and the experiments with the prism bought at Stourbridge Fair in 1666, culminating in the Royal Society paper of 1672. But the paper led to controversy. The Royal Society

solemnly thanked the author "for his ingenious discourse" and he was to be informed "that the society think very much of it."

Robert Hooke along with Ward, Bishop of Salisbury and Robert Boyle were desired to peruse the discourse and report. Hooke in his *Micrographia* (1664) had described an experiment which was fundamentally the same as Newton's with the prism, but he had made no use of it; the theory of colours he attempted to deduce was valueless; however, while admitting the truth of Newton's observations, he declined to accept any of the conclusions drawn from them. The paper, when published, at once attracted attention, and others abroad joined in the discussion, the most important issue of which was Newton's assertion that the length of the band of colours produced at a given distance from the prisms, was the same for prisms of any substance provided their angles were such that the deviation for the mean ray of the band was the same in all.

In this, as we know now, Newton was wrong; the length of the band, the spectrum, is not proportional to the average or mean deviation; it is possible to have two spectra of the same length in which the deviations are markedly different, thus if two such prisms are mounted with their vertices in opposite directions, the light emerging from the second will be achromatic, largely free from colour, but will be deviated from its original path.

Newton's experiments on colour, made in all probability in order to study a defect of the telescope, led him to the belief that the defect was incurable. By putting a divergence lens behind the converging lens of the object glass the colours could again be combined, but, so he concluded, his rays would all be made parallel to their original direction, and would no longer converge to form a real image, which could be magnified by the eyepiece; the telescope could not be made to give a colourless (achromatic) image. This belief he retained throughout his life, but it was wrong. Dispersion and the separation of the colours, are not proportional to deviation.

Shortly after Newton's death Chester Moor Hall invented an achromatic telescope and by 1733 had made several, and in 1758 Dolland the optician took up the matter and constructed satisfactory achromatic lenses.

But his mistake had important consequences; a real image, one, that is, through which the light actually passes, of a distant object can be formed by reflexion at a concave mirror, and since the laws of reflexion, unlike those of refraction through a transparent medium, are independent of colour, the reflected image is the same colour as the object, the rainbow band is there no longer; chromatic aberration, as it is called, is no more a disturbing factor. This then led Newton to make his reflecting telescope in which a concave mirror takes the place of the object glass; the first telescope was made in 1668; the second was sent by him to the Royal Society in December 1671 shortly before his election as a Fellow.

Discussions as to the Optics paper lasted until 1675. "I was so persecuted" he writes in December of that year "with discussions arising out of my theory of light that I blamed my own imprudence for parting with so substantial a blessing as my quiet to run after a shadow." But they had their advantage. They led him to investigate other effects of colour, to enquire how light was produced and to develop the emission or corpuscular theory of light, according to which light is due to the emission by a luminous body of a host of tiny particles travelling in empty space with a speed of 190,000 miles per second; the laws of reflexion and refraction were developed on mechanical principles, aided only by a supplementary hypothesis as to why, when falling on a transparent surface, some of the particles are reflected—bent back into the medium whence they have come—others are refracted, along a new path inclined to the old, into the medium towards which they are travelling. It is a consequence of this theory that light travels more quickly in a dense medium such as glass than in air. The theory was also applied to explain the colours seen when light is reflected from a thin film, a soap film, or the thin layer of air between a convex lens of large radius and a flat reflecting surface on which it rests; in this case when viewed in reflected light of a definite colour a series of dark and light rings

circling round a central black spot is seen. Newton determined the law connecting the radius of a bright ring and the colour of the light and since the radius depends on the colour, the bright rings for the various colours, when white light is used, will be different and the observer will see a series of coloured rings surrounding the black central spot.

Hooke was again a critic; in his *Micrographia* (1664) he had adopted the wave theory of light, due originally to Huyghens, according to which light is energy transmitted by wave motion through a medium pervading space, the universal ether, and had endeavoured to explain, but without success, rectilinear propagation, reflexion and refraction as well as dispersion and the colours of thin plates. Hooke's arguments were vague and carried no conviction to a mind like Newton's; the latter sought a mechanical explanation for all he observed. Newton in his explanation of the reflection and refraction of the corpuscles of a light centre made use of the idea of a wave in an ethereal medium; he rejected Huyghens' theory and thought little of Hooke's attempts at explanation, and so for a hundred years or more Newton's theory held the field. In 1804 Thomas Young, Professor at the Royal Institution, London, established the principle of interference by which he showed that under certain conditions two parcels of light from identical sources falling on a screen could produce a series of bright and dark bands. Along certain lines on the screen there is a maximum of brightness; along others intermediate between these there is darkness. From this and the brilliant work of the French genius Augustin Fresnel, a few years later, came the explanation on the wave theory of all the phenomena of light as then observed.

"In the fourth place," says Newton, writing in 1675, "I suppose light is neither aether nor its vibrating motion but something of a different kind propagated from lucid bodies. . . . Fifthly it is to be supposed that light and aether mutually act upon one another." Did he here build more truly than he knew? Who can say, but we must revert to other work, to other discoveries on which his fame will rest secure till time shall end.

In 1666, when at Woolsthorpe on account of the plague at Cambridge, he "began to think of gravity extending to the orb of the moon," though of this nothing was published for 18 years.

Discussions went on in London at the Royal Society or in the houses of the members, Wren, Seth Ward, Bishop of Salisbury, Robert Boyle, Hooke, Halley, and the others who were active in the Society, until one Wednesday in January 1684 Halley met Wren and Hooke and the latter declared "that he had demonstrated all the laws of the celestial motions." Halley confessed his ignorance and Sir Christopher "to encourage enquiry said he would give Hooke or me"—the quotation is from a letter of Halley to Newton—"two months to bring him a convincing demonstration." Sir Christopher offered to give "a book of 40 shillings" to the one who first found the solution. He was not convinced of Hooke's assertion that he had done it, but wished to conceal the result "that others trying and failing might know how to value it when he would make it public." So it remained till August, when Halley visited Newton at Cambridge and put the question, what would be the path of a body moving under the action of a central force which varied as the inverse square of the distance from the centre. "I then learned," writes Halley in the same letter, "that you had brought this demonstration to perfection." Newton promised to look for the old proof already mentioned but could not find it, "and not finding it did it again and reduced the work into the proposition," which he sent in November to Halley, who immediately returned to Cambridge and persuaded Newton to put them in form for the Royal Society.

On December 10th, 1684, Halley informed the Society that he had lately seen Mr. Newton at Cambridge who had showed him a curious treatise *De Motu* which, upon Mr. Halley's desire, was sent to the Society to be entered on their Register "and a tract, *Propositiones de Motu*" was registered in February 1685 with the date in the margin, 10 Dec. 1684.

But the early months of 1685 were fertile with a new discovery. Newton was away from Cambridge; hitherto his calculations had proceeded on the assumption that the sun and the planets could

each be treated as though they were points, concentrated at their respective centres, through which the various forces were assumed to act; but was this true or was it merely an approximation due to the fact that the planetary distances were so immense that even a great sphere like the sun could in comparison be treated as a point? What will be the force with which the sun attracts an exterior particle?

Newton proceeded to work this out, on the assumption that each particle of the sun attracted the external particle with a force which was proportional to the product of the masses of the two and inversely proportional to the square of the distance between them and found (we know he had no expectation of the result until it emerged from his calculations), that if the sun were of uniform density, or consisted of a series of concentric shells each of uniform density, then the resultant force on the external particle was the same as that which would be exerted by the whole mass of that concentrated at the centre.

It was no approximation, the sun and the planets considered as spherical, really behaved as point centres of force.

In the opinion of Professor Adams it was the difficulty of solving this problem and not the uncertainty as to the moon's distance which caused Newton in 1665 to lay aside his astronomical calculations, which were now resumed with a more correct knowledge of the moon's distance. Newton returned to Cambridge and the writing of the *Principia* was begun in March 1686.

The work is entitled *Philosophiæ Naturalis Principia Mathematica*. It is in three books, the first *De Motu Corporum* was finished on April 28, 1686 and exhibited to the Royal Society on that day. On June 20, 1687, Newton wrote that the second book was ready. "The third I now design to suppress. Philosophy is such an impertinently litigious lady that a man had as good be engaged in lawsuits as have to do with her." Halley was able to prevent this, and on Sept. 6, 1687 the third book described as *De Mundi Systemate* was presented; the whole was published about Midsummer 1687.

We owe much to Halley; at the time the Royal Society was in difficulties as to funds he took the whole cost on himself. Hooke, when the first book was presented, claimed that he had forestalled Newton in a great part of it, and in the correspondence which followed Halley did all he could to smooth over the difficulties and persuade Newton to continue his work. Newton's letter quoted above indicates his own feelings and in a letter to Halley of July 14, 1686 he had written, "I have considered how best to compose the present dispute, and I think it may be done by the enclosed scholium to the fourth proposition."

In a corollary to the fourth proposition Newton showed that Kepler's third law was a consequence of the elliptic path of a planet under an inverse square law; the scholium runs:

"The case of the sixth corollary applies to the heavenly bodies as our friends Wren, Hooke and Halley have already inferred and therefore I have decided to develop fully all the consequences of a force decreasing as the inverse square." The great work did this: the *Principia* established Newton's fame; some little time elapsed before it was fully accepted on the Continent but for more than 200 years it reigned supreme, and all theories of cosmogony were based on the principles laid down by Newton. His mechanics guided astronomers and men of science in their search for natural knowledge. And if in these last years Einstein has carried us some steps further, has picked up some few more of the jewels of truth, which Newton sought on the shore, Newton's laws remain, included it may be, in a more comprehensive statement of the truth.

In 1687 James II. tried to force the University to admit as a Master of Arts, Father Alban Francis, a Benedictine monk, without taking the oaths of allegiance and supremacy. Newton was one of those who led the resistance to the royal action, and appeared before Lord Jeffreys to argue the case for Cambridge. In the end the deputies were reprimanded, and Pechell the Vice Chancellor was deprived of his office. Newton's share in the affair led to his being elected member for the University in 1689, retaining the seat till the dissolution next year. He was elected again in 1701, but he never took any prominent part in

politics.

On the dissolution of Parliament in 1690 he returned to Cambridge and continued for a time his mathematical work; this was interrupted in 1692-94 by a serious illness. He was suffering from insomnia and nervous trouble. There was a report that he was going out of his mind. Huyghens in June 1694 wrote to Leibnitz "I do not know if you are acquainted with the accident to the good Mr. Newton, namely, that he has had an attack of phrenitis which lasted eighteen months and of which they say his friends have cured him by means of remedies and keeping him shut up." For some time his friends had been anxious to obtain for him some recognition of his work; this came in 1695. Wren, his friend Charles Montague, Lord Halifax, a former Fellow of Trinity who was Chancellor of the Exchequer, offered him the post of Warden of the Mint. This he accepted and four years later became Master. In the same year he was elected one of the eight Foreign Associates of the French Academy of Science.

In 1696 John Bernoulli addressed a letter to the mathematicians of Europe challenging them to solve two problems and giving six months for the solution. On January 29, 1697 Newton received from France two copies of the printed paper containing the problems and the following day sent the solution to Montague, then President of the Royal Society. They were transmitted anonymously to Bernoulli, who recognised the author in his disguise "tanquam ex ungue leonem."

As Warden of the Mint Newton had retained his Cambridge offices, but soon after his appointment as Master he named Whiston as Deputy, and in 1701 he resigned his Professorship and the Fellowship at Trinity. Whiston became Lucasian Professor. Newton had moved to London, and continued his duties as Master with marked efficiency until his death in 1727.

The remainder of his life calls for little notice; in 1703 he became President of the Royal Society and was re-elected annually until his death. Queen Anne visited Cambridge in 1705 as the guest at Trinity Lodge of the Master, Dr. Bentley, and on this occasion Newton was knighted. About the same time the controversy with Leibnitz as to the invention of the differential calculus began. In a review published anonymously of Newton's tract on quadrature, Leibnitz, in 1705, implied that Newton had borrowed from him the idea of Fluxions.

The controversy lasted many years. Leibnitz died in 1716 but it continued to affect English mathematics for more than a century. The matter is discussed very fully in the article "Newton" in the *Dictionary of National Biography* and in Ball's short *History of Mathematics*. Leibnitz had used the method in his note books of 1675, it occurs in a letter to Newton of 1677, and was published in 1684. Newton used his method of Fluxions in 1666, gave an account of it in manuscript to friends and among others to Collins, in letters from 1669 onwards but did not publish it until 1693. It was some of these letters which Leibnitz saw when in London in 1676, and previously to that, copies of one at least of Newton's letters to Collins had been sent to him. During this visit it appears probable that he saw Newton's tract on the subject. In the middle of 1708 Newton, at the urgent request of Dr. Bentley, consented to let Roger Cotes, a Fellow of Trinity, edit a second edition of the *Principia*; the volume was published in 1713, a third edition by Pemberton appeared in 1726.

Early in 1727 Newton whose health had been failing for some time was taken seriously ill; he died of stone on March 20, 1727, and was buried in Westminster Abbey on March 28th. There are portraits of him by Kneller and Thornhill in the possession of Lord Portsmouth and a second one by Kneller at Petworth. The Royal Society possesses three, one of which by Jervas was presented by Newton in 1617 and hangs over the president's chair, while at Trinity College there are a number. The statue by Roubillac was given to the College in 1750 by the Master, Dr. Smith.

BIBLIOGRAPHY.—*Bibliography of the Works of Sir Isaac Newton, with a List of Books illustrating his Works and Notes*, by G. J. Gray (second edition 1907); *Isaac Newton, 1642-1727* (bibl.) a collected edition of Newton's work was published at Lausanne and Geneva in 1744, which gives all the published works with the not unimportant exceptions of the *Arithmetica Universalis*, the *Principia*, the *Optics*

and the *Methodus Fluxionum*. The fullest edition yet published is that issued by Samuel Horsley in 1779-85, under the title *Opera quae exstant omnia*; it is not complete, among notable omissions being the papers published in the *Philosophical Transactions*, and is moreover very scarce.

The standard biography is *Memoirs of the Life, Writings and Discoveries of Sir Isaac Newton*, by Sir David Brewster, 1855; it was reprinted in 1860. Brewster also wrote a short *Life of Sir Isaac Newton*, 1831, of which a new edition appeared in 1908. Valuable critical commentaries are to be found in *Essays on the Life and Works of Newton*, by Augustus de Morgan, edited with notes and appendices by P. E. B. Jourdain in 1914. A brief account of Newton's life and works is given in *Sir Isaac Newton*, by S. Brodetsky, 1927. Of great value to students of Newton is the *Catalogue of the Portsmouth Collection of Books and Papers written by or belonging to Sir Isaac Newton*, 1888 which describes the great mass of Newton's papers which came at his death into the hands of Mr. Conduitt. S. P. Rigaud, *Correspondence of Scientific Men of the 17th Century, etc., from the Originals in the Collection of the Earl of Macclesfield*, 1841, J. Edleston, Editor of the second edition of the *Principia*, *Correspondence of Sir Isaac Newton and Professor Cotes, including letters of other Eminent Men*, 1850, contain many Newton letters, and the latter volume includes a synoptical view of Newton's life. Among general commentaries must be mentioned:—H. Pemberton, *A View of Sir Isaac Newton's Philosophy*, 1728; Colin Maclaurin, *Sir Isaac Newton's Philosophical Discoveries*, 1775; and F. Rosenberger, *Isaac Newton und seine Physikalische Principien*, 1895.

Since the first issue in 1687 there have been many editions of the *Principia*, including two in Newton's lifetime. The Geneva reprint of 1739-42 contains a voluminous commentary by le Seur and Sacquier, and was long used. Lord Kelvin and H. Blackburn edited a very good edition, published at Glasgow in 1874. The first three sections of Book I. of the *Principia* have been edited by, among others, J. Carr, 1821; J. H. Evans, 1838; G. L. Cooke, 1850; P. Frost, 1883 (fourth edition). An English translation of the *Principia* was first published by Andrew Motte in 1729; the best edition is that of 1803. S. P. Rigaud, *Historical Essay on the First Publication of Sir Isaac Newton's Principia*, 1838; W. W. R. Ball, *Essay on Newton's Principia*, 1893; J. W. L. Glaisher, *Bi-Centenary of Newton's Principia*, 1888; P. G. Tait, *Newton's Laws of Motion*, 1899; *Isaac Newton, 1642-1727, A Memorial Volume edited for the Mathematical Association by W. J. Greenstreet* (1927); *Sir Isaac Newton, 1727-1927, A Bi-Centenary Evaluation of His Work* (1928). The *Opticks*, first published in 1704, went through three editions in Newton's lifetime; the last (fourth) edition appeared in 1730. Of great importance for the controversy with Leibnitz is the report drawn up by order of the Royal Society, published under the title *Commercium Epistolicum*, 1712, of which editions appeared in 1722 and 1725. (R. T. GL.)

NEWTON, JOHN (1725-1807), English divine, the friend of William Cowper, was born in London on July 24, 1725 (O.S.). His father, who for a long time was master of a ship in the Mediterranean trade, became in 1748 governor of York Fort, Hudson Bay, where he died in 1751. The lad had little education and served on his father's ship from 1737 to 1742; shortly afterwards he was impressed on board a man-of-war, the "Harwich," where he was made a midshipman. For an attempt to escape while his ship lay off Plymouth he was degraded, and treated with so much severity that he exchanged into an African trader. He made many voyages as mate and then as master on slave-trading ships, devoting his leisure to the improvement of his education. He left the sea in 1755, when he was appointed tide-surveyor at Liverpool. He began to study Greek and Hebrew, and in 1758 applied to the archbishop of York for ordination. This was refused him, but, having had the curacy of Olney offered to him in April 1764 he was ordained by the bishop of Lincoln. In October 1767 William Cowper settled in the parish. An intimate friendship sprang up between the two men, and they published together the *Olney Hymns* (1779). In 1779 Newton left Olney to become rector of St. Mary Woolnoth, London, where he laboured with unremitting diligence and great popularity until his death on Dec. 31, 1807.

Like Cowper, Newton held Calvinistic views, although his evangelical fervour allied him closely with the sentiments of Wesley and the Methodists. His fame rests on certain of the *Olney Hymns* (e.g., "Glorious things of Thee are spoken," "How sweet the name of Jesus sounds," "One there is above all others"), remarkable for vigour, simplicity and directness of devotional utterance.

His prose works include an *Authentic Narrative of some Interesting and Remarkable Particulars in the Life of John Newton* (1764), *Omicron* (a series of letters on religion, 1774), and *Cardiphonia* (1781). His *Letters to a Wife* (1793) and *Letters to Rev. W. Bull*

(posthumous, 1847) illustrate the frankness with which he exposed his most intimate personal experiences. A *Life of Newton* by Richard Cecil was prefixed to a collected edition of his works (6 vols., 1808; 1 vol. 1827). See also T. Wright, *The Town of Cowper*.

NEWTON, JOHN (1823–1895), American general and engineer, was born in Norfolk, Va., on Aug. 24, 1823, and graduated at the U.S. Military Academy in 1842. From 1842 to 1861 he was engaged in coast defence constructions and waterway improvements; he was assistant professor of engineering in the Military Academy from 1843 to 1846, became a captain in 1856, and was chief engineer in the Utah expedition of 1857–58. He served in the Virginian campaign of 1861, and was promoted brigadier-general, U.S. volunteers. He distinguished himself in the Seven Days' battle and at Antietam, and after the battle of Fredericksburg was made major-general, U.S. volunteers. In the Chancellorsville campaign Newton took part in the storming of Marye's heights at Fredericksburg, on May 3, 1863, and at the battle of Gettysburg he was for a time in command of the I. Corps. Later in Sherman's army, as a division commander under Gen. Oliver O. Howard, he took part in the Atlanta campaign. For gallant conduct at Peach Tree creek he was made brevet brigadier-general, and at the close of the war was made brevet major-general, U.S. army. In 1884, he became chief of engineers, and held this position until his retirement in 1886. In 1887–88 he was commissioner of public works in New York, and from 1888 until his death on May 1, 1895, was president of the Panama railway.

See Gustavus Smith, *In Memoriam of General John Newton* (1895).

NEWTON, a city of Iowa, U.S.A., on Federal highway 32, 35 m. E. by N. of Des Moines; the county seat of Jasper county. It is served by the Minneapolis and St. Louis and the Rock Island railways, and by several motor bus lines. Pop. (1920) 6,627 (93% native white); 1928 local estimate 12,000. It is an important manufacturing centre, with an output in 1927 valued at \$61,986,481. Three of the large washing-machine companies have their factories here, making nearly 400,000 machines in a year. Other distinctive products are trenching machines, show cases and advertising novelties. The city was founded in 1846 and incorporated in 1857.

NEWTON, a city of Kansas, U.S.A., 160 m. S.W. of Kansas City, in the fertile Arkansas river valley, on Federal highways 50S and 81, and served by the Missouri Pacific and the Santa Fe railway systems; the county seat of Harvey county. Pop. 9,781 in 1920 (84% native white); estimated locally at 10,500 in 1928. It is the seat of Bethel college, founded (1887) and still supported by the Mennonites; a division point on the Santa Fe, which furnishes employment to over 1,200 persons; a supply centre for the Fred Harvey system of hotels and restaurants along the Santa Fe route; and a shipping point for grain, fruit and other agricultural products. Its principal manufactures are flour (800,000 bbl. a year), threshing machines, brooms, ice, butter and poultry products. Newton was founded in 1871 and chartered in 1872. For several years, beginning in 1873, it was the focus of a large immigration of German Mennonites from Russia and various parts of the United States, who played an important part in building up the city and developing the surrounding country. Each family from Russia brought over a bushel or more of Crimean wheat for seed, from which was grown the first crop of hard winter wheat in Kansas. Since 1927 Newton has had a commission-manager form of government.

NEWTON, a city of Middlesex county, Massachusetts, U.S.A., 10 m. W. of Boston, on the southern bank of the Charles river and the Boston and Albany railroad. Pop. (1920) 46,054 (20% foreign-born white), 53,003 in 1925 (State census); 1928 local estimate 63,000. The city has 11 m. of river front and an area of 18 square miles. Within its boundaries are 11 villages and 34 parks, including parts of the metropolitan park system. It is primarily a residential suburb, but it has a variety of manufacturing industries, with an output in 1925 valued at \$16,491,932. The assessed valuation for 1927 was \$140,071,600. Newton was incorporated as a separate town in 1688 and received its present name in 1691. In 1873 it was chartered as a city. A monument marks the site of Waban's wigwam, where John Eliot, on Oct. 28,

1646, founded the first Indian church. At Newton Centre is the Newton Theological Institution, the first Baptist theological seminary established in America (1825).

NEWTON ABBOT, a town and seaport of Devonshire, England, 20 m. S. by W. of Exeter by G.W.R. Pop. (1921) 13,837. Newton Abbot was given to the abbot of Tor by the founder of the monastery (1196). Situated at the head of the Teign estuary, the town grew rapidly in the 19th century. The two parish churches, St. Mary's in Wolborough, and All Saints' in Highweek, are Perpendicular in style. St. Mary's contains a Norman font. Of the 14th century chapel of St. Leonard, only a tower survives. The Jacobean Forde House was visited by Charles I. and William of Orange, who first read his declaration to the people of England at Newton Abbot market-cross. The portion of Newton Abbot in the parish of Highweek was formerly a separate town known as Newton Bushel.

NEWTON-IN-MAKERFIELD or Newton-le-Willows, an urban district in Lancashire, England, 15½ m. W. of Manchester by the L.M.S. railway. Pop. (1921) 18,772. Newton-in-Makerfield gave its name in Saxon times to one of the hundreds of Lancashire. The barony was held by the Banastres from the Conquest to 1286 and passed successively to the Langtons, Fleetwoods and Leghs. The barons were not summoned to Parliament, and the title has fallen into disuse since the abolition of feudal tenures. The courts-baron and courts-leet are held twice annually. Near the town is a moated Elizabethan half-timbered house, and also an ancient barrow. The industrial establishments include foundries, printing and stationery works, paper mills and glass works. Coal abounds in the neighbourhood.

NEWTOWN, a market town of Montgomeryshire, Wales, situated on both banks of the Severn in a narrow portion of the valley near the eastern border of the county. Pop. of urban district of Newtown and Llanllwchaearn (1921) 5,666. It now shares with Welshpool the privilege of being the administrative capital of the shire. We first hear of it as a Llan (church settlement) known as Llanfair Cedewain, in the 13th century. The presence of water-power was probably a factor in the origin and growth of the settlement at this time. The Norman Mortimers established here the market of their new territories on the border. In the 15th century the New Town received a municipal charter with a constitution modelled upon that of Hereford and Breteuil, but the corporation was abolished in the days of Charles I. Through the early 19th century the flannel factories of the town were of great importance but the flannel industry is no longer carried on, though there are still distributing warehouses. In the days of coach roads Newtown was a route centre, for the old road from Ludlow via Bishops' Castle and Kerry had to drop in to the Severn valley and so reached Newtown.

The old church, now in ruins, is superseded by the modern St. Mary's, with the font and rood-screen of the old building.

NEWTOWNARDS, a town of co. Down, Ireland, near the northern extremity of Strangford lough, on a branch of the Belfast and co. Down railway, 9½ m. E. of Belfast. Pop. (1921) 9,587. The town owes its origin to a Dominican monastery founded in 1244 by Walter de Burgh. It received a charter from James I. The ruined abbey of Moville, 1½ m. N.E., is attributed to St. Finian (c. 550). The town is sheltered by the Scrabo hills on the west and north.

NEW ULM, a city of southern Minnesota, U.S.A., on the south bank of the Minnesota river, 88 m. S.W. of Minneapolis; the county seat of Brown county. It is on Federal highway 14 and is served by the Chicago and North Western and the Minneapolis and St. Louis railways. Pop. (1920) 6,745 (22% foreign-born white); estimated locally at 8,000 in 1928. It is an important trading centre in a rich agricultural region, has a large milling industry and is the seat of Dr. Martin Luther college (1884). New Ulm was settled about 1853. During the Sioux uprising of 1862 it was twice attacked and almost destroyed.

NEW WASHINGTON, a municipality (with administrative centre and 43 *barrios* or districts) of the province of Capiz, island of Panay, Philippine Islands, on the north coast about 17 m. west of Capiz, the provincial capital. Pop. (1918) 24,453.

The cultivation of rice, sugar, abacá and corn, and the breeding of cattle and horses are the principal industries. This place is the port for the municipality of Calivo, which is the market town for the Aklan valley. In 1918, it had 119 household industry establishments with output valued at 20,400 pesos. Nine of the 13 schools were public. The language spoken is a dialect of Bisayan.

NEW WESTMINSTER, city on the north bank of the Fraser river, 17 m. from the mouth, and third port of British Columbia. Pop. (1921) 14,495. Founded in 1859, it was the capital of British Columbia when the British possessions on the Pacific coast formed two colonies—i.e., British Columbia (the mainland portion) and Vancouver island. The city has a fine harbour with 30 to 40 ft. of water, which is managed by a harbour commission and has a large trade, particularly in timber. New Westminster is a manufacturing centre, fish, fruit and vegetable canning, iron-founding, shingle and lumber mills and ship-building being among the industries; and fruit-growing, dairying and mining are carried on in the district. The city is on the Canadian Pacific, Great Northern and Canadian National railways, and is connected with Vancouver, 12 m. distant, by electric railway. The Columbian Methodist college is here.

NEW YEAR'S DAY, the first day of the year. In the Gregorian calendar this date occurs twelve days earlier than in the Julian; thus New Year's Day is the English 13th of January.

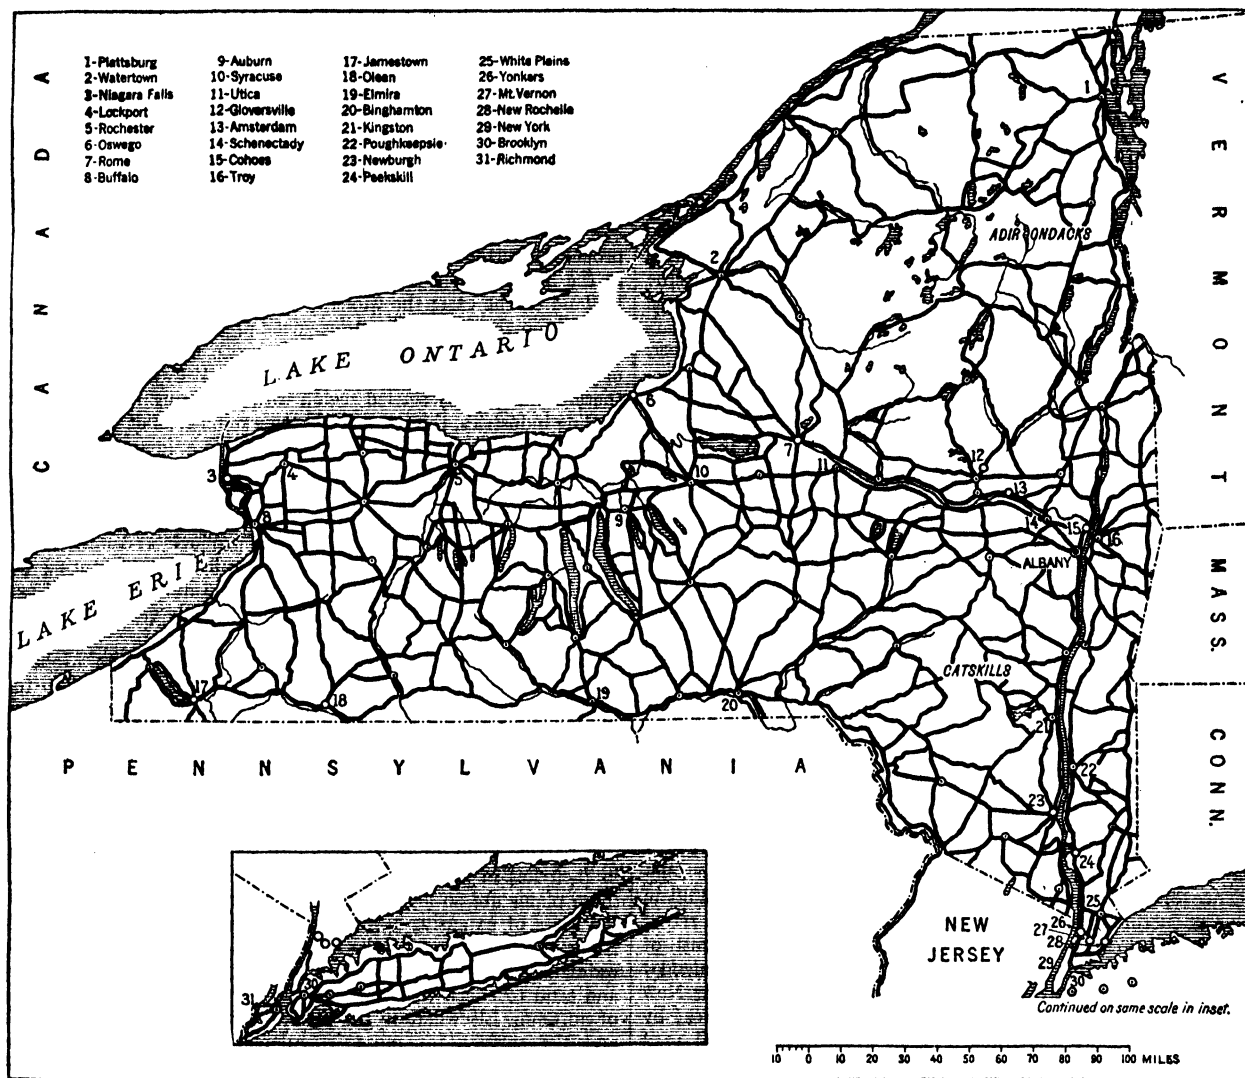

The ancient Egyptians, Phoenicians and Persians began their year at the autumnal equinox (Sept. 21) and the Greeks until the 5th century B.C. at the winter solstice (Dec. 21). The ancient Romans once celebrated the beginning of the year on the 21st of December, but Caesar by the adoption of the Julian calendar postponed it to the 1st of January. The Jews have always reckoned their civil year from the first day of the month of Tishri (Sept. 6–Oct. 5), but their ecclesiastical year begins at the spring equinox (March 21). The 25th of March was the usual date among most Christian peoples in early mediæval days. In Anglo-Saxon England, however, the 25th of December was New Year's Day. At the Norman Conquest owing, it is believed, to the coincidence of his coronation being arranged for that date, William the Conqueror ordered that the year should start on the 1st of January. But later England began her year with the rest of Christendom on the 25th of March. The Gregorian calendar (1582), which restored the 1st of January to its position as New Year's Day, was accepted by all Catholic countries at once; by Germany, Denmark and Sweden about 1700, but not until 1753 by England.

NEW YORK, one of the original 13 United States of America, situated between 40° 29' 40" and 45° 0' 2" N. and between 71° 51' and 79° 45' 54.4" W. Although one of the smaller States in the Union, being 29th in area, New York ranks first in population and in wealth, and has won for itself the name "Empire State." Its northern boundary is, for the most part, formed by Lake Ontario and the St. Lawrence river, which separate it from the Province of Ontario, Canada; but north of the Adirondacks the boundary line leaves the St. Lawrence, extending in a due east direction to the lower end of Lake Champlain. Thus the boundary between New York and the Province of Quebec, Canada, is wholly artificial. Vermont, Massachusetts and Connecticut bound New York on the east; the Atlantic ocean, New Jersey and Pennsylvania on the south; and Pennsylvania, Lake Erie and the Niagara river on the west. The State has a triangular outline, with a breadth from east to west of 326.46 m. and from north to south, on the line of the Hudson, of 300 miles. In addition, it includes Long island and Staten island on the Atlantic coast. Its land area is 47,654 sq.m. and the area of the inland waters is 1,550 sq.m., giving a total area of 49,204 sq. miles. In addition to this, New York includes 3,140 sq.m. of water in Lakes Ontario and Erie.

Physical Features.—The most notable topographic feature is the roughly circular mountain area of north-eastern New York, known as the Adirondack mountains (*q.v.*). This is a very ancient mountain mass of crystalline rocks resembling more the Laurentian mountains of Canada than the Appalachians. Indeed, it is

commonly considered to be an extension of the Canadian mountains. Parts of the crystalline area are worn down to a condition of low relief, but in the main mountain mass, although greatly worn, there are still elevations of truly mountainous proportions. The highest peak is Mt. Marcy (5,344 ft.), though associated with it are several other peaks with an elevation from 4,000 to 5,000 feet. Even the higher summits are worn to a rounded condition, and are therefore for the most part forest-covered up to the timber line which, on Mt. Marcy, is at an elevation of about 4,900 feet. From the crest of the dome of the Adirondacks proper the surface slopes in all directions to surrounding lowlands; to the St. Lawrence valley on the north; the Champlain-Hudson lowland on the east; the Mohawk valley on the south; and Lake Ontario on the west. The Adirondack area proper, and much of the surrounding ring of more recent rocks, is either too rugged, or has a soil too thin and rocky for extensive agriculture. It is therefore a sparsely settled region with lumbering for one of the leading industries, though there is some mining, as of iron. Owing to the varied and beautiful scenery, this is a favourite summer resort; the game of the forest and the fishing in the streams and in the multitude of lakes serve as further attractions. In the peripheral ring farming increases, especially dairying; and manufacturing industries connected with the products of forest, farms and mines are developed. These and other manufacturing industries are greatly aided by the extensive water-power furnished by the mountain streams which flow out radially from the central area.

South of the Adirondack region, and south of the Mohawk valley, rises a high-level plateau which extends westward to the Pennsylvania boundary. Here the rocks are all essentially horizontal and of the Palæozoic age, mainly Devonian. This plateau province, which includes more than half the State, differs greatly from place to place. Its elevation decreases toward the north by a series of steps, the lowest elevation being on the Ontario plain which skirts the southern shore of Lake Ontario. Similar to this is a narrow plain along the southern shore of Lake Erie, which, in fact, lies in a shallow depression in this Erie plain. Both of these plains are so level, and have so fertile a soil that they are the seats of extensive agriculture, especially fruit raising, which is further encouraged by the influence of the large bodies of lake water that moderate the heat of summer and the cold of winter, and tend to check the late frosts of spring and the early frosts of autumn. Elsewhere in the plateau province the land is higher and the surface far more irregular, increasing in ruggedness toward both the south and the east. Elevations of 1,500 and 2,000 ft. are common in this region all the way from Chautauqua county in the extreme west to the Catskill mountains in the east; and in places the surface becomes so rugged as to simulate the features of mountains and locally to win the name of mountain. Valleys are deeply sunk in the plateau, the largest with bottom lands of sufficient width to give rise to strips of fertile farmland. The valley walls rise to undulating and often fairly level uplands, which are, in large part, cleared of forest. In the main they are grazing lands—the seat of important dairy and sheep-raising industries. This is the region of abandoned farm houses. Since the plateau region is a northward extension of the Alleghany plateau, which skirts the western base of the Appalachian mountains, it rises as the mountains are approached. Thus, in south-east New York, where the Appalachians enter the State, the plateau becomes much higher than in the west, reaching its culmination in the Catskills. Here, partly because of elevation, and partly because of the resistant nature of the Catskill sandstone, dissection has so sculptured the plateau as to carve it into a mountainous mass generally known as the Catskill mountains (*q.v.*). In this part of the plateau, summit elevations of from 3,000 to 4,000 ft. are common, the highest point being Slide mountain (4,205 ft.). Like the Adirondacks, this region is largely forest covered, and is a favourite summer resort; but it is far less a wilderness than the Adirondacks, and in places is cleared for farming, especially for pasturage. In the plateau province there are other areas known as mountains, of which the Helderberg mountains are the most conspicuous. This formation is really an escarpment facing

MAP SHOWING THE MAIN ROADS IN NEW YORK

the lower Mohawk and the Hudson river, south of Albany, where there is a downward step in the plateau. The steeply rising face of the plateau here is due to the resistance of a durable layer of limestone, known as the Helderberg limestone. Of other lower escarpments the most notable is the Niagara which extends eastward from Canada, past Lewiston and Lockport—a downward step from the Erie to the Ontario plain.

South and south-east of the Catskills, although including only a small portion of the State, there are a number of different topographic features, due to the belts of different rock structure which cross the State from south-west to north-east. The most pronounced of these upfolded strata in New York form the low Shawangunk mountains, which descend, toward the south-east, to a lowland region of folded strata of limestone, slate and other rocks in Orange and Dutchess counties. This lowland area, due to the non-resistant character of the strata, is a continuation of the Great Valley of the Appalachians, and extends north-east into Vermont and south-west across New Jersey, Pennsylvania, Maryland and Virginia. It is bounded on its south-east side by the Highlands, a belt of ancient crystalline rocks which extends north-east into Connecticut and Massachusetts, and south-west into the highlands of New Jersey and thence to the Blue Ridge. South of the Highlands, in New Jersey, but extending to the very banks of the Hudson, is a belt of Triassic sandstone with intrusions of trap rock, which, on account of its peculiar columnar

jointing, has developed a palisade structure—the famous Palisades of the lower Hudson. Long Island, though modified by extensive glacial deposits, may be considered a north-east extension of the coastal plains which attain a much more perfect development in New Jersey and the States farther south.

The entire surface of New York, with the exception of a very small area in the extreme west, in Chautauqua and Cattaraugus counties, was covered by the continental glacier. It broadened and deepened many of the valleys; rounded the hills; turned aside many streams, causing changes in drainage and giving rise to innumerable waterfalls and rapids; and it formed the thousands of lakes, large and small, which dot the surface. As the ice receded, it halted at various points, forming moraines and other glacial deposits. Thus the soil of almost the entire State has been derived by glacial action.

The drainage of New York finds its way to the sea in various directions. The St. Lawrence system receives most, mainly from short streams from the plateau province and from the Adirondacks. A small part of the State, in the west, drains to the Ohio, and thence, by way of the Mississippi, to the Gulf of Mexico; and a much larger area drains into the Susquehanna, entering the head of Chesapeake bay. A part of the Catskills, and the region farther south, drains into Delaware bay through the Delaware river. Thus New York is pre-eminently a divide region, sending its drainage, by various courses, into widely separated parts of the

ocean. Only the Hudson (*q.v.*) and a few streams in the extreme south have independent courses to the sea within the State itself. The Hudson is by far the most important river in the State, for, owing to the sinking of the land, which has admitted the tide as far as Troy, it is navigable for 151 m. from the sea. It is noted for its remarkable scenery, especially where it crosses the Highlands. Westward from Troy, the Mohawk valley furnishes a

BY COURTESY OF THE BUFFALO CHAMBER OF COMMERCE

ENTRANCE TO BUFFALO HARBOUR, ONE OF THE TEN GREATEST PORTS IN THE WORLD

Buffalo is situated at the foot of the Great Lakes, where navigation for the big lake carriers ends. It ranks fourth among United States ports and seventh among the industrial cities of America

highway which is followed by canal, railway and motor road. Thus there is here a gap, easily traversed, across the Appalachian mountains and plateaux to the more level and fertile plains beyond.

There are thousands of lakes and ponds in the State, most of them very small and all, even including Lakes Erie and Ontario, the result of glacial action. The largest lake apart from Erie and Ontario is the beautiful Lake Champlain, which lies on the eastern boundary. The largest lake entirely within the State is Lake George. In the central part of the State area is a series of peculiar elongated lakes, extending in a nearly north-south direction, known as the Finger lakes. The largest of these are Cayuga, Seneca, Keuka, Canandaigua, Owasco and Skaneateles. Here too is Watkins Glen acquired by the State for a park. In the extreme western part of the State is Chautauqua lake, beautifully situated in the plateau of western New York. New York is noted for its many falls and rapids, some of them of great beauty. Of these the largest is the cataract of Niagara, about 1 m. wide and 165 ft. high. The American fall is entirely within the State; but the Canadian boundary-line passes down the centre of the Horseshoe or Canadian fall. Other notable falls are those of the Genesee at Portage and at Rochester, the falls in the Cayuga and the Seneca valleys, Trenton falls, the Falls of Ticonderoga, and a multitude of falls and rapids in the Adirondack region.

New York has an extensive coast-line along the Great Lakes, 75 m. on Lake Erie and over 200 m. on Lake Ontario. The largest of the lake ports is at Buffalo at the head of Niagara river, where, owing to the Niagara cataract, lake boats from the west must transfer their goods to rail or canal. Buffalo lies at the lower end of natural lake navigation, though by the building of a ship canal in Canada, lake steamers can proceed into Lake Ontario and thence to the St. Lawrence. The ocean coast-line, though of limited extent, is by far the most important in the United States. The greater part of the sea-coast is on Long Island—a low, sandy coast, the seat of numerous summer resorts and of some fishing. The mainland, opposite the western end of Long Island, is traversed by the lower Hudson and other channels—submerged valleys—which form a branching bay with several islands, the largest of which are Staten and Manhattan islands. This bay makes an excellent protected harbour, with an immense water front, at the outlet of the chief natural highway from the east to the interior of the country.

Climate.—In general the climate of New York is typical of that of northern United States, a climate of extremes, hot in summer, and cold in winter, and yet healthful, stimulating, and, on the whole, not disagreeable. The average mean annual tem-

perature is not far from 45° though it varies from over 50° near New York city, and 48° near the Lake Erie shore, to less than 40° in the high Adirondacks. The average maximum summer heat is about 93°, a temperature of 100° being rarely reached. In the winter the temperature descends below zero during exceptionally cold spells. Most of the rivers and smaller lakes freeze over completely in winter. The average rainfall is between 40 and 45 in. but it is less than 30 in. in the Lake Champlain valley and over 55 in. north of New York city. In the Adirondack region the snowfall is heavy, the winter long and severe. In central New York it is not uncommon for snow to accumulate to the depth of 3 or 4 ft. and yet this is not persistent. About New York city, and on Long Island, the snow rarely exceeds 1 ft. in depth. The climate is variable owing to the frequent passage of cyclonic storms from the west and south-west, bringing warmer weather with rain and snow in winter, and causing days of great heat and humidity, with thunder-storms, in summer. About New York city, and on Long Island, the ocean softens the rigours of winter, and through the influence of cold surface waters off the coast, tempers the heat of summer.

Soil.—The soil is mostly glacial drift, but its depth and composition often vary greatly even within small areas. The most widely distributed soil, especially in the west half of the State, is mainly a clay which was formed by the glacial pulverizing of limestone and shale and is still forming from the decomposition of fragments of these substances. In the larger valleys and along the shores of lakes alluvium is mixed with this clay.

Population.—New York outstripped Pennsylvania in population in the first decade of the 19th century, and Virginia in the second decade, and since 1820 it has been the most populous State in the Union. The population at certain selected censuses was as follows: 340,120 in 1790; 1,372,812 in 1820; 3,880,735 in 1860; 5,082,871 in 1880; 7,268,894 in 1900; 9,113,614 in 1910; and 10,385,227 in 1920, a gain of 14% in the last decade. In 1928, according to United States census bureau estimate, the population was 11,550,000. The native white population in 1920 was 7,385,915, of whom 3,668,266 were of native parentage; 2,844,083 of foreign parentage; and 873,566 of mixed parentage. The for-

GRAPH SHOWING GROWTH OF POPULATION OF NEW YORK DURING 1790 TO 1925 (THE FIGURE FOR 1925 IS THAT OF THE STATE CENSUS)

eign-born white population was 2,786,122, including 545,173 natives of Italy, 529,240 of Russia, 295,650 of Germany, 284,747 of Ireland, 247,519 of Poland, 151,172 of Austria, 135,305 of England and 111,974 of Canada. The negro population was 198,483, or only 1.9% of the total. The average population per square mile in 1920 was 217.9. The urban population (in cities with 2,500 or more inhabitants), was 82% in 1925 (State census). Of the State's population 52.6% lived in New York city. In 1925 there were 20 cities with a population over 30,000; those with a population exceeding 100,000 were:

	1925	1927 Estimate
New York	5,873,356	5,970,800
Bronx Borough	872,168	926,100
Brooklyn "	2,203,991	2,274,400

Rochester	316,786	324,500
Syracuse	182,003	197,000
Albany	117,820	119,500
Yonkers	113,647	118,800
Utica	101,604	103,400

Government.—Since becoming a State, New York has been governed under four constitutions, adopted in 1777, 1821, 1846 and 1894 respectively. A Constitutional Convention met and proposed a new Constitution in 1915, but it was rejected by the people. The present Constitution may be amended by a majority vote of the members of two successive legislatures and approval by the electorate.

Suffrage is bestowed on all citizens who have attained the age of 21 years and have been inhabitants of the State for one year, but for the protection of the ballot, citizenship for 90 days, residence in the county for four months, and in the election district for 30 days next preceding the election are required. An absentee voting law, subsequently amended, went into operation in 1919.

The executive and administrative department of New York State is functioning under a reorganization plan, authorized by a constitutional amendment approved in Nov. 1925, which became effective Jan. 1, 1927. Under this system there are 18 major departments to which have been allocated the duties of more than 180 commissions and bureaux. Only the governor, lieutenant governor, comptroller and attorney general are now elected. They are elected biennially (in even-numbered years). The office of secretary of State is now appointive; the duties of the State treasurer were transferred to the division of finance in the department of taxation and finance; while the duties of the State engineer and surveyor were transferred to the division of engineering in the department of public works. The 18 State departments now consist of the executive department, the de-

THE STATE CAPITOL AT ALBANY

partments of audit and control, of taxation and finance, of law, of state, of public works, of conservation, of agriculture and markets, of labour, of education, of health, of mental hygiene, of charities, of correction, of public service, of banking, of insurance and the department of civil service.

The governor submits to the legislature, not later than Jan. 15 (except in the case of a newly elected governor, when the date is extended to Feb. 1), a budget containing a complete plan of proposed expenditures and estimated revenues for the next fiscal year. The budget also contains recommendations of the governor

for new taxes, loans or other appropriate actions to meet any estimated deficiency for the ensuing fiscal year. A bill or item of an appropriation bill that has been vetoed by the governor can become a law only with the approval of two-thirds of the members elected to each house of the legislature. The salary of the governor and of the lieutenant governor, as fixed by an amendment of the Constitution in 1927, is \$25,000 and \$10,000 respectively. The legislative power is vested in a senate of 51 members elected biennially and an assembly of 150 members elected annually. Since 1846 both senators and assemblymen have been elected by single districts, and ever since the State Government was established they have been apportioned according to population, but the present Constitution limits the representation of New York city in the senate by declaring that no county shall have more than one-third of all the senators, nor any two adjoining counties more than one-half of them. The legislature meets in annual sessions, beginning on the first Wednesday in January. Money bills may originate in either house, but at the final vote on such a bill in either house three-fifths of the members elected to that house must be present and the yeas and nays must be recorded; bills entailing appropriations for local or private purposes must receive a two-thirds majority to pass. The legislature appoints the board of regents of the University of the State of New York. The judicial system comprises a supreme court of 112 justices, four appellate divisions of the same, a court of appeals, a court of claims and local courts. The highest judicial court in the State is not, as in most States of the Union, the supreme court, but the court of appeals. This court consists of a chief judge and six associate judges elected from the State at large for a term of 14 years. Its jurisdiction is limited, except where judgment is of death, to a review of questions of law. Vacancies are temporarily filled from among the justices of the supreme court by the governor. To expedite business, at the request of the court, the governor may designate not more than four justices of the supreme court to act temporarily as additional associate judges of the court of appeals. The salary of the chief judge is \$22,500, of the associate judges \$22,000 a year. The justices of the supreme court are elected for 14 years from the nine districts into which the State is divided. The jurisdiction of each justice extends over the entire State. Vacancies are temporarily filled by the governor. The supreme court has general jurisdiction in law and equity, including all actions both civil and criminal. The salary of the justices in the first district and in Kings county of the second district is \$17,500 a year; in the remainder of the second district it is \$16,300 a year; in the other districts it is \$15,000 a year. The State is divided into four departments for each of which there is an appellate division consisting of seven justices in the first and second departments and five in each of the others. The justices and presiding justices are designated from among the justices of the supreme court by the governor; the presiding justice and a majority of the other justices of each department must be residents of the department. The court of claims consists of three judges, one presiding, appointed by the governor for a term of nine years. It has jurisdiction to hear and determine private claims against the State. New York city (*q.v.*) has an extensive judiciary system of its own.

Local Government.—The State is divided into 62 counties, each (unless wholly included in a city) having a county board of supervisors elected for two years, one from every town or city ward. This board has certain administrative and legislative powers. Other county officers are a county judge and a county surrogate elected for a term of six years, except in New York and Kings counties where the term is 14 years, a treasurer, a clerk, a district attorney, a sheriff and from one to four coroners elected for a term of three years. Cities are of three classes, those having a population of: (1) 175,000 or more; (2) between 50,000 and 175,000; and (3) less than 50,000. The classification is according to the latest State enumeration. All city elections are held in odd-numbered years. The organization of cities and villages is provided by the legislature, which may restrict their powers of taxation and of contracting debts and may fix salaries. Town (or township) Government in New York somewhat resembles that

of New England; the chief executive officer of the town is a supervisor, who represents his town in the county "board of supervisors."

Finances.—The aggregate valuation of real and personal property in 1926 was \$22,924,821,772, and on this amount the State levied a tax of one mill on each dollar of valuation. From the State tax on property, for the year ending June 30, 1926 (based on the 1925 valuation and levy), a revenue of \$28,460,191 was collected. The principal sources of State revenue, however, were various special taxes, the chief of which were corporation taxes (\$48,805,970), inheritance taxes (\$22,222,748), motor vehicle licences (\$21,031,569), transfers of shares of stock (\$15,801,074), personal income taxes (\$14,405,068), mortgage taxes (\$6,819,518), corporation organization tax (\$3,573,795) and an insurance premium tax (\$1,811,990). The chief expenditures during the same period were as follows: education, \$48,437,223; construction, \$35,836,335; curative, \$20,166,005; State debt, \$15,758,569; regulative, \$13,525,053; charitable, \$6,626,419; protective, \$4,145,643; and administrative, \$4,036,232. The total general revenue receipts for the year ending June 30, 1926 amounted to \$175,251,768, and the disbursements to \$173,192,425. On the same date the total debt of the State was \$316,825,000. The sinking funds, however, amounted to \$94,959,357, leaving a net State debt of \$221,865,643. Of the total bonded debt, \$152,120,000 were incurred for canals, \$98,000,000 for highways, \$41,400,000 for World War veterans' bonus, \$12,000,000 for the State institutions building fund, \$7,000,000 for forest preserves and \$5,000,000 for the Palisades Interstate park.

In 1851 a State banking department was created, and at the head of this is a superintendent of banks appointed by the governor, with the consent of the senate. This office was continued under the reorganized administrative system which became effective on Jan. 1, 1927. The superintendent—or examiner appointed by him from a civil service list—is required to examine every bank, trust company and other financing institution within the State; national banks excepted. There were 1,144 commercial and savings banks operating within the State on June 30, 1926, and of this total 542 were national banks. These banks had resources of \$17,373,910,000 or 26.9% of the total resources of all banks in the United States. Of the 61 banking institutions in the United States having deposits of \$100,000,000 or more, 33 were in the State of New York.

Education.—The first school was established by the Dutch at New Amsterdam (now New York city) as early as 1633, and at the close of the Dutch period there was a free elementary school in nearly every settlement. King's college was founded in 1754; and from 1704 to 1776 the other schools were principally those maintained by the Society for the Propagation of the Gospel in Foreign Parts. Hardly any schools remained in operation throughout the Revolutionary War. In Jan. 1784 Governor George Clinton recommended legislation for the "revival and encouragement of seminaries of learning," with the result that the legislature passed an act establishing a State university of which Columbia college, formerly King's, was the "mother" portion. In 1787 a second university act was passed which restored to Columbia college the substance of its original charter and made the University of the State of New York an exclusive executive body with authority to incorporate new colleges and academies and to exercise over them the right of visitation. The functions of the university were extended to include an oversight of the professional, scientific and technical schools, the administration of laws relating to admission to the professions, the charge of the State library at Albany, the supervision of the local libraries, the custody of the State museum and the direction of all scientific work prosecuted by the State. This dual system was consolidated by the Educational Unification Act of 1904, in conformity with which the university regents have become a legislative body, subordinate to the State legislature, for determining the general educational policy of the State, and a commissioner of education acts as the chief executive, advisory and supervisory, officer of the whole educational system.

The regents of the university are chosen by the legislature, one retiring each year; and an act of 1909 requires that their number

shall at all times be three more than the number of judicial districts. The commissioner of education is chosen by the regents and continues in office during their pleasure. The commissioner (subject to approval of the regents) appoints three assistant commissioners for higher, secondary and elementary education respectively. The elementary schools are under the general control of district superintendents. The number in a county ranges from five to eight. Any two or more adjoining school districts may unite to form a union free school district, and in any village or union free school district having a population of 4,500 or more the board of education may appoint a superintendent of schools. The total public school enrolment in 1925 was 1,951,160, and the total school expenditures were \$283,506,175. Of the total public school enrolment, 1,641,511 were enrolled in the elementary and kindergarten schools and 309,649 were enrolled in secondary schools. The public schools of the State employed 64,542 teachers. In 1924 there were 125,289 pupils enrolled in the private and parochial schools within the State. School attendance has long been compulsory.

For the training of teachers the State maintains teachers colleges at Albany and Buffalo, and normal schools at Brockport, Cortland, Fredonia, Geneseo, New Paltz, Oneonta, Oswego, Plattsburg and Potsdam. The State controls professional and technical schools through the regents' examinations of candidates for admission to such schools and to the professions, determines the minimum requirements for admission to college by the regents' academic examinations, maintains the large State library and the valuable State museum, and occasionally makes a gift to a college or university for the purpose of maintaining courses in practical industry. Under such an arrangement are maintained the State college of Agriculture and the State college of Home Economics both connected with Cornell university (*q.v.*), at Ithaca; the State agricultural experiment station, at Geneva; the State school of Agriculture at St. Lawrence university, at Canton; the State school of Agriculture at Alfred university at Alfred; the State school of Agriculture at Cobleskill; the State school of Agriculture at Delhi; the State Institute of Applied Agriculture on Long Island at Farmingdale, L.I.; the State school of Forestry at Syracuse university, Syracuse; and the State school of Clay Work and Ceramics at Alfred university, at Alfred.

Among the institutions of higher learning in the State, besides Columbia university (*q.v.*) and Cornell university (*q.v.*), are: Union university at Schenectady; Hamilton college at Clinton; Colgate university at Hamilton; Hobart college at Geneva; Rensselaer Polytechnic Institute at Troy; New York university in New York city; Alfred university at Alfred; Fordham university in New York city; College of the City of New York; University of Rochester at Rochester; Polytechnic Institute of Brooklyn at Brooklyn; Niagara university at Niagara Falls; St. Lawrence university at Canton; St. Bonaventure's college at Allegheny; Long Island university at Brooklyn; Manhattan college at New York city; Vassar college (*q.v.*), at Poughkeepsie; St. John's college at Brooklyn; Canisius college at Buffalo; Syracuse university at Syracuse; Adelphi college at Brooklyn; Clarkson college of Technology at Potsdam; St. Rose's college at Albany; Wells college at Aurora; St. Francis college at Brooklyn; D'Youville college at Buffalo; St. Joseph's college for Women at Brooklyn; University of Buffalo at Buffalo; Elmira college at Elmira; Houghton college at Houghton; Keuka college at Keuka Park; College of New Rochelle at New Rochelle; College of Mount St. Vincent at New York city; College of the Sacred Heart at New York city; Cooper Union at New York city; Hunter college of the City of New York; Skidmore college at Saratoga Springs; Marymount college at Tarrytown; Russell Sage college at Troy; and Good Counsel college at White Plains. The United States Military academy (1802) is at West Point.

Charities and Corrections.—Penal institutions are under the supervision of the department of correction; schools for mental defectives and hospitals for the insane, except for the criminal insane, are under the supervision of the department of mental hygiene; and all other charitable and correctional institutions,

maintained wholly or in part by the State, except the State camp for veterans at Bath which is under the control of the executive department, are under the supervision of the department of charities. At the head of the department of corrections is the commissioner of correction, appointed by the governor with the consent of the senate for a term equal to that of the appointing governor. The division of parole consists of the commissioner of correction and of two members appointed by the governor for a term of five years. The duties of visitation and inspection are vested in the State commission of correction composed of seven members appointed by the governor for four years and the commissioner of correction. The institutions under this department in 1927 were as follows: Auburn prison at Auburn; Clinton prison at Dannemora; Great Meadow prison at Comstock; Sing Sing prison at Ossining; hospitals for the criminal insane at Dannemora and Matteawan; New York State reformatory at Elmira; the State training school at Albion; New York State reformatory for women at Bedford Hills; and the Institute for defective delinquents at Napanoch.

At the head of the department of mental hygiene is the commissioner of mental hygiene appointed by the governor with the consent of the senate. He holds office during the term of the appointing governor, and receives an annual salary of \$12,000. In 1927 the department of mental hygiene had supervision over the following institutions: State schools for mental defectives at Newark, Rome, Syracuse, Letchworth Village (Thiells); the Craig Colony (epileptics) at Sonyea; and hospitals for the insane at Binghamton, Brooklyn, Buffalo, Central Islip, Helmsuth (the Gowanda Homeopathic), Wingdale (the Harlem Valley), Poughkeepsie, Kings Park, New York (the Manhattan), Middletown (Homeopathic), Rochester, Ogdensburg (St. Lawrence), Utica and Willard.

The State department of charities consists of a State board of charities of 12 members, one member from each of the nine judicial districts and three additional members for the City of New York, all appointed by the governor with the consent of the senate for a term of eight years. The board appoints a chief executive officer with the title of director of State charities. In 1927 the State charitable institutions were as follows: State training school for girls, Hudson; State agricultural school, Industry; Thomas Indian school, Iroquois; State Woman's Relief Corps Home, Oxford; Hospital for Treatment of Incipient Pulmonary Tuberculosis, Raybrook; and Orthopaedic hospital for children, West Haverstraw. The House of Refuge, Randalls Island, is supported in part by the State and is subject to visitation by the department of charities. The State Institute for the Study of Malignant Diseases, located at Buffalo, is under the control of the department of health. Facilities for educating the blind are provided by the State school for the blind at Batavia and by private institutions where pupils are maintained on a *per caput* basis. The deaf and dumb are educated in private institutions, exclusively. Such pupils as are appointed by the commissioner of education, are maintained by the State. The condition of several of these State institutions was so unsatisfactory that in the spring of 1929 Governor Roosevelt advocated an issue of \$50,000,000 bonds to provide for their renovation.

Agriculture and Stock-raising.—Although New York has lost in the competition with the Western States in the production of most of the grains, especially wheat, barley and Indian corn, and in the production of wool, mutton and pork, it has steadily progressed in the dairy business and continues to rank first as a hay producing State. It has made great advances, too, in the production of flowers, ornamental plants, nursery products, fruits, vegetables, poultry and eggs. The farm acreage in 1925 was 19,269,926 or 63.2% of the State's total land area. Of this total, 9,087,663 ac. were classified as crop land, and 8,290,335 ac. produced crops for harvest. The number of farms steadily decreased from 226,720 in 1900 to 188,754 in 1925. The average acreage per farm, in the latter year, was 102.1, a slight increase from the 99.9 ac. in 1900. More than 85% of the farms were operated by owners or part owners. The total value of all farm property decreased between 1920-25 from \$1,908,483,202 to \$1,706,929,770.

Of the total acreage of all farm crops in 1926, 4,915,000 (59.3%) were of hay and 2,376,000 (28.6%) were of cereals. In the amount of the hay crop (6,469,000 tons) and in value (\$96,708,000), New York ranked first among the States of the Union. In 1926 4,887,000 bu. of wheat; 23,450,000 bu. of Indian corn; 34,578,000 bu. of oats; 5,066,000 bu. of barley; 3,837,000 bu. of buckwheat; 434,000 bu. of rye; 1,145,000 bu. of dry beans; 29,016,000 bu. of potatoes; 2,200,000 lb. of tobacco; 40,375,000 bu. of apples; 2,300,000 bu. of peaches; 2,088,000 bu. of pears; 9,571,000 qt. of strawberries; and 106,700 tons of grapes were

RELATIVE IMPORTANCE OF NEW YORK STATE IN CERTAIN ASPECTS OF THE NATIONAL LIFE

produced. New York ranked first among the States in the production of buckwheat; second in the production of grapes and of commercial apples; third in the production of dry beans; and fourth in the production of potatoes and of pears. It has a larger acreage of vegetables than any other State of the Union. The State is a large producer of onions, green peas, green (snap) beans, cauliflower, celery, cabbages, carrots, lettuce, tomatoes, turnips, sweet corn, cucumbers, rhubarb and parsnips. The culture of small fruit and vegetables is widely distributed throughout the western half of the State and in the valley of the Hudson, and the greater part of Long Island under cultivation is devoted to market gardening, floriculture and nurseries. The total value of the fruit crop in 1926 was second only to that of California. The greater orchards are in the tier of counties bordering the south shore of Lake Ontario and in Dutchess and Ulster counties in the Hudson valley. Chautauqua county is the chief producer of grapes, but this fruit is grown extensively in the region west of Seneca lake in the vicinity of Lake Keuka, and in parts of the lower valley of the Hudson. The dairy business and the production of hay are especially prominent in the upper valley of the Hudson, in the rugged regions west of the Adirondack mountains and in the rugged portions of the counties in the southern half of the State. According to the 1925 census of agriculture, 741,983,208 gal. of milk were produced in 1924, and all dairy products had a value of \$118,303,772. In 1924 there were 370,970 sheep shorn, and the wool production was 2,699,164 lb., worth \$1,174,698. The egg production (87,167,262 dozen) and the number of chickens raised (14,940,905) had a total value of \$48,453,508. The value of all live stock within the State, according to the 1925 census of agriculture, was \$170,419,127.

Minerals.—More than 30 mineral substances are obtained in commercial quantities from the mines, quarries and wells of New York, but, because of the absence of coal and of petroleum in large quantities, it produced only 2.05% of the mineral wealth of the United States in 1925. New York then ranked 14th among the States of the Union. The total value of the mineral products in 1925 was \$102,035,557. The table below shows the principal products and their values in that year.

Product	Quantity	Value
		\$
Clay products		24,550,751
Gypsum, short tons	1,731,254	16,219,906
Cement, barrels	8,534,089	14,967,042
Stone, short tons	8,869,200	12,358,238
Sand and gravel, short tons	14,966,616	9,750,433
Salt, short tons	2,053,970	7,133,244
Petroleum, barrels	1,695,000	6,270,000
Natural gas, M. cu. ft.	6,210,000	3,778,000
Iron ore, long tons	413,517	1,988,735
Lime, short tons	104,829	1,030,960
Talc, " "	85,100	903,913
Zinc, " "	5,158	784,016

New York ranked first among the States in the production of gypsum, talc, sand and gravel, emery, abrasive garnet and magnesium; second in salt; fourth in cement; and fifth in clay products.

Manufactures.—The establishment of a great highway of commerce through the State from New York city to Buffalo by the construction of the Erie canal, opened in 1825, and later by the building of railways along the line of the water route, made the State's manufactures quite independent of its own natural resources. Thus it happens that from Buffalo to New York city there is a chain of busy manufacturing centres; but away from the great natural route of commerce New York is not especially noteworthy either for its density of population or for extensive manufacturing and commerce.

New York State has ranked first in the Union in the value of its manufactures since 1830, and this value rose to \$8,968,547,839 in 1925. The value (\$5,324,413,612) of the products of the manufactures of New York city alone represented approximately 60% of the total. The manufacture of clothing, begun in New York city about 1835, was not only the city's chief product but was also the principal product of the State. The value of the clothing produced within New York city was \$1,388,305,548 in 1925. New York city, also, ranked first among the American cities in printing and publishing (\$463,838,101); fur goods (\$194,803,213); millinery and lace goods (\$194,494,559); bakery products (\$181,173,270); knit goods (\$86,212,313); jewellery (\$57,415,232); and confectionery and ice cream (\$51,239,959). Buffalo, the city second in manufactures, shares largely with New York city the business of slaughtering and meat-packing, the refining and smelting of copper, and the manufacture of foundry and machine-shop products. It is the principal centre for the manufacture of flour and grain, mill products and for the motor vehicle industry. Rochester, the city third in manufactures, was first among the cities of the United States in the manufacture of photographic materials and apparatus and optical instruments. Niagara Falls and New

MEN'S CLOTHING:		TOTAL VALUE	\$1,087,237,742

PROPORTION OF TOTAL U.S. OUTPUT OF MEN'S CLOTHING AND WOMEN'S CLOTHING MANUFACTURED IN NEW YORK, 1925

York city manufactured a large part of the chemicals. Cities, other than those already mentioned, with products valued at more than \$100,000,000 in 1925* were: Syracuse, Yonkers and Schenectady.

The number of industrial establishments, which reported products over \$5,000 in 1925, was 33,393. The 1,066,202 wage-earners in 1925 received \$1,533,893,390 in wages. The industries with products valued at more than \$100,000,000 in 1925 were: clothing, \$1,495,741,841; printing and publishing, \$548,304,377; foundry and machine shop, \$257,655,999; bread and bakery products, \$248,166,437; furniture, \$155,826,177; motor vehicles, \$155,647,

161; flour and grain mill products, \$151,599,561; paper and wood pulp, \$141,396,762; electrical machinery, \$239,262,117; slaughtering and meat packing, \$233,901,277; fur goods, \$197,437,970; millinery and lace goods, \$197,324,664; boots and shoes, \$191,375,288; knit goods, \$183,233,931; sugar refining, \$164,515,037; chemicals, \$132,658,955; cigars and cigarettes, \$122,613,390; silk, \$112,156,313; food preparations, \$111,134,193; steel works and rolling mills, \$107,059,150; motor vehicle bodies and parts, \$105,798,733; gas, manufactured, \$102,859,050.

Transport and Commerce.—From the very beginning of the occupation of New York by Europeans, commerce was much encouraged by the natural water-courses. The Erie canal was opened to boats of about 75 tons burden in 1825. The Champlain canal, connecting the Erie with Lake Champlain, was completed in 1823. The Oswego canal, connecting the Erie with Lake Ontario, was begun in 1825 and completed in 1828. Several other tributary canals were constructed during this period, and between 1836 and 1862 the Erie was sufficiently enlarged to accommodate boats of 240 tons burden.

The first railway in the State and the second in operation in the United States was the Mohawk and Hudson, opened from Albany to Schenectady in 1831. The first great trunk line in the country was that of the Erie railway, opened from Piermont, on the Hudson river, to Dunkirk, on Lake Erie, in 1853. The New York Central railway, nearly parallel with the water route from New York city to Buffalo, was formed by the union, in 1869, of the New York Central with the Hudson River railway. In 1886 the New York Central Railroad company leased the West Shore railway for a term of 475 years, and this company operates another parallel line from Syracuse to Buffalo, a line following closely the entire north border of the State, and several cross lines. Other important railways are the Lehigh Valley, the Delaware, Lackawanna and Western, and the Pennsylvania in the central and western sections, the Delaware and Hudson, the Rutland, the Boston and Maine, the Central New England and the New York, Ontario and Western in the east, and the Long Island on Long Island. In 1925 the operated steam railway mileage in New York was 8,373. In the same year there were 5,428 m. of electric railways operated by 86 companies. The road mileage in the State highway system on Dec. 31, 1926 was 14,068, of which 9,854 were surfaced. In the mileage of surfaced road, New York ranked first among the States. In competition with the railways, traffic on the existing canals suffered a marked decline. As this decline was accompanied with a considerable decrease in the proportion of the country's export which passed through the port of New York, interest in the canals revived, and in 1903 the electorate of the State authorized the issue of bonds to the amount of \$101,000,000 for the purpose of increasing the capacity of the Erie, the Champlain and the Oswego canals, to make each navigable to barges of 1,000 tons burden.

The project adopted by the State for the enlargement of the Erie provided for a new route up the Hudson from Troy to Waterford and then to the Mohawk river above the Cohoes falls. The improvement projects were completed in 1918. In addition to the canalized rivers and lakes (382 m.) the State has a canal mileage of 525. Of the total tonnage (2,369,367) moved on the State's barge canals in 1926, 1,935,278 tons were on the Erie division. The water-borne commerce of New York State in 1926 consisted of 15,584,288 cargo tons in imports and 12,242,446 cargo tons in exports. Of this total, the Great Lakes contributed 3,993,220 tons in imports and 1,691,207 tons in exports. The imports to the port of New York decreased from \$2,892,621,000 in 1920 to \$2,224,964,000 in 1926, while the exports decreased in value from \$3,283,873,000 to \$1,662,538,000. Buffalo was by far the most important of the Great Lakes ports.

HISTORY

The aboriginal inhabitants of New York had an important influence on its colonial history. Within its limits from the upper Hudson westward to the Genesee river was the home of that powerful confederacy of Indian tribes the Mohawks, Oneidas, Onondagas, Cayugas and Senecas, known to the French as the

Iroquois and to the English as the Five (later Six) Nations. When supplied with firearms by Europeans they reduced a number of other tribes to subjection and extended their dominion over most of the territory from the St. Lawrence to the Tennessee and from the Atlantic to the Mississippi. They were at the height of their power about 1700. Of much less influence in New York were several Algonkin tribes in the lower valley of the Hudson and along the sea coast.

Early Dutch Traders and Colonists.—New York bay and the Hudson river were discovered by Giovanni da Verrazano in 1524, and were probably seen by Esteban Gomez in 1525; for many years following, French vessels occasionally ascended the Hudson to trade with the Indians. The history of New York really begins, however, in 1609. In July of that year Samuel de Champlain discovered the lake which bears his name and on its shores led his Algonkin Indian allies against the Iroquois, thus provoking against his countrymen the hostility of a people who for years were to hold the balance of power between the English and the French in America. On Sept. 3 Henry Hudson, in the employ of the Dutch East India company, entered New York bay in the "Half Moon" in search of the "northwest passage." He conceived that a vast trade with the Iroquois for furs might be established. His report aroused great interest in Holland, and the United Netherlands, whose independence had been acknowledged in the spring, claimed the newly discovered country. In 1610 a vessel was despatched with merchandise suitable for traffic with the Indians, the voyage resulted in profit, and a lucrative trade in peltries sprang up. Early in 1614 Adriaen Block explored Long Island sound and discovered Block island. The merchants of Amsterdam and Hoorn soon formed themselves into the New Netherland company, and on Oct. 10, 1614, received from the States-General a three years' monopoly of the Dutch fur trade in New Netherland; *i.e.*, that part of America between New France and Virginia or between latitudes 40° and 45° north. Late in the same year or early in 1615 a stockaded trading post called Ft. Nassau was erected on Castle Island, now within the limits of Albany, and a few huts were erected about this time or earlier on the southern extremity of Manhattan island; but no effort at colonization was as yet made. On the expiration of the charter of the New Netherland company (1618) the States-General refused to grant a renewal, and only private ventures were authorized until 1621. When the West India company was first chartered for a term of 24 years, to it was given a monopoly of Dutch trade with the whole American coast, authorized to plant colonies and to govern them under a very limited supervision of the States-General. In June, 1623, however, New Netherland was formally erected into a province and the management of its affairs assigned to the chamber of Amsterdam, which in March, 1624, despatched the "New Netherland," with the first permanent colonists (30 families mostly Walloon), under Cornelis Jacobson Mey, the first governor or director of the colony. Arriving at Manhattan early in May, a few of the men remained there, but more than one-half of the families proceeded up the Hudson to Ft. Orange, and there founded what is now Albany. Three more vessels arrived in 1625, and when in that year Mey was succeeded as director by William Verhulst the colony had a population of 200 or more. The Government of the province was fully established in 1626 and was vested mainly in a director general and council. Peter Minuit, the first director general, arrived with more colonists in May, 1626, and soon afterwards Manhattan island was bought from the Indians, Ft. Amsterdam was erected at its lower end, and the settlement here was made the seat of Government.

In 1629, mainly to promote agriculture, the company issued its famous charter of privileges and exemptions, which provided that any member might have anywhere in New Netherland except on Manhattan island his choice of a tract of unoccupied land extending 16 m. along the seacoast or one side of a navigable river, or 8 m. along the river on both sides "and so far into the country as the situation of the occupiers will permit" by purchasing the same from the Indians and planting upon it a colony of 50 persons, within four years from the beginning of the undertaking, and that

any private person might with the approval of the director general and council take up as much land as he should be able to improve. The founder of a colony was styled a *patroon*, and, although the colonists were bound to him only by a voluntary contract for specified terms, the relations between them and the patroon during the continuance of the contract were in several important respects similar to those under the feudal system between the lord of a manor and his vassals. The single colony of Rensselaerwyck established by Kilian van Rensselaer on both sides of the Hudson and extending in all directions from Ft. Orange (Albany), was the only one that prospered under the patroon system. In the meantime the patroons had claimed unrestricted rights of trade within the boundaries of their estates. These were stoutly denied by the company. Director-general Minuit was recalled in 1632 on the ground that he had been partial to the patroons; and Wouter van Twiller, who arrived in 1633, endeavoured to promote only the selfish commercial policy of the company; at the close of his administration (1637) the affairs of the province were in a ruinous condition.

William Kieft was appointed director-general late in 1637, and in 1638 the company abandoned its monopoly of trade in New Netherland and gave notice that all inhabitants of the United Provinces, and of friendly countries, might trade there subject to an import duty of 10%, an export duty of 15%, and to the requirement that the goods should be carried in the company's ships. At the same time the director-general was instructed to issue to any immigrant applying for land a patent for as large a farm as he required for cultivation and pasturage, to be free of all charges for ten years and thereafter subject only to a quit-rent of one-tenth of the produce. Two years later, by a revision of the charter of privileges and exemptions, the prohibition on manufactures was abolished, the privileges of the original charter with respect to patroons were extended to "all good inhabitants of the Netherlands," and the estate of a patroon was limited to four miles along the coast or a navigable river and eight miles back into the country. These inducements encouraged immigration not only from the Fatherland but from New England and Virginia. But the freedom of trade promoted dangerous relations with the Indians, and an attempt of Kieft to collect a tribute from the Algonkin tribes in the vicinity of Manhattan island and other indiscretions of this officer provoked Indian hostilities (1641-45), during which most of the outlying settlements were laid waste.

Out of this warfare arose an organized movement for a Government in which the colonists should have a voice. In Aug. 1641, Kieft called an assembly of the heads of families in the neighbourhood of Ft. Amsterdam to consider the question of peace or war. The assembly chose a board of 12 men to represent it, and a few months later this board demanded certain reforms, but Kieft later denied its authority to exact promises from him, and dissolved it. At another crisis in 1643, he was obliged to call a second assembly of the people. This time a board of eight men was chosen to confer with him. It denied his right to levy certain war taxes, and when it had in vain protested to him against his arbitrary measures it sent a petition, in 1644, to the States-General for his recall, and this was granted. Peter Stuyvesant (*q.v.*), his successor, arrived at Ft. Amsterdam in May, 1647. Under his rule there was a return of prosperity; from 1653 to 1664 the population of the province increased from 2,000 to 10,000. Stuyvesant was, however, extremely arbitrary. Although he permitted the existence of a board of nine men to act as "tribunes" for the people he treated it with increasing contempt.

English Occupation.—Notwithstanding the good claim to their province which the Dutch had established by discovery and occupancy, the Government of Great Britain, basing its claim to the same territory on Cabot's discovery (1498), the patent to the London and Plymouth companies (1606), and the patent to the Council for New England (1620), contended that the Dutch were intruders, and by the Treaty of Hartford (1650), the commissioners of the United Colonies of New England forced Stuyvesant to agree to a boundary which on the mainland roughly determined the present boundary between New York and Connecticut and on Long Island extended from Oyster bay to the Atlantic ocean. In

1653, the Dutch, fearing an English attack, built a wall, from which the present Wall street was named, across Manhattan island at what was then the northern limits of New Amsterdam. In March 1664, Charles II. formally erected into a province the whole territory from the west side of the Connecticut river to the east side of Delaware bay together with the whole of Long Island and granted it to his brother James, the duke of York and

OLD FORT NIAGARA, SHOWING RAMPARTS AND HISTORIC BUILDINGS
Fort Niagara, located a short distance from Niagara Falls, was a gateway to the West in frontier days. In the right background is the French castle, built in 1726. The bakehouse, beside it, was erected by the English in 1762. In the foreground is the English blockhouse, dating from 1771-73

Albany, as its lord proprietor. The duke appointed Col. Richard Nicolls governor and placed him in command of an expedition to effect its conquest. Nicolls won over the burgomaster of New Amsterdam and other prominent citizens by the favourable terms which he offered, and Stuyvesant was forced, without fighting, into a formal surrender on Sept. 8. The duke's authority was proclaimed and New Netherland became New York. Among numerous changes from Dutch to English names was that from Ft. Orange to Ft. Albany. A treaty of alliance with the Mohawks and Senecas procured for the English the same friendly relations with the Iroquois that the Dutch had enjoyed. The transition from Dutch to English institutions was effected gradually and the private rights of the Dutch were carefully preserved. The introduction of English institutions into settlements wholly or largely English was begun in 1665 by the erection of Long Island, Staten Island and Westchester into an English county under the name of Yorkshire, and by putting into operation in that county a code of laws known as the "Duke's Laws." It gave the freeholders of each town a voice in the government of their town by permitting them to elect a board of eight overseers and a constable. The board sat as a court for the trial of small causes. Nicolls resigned the governorship in 1668, but his successor, Francis Lovelace, continued his policy—autocratic government, arbitrary in form but mild in practice, and progressive in the matter of religious toleration.

In Aug. 1673, Holland and England being at war, a Dutch fleet surprised New York, captured the city, restored Dutch authority and the names of New Netherland and New Orange. But by the Treaty of Westminster, Feb. 1674, the Dutch title to the province was finally extinguished, and in November the English again took possession. In 1675 Governor Andros established at Albany a commission for Indian affairs which long rendered important service in preserving the English-Iroquois alliance. The imperious manner of Andros made him many enemies. Some of them preferred charges against him relating to his administration of the revenue. He was called to England in 1681 to answer these, and during his absence the demand for a representative assembly was accompanied by a refusal to pay the customs duties and so much other insubordination that the duke appointed Col. Thomas Dongan to succeed Andros, and instructed him to call the desired assembly. It met at Ft. James in the City of New York on Oct. 17, 1683, was in session for about three weeks, and passed 15 acts. The first, styled a charter of liberties and privileges, required that an assembly elected by the freeholders and freemen should be called at least once every three years; vested all legislative authority in the governor, council and assembly; forbade the imposition of any taxes without the consent of the assembly; and provided for religious liberty and trial by jury.

The king, in an attempt to strengthen the imperial control over New England as well as to erect a strong barrier against the French, in 1688 consolidated New York and New Jersey with the New England colonies into the Dominion of New England and placed it under the viceregal authority of Sir Edmund Andros as governor-general. The news of the English revolution of 1688, however, caused an uprising in Boston, and in April 1689 Andros was seized and imprisoned. The fall of Andros encouraged a number of the restless spirits, especially in the City of New York and on Long Island to take matters into their own hands. They found a leader in a German merchant, Jacob Leisler (*q.v.*). On May 31, 1689, the militia captains seized Ft. James and Leisler assumed command later. In the following month Nicholson, the lieutenant-governor, deserted his post and sailed for England, and Leisler easily gained possession of the city. He called an assembly which conferred upon him the powers of a dictator. Some time after a copy of the order of the new monarchs (William and Mary) to continue all Protestants in their offices in the colonies had been received, Leisler falsely announced that he had received a commission as lieutenant-governor. Albany defied his usurped authority until his recognition was necessary to present a united front against the French and their Indian allies, who, in Feb. 1690, had surprised and burned Schenectady. French attacks had at the same time been directed against New England, and to meet the dangerous situation Leisler performed the one statesmanlike act of his public career, notable in American history as the first step toward the union of the colonies. At his call, delegates from Massachusetts, Plymouth, Connecticut and Maryland met in New York city with delegates from New York on May 1, 1690 to consider concerted action against the enemy, although the expedition which they sent out was a failure. Leisler had proclaimed the new monarchs of Great Britain and had declared that it was his purpose only to protect the province and the Protestant religion until the arrival of a governor appointed by them, but he was enraged when he learned that he had been ignored and that Col. Henry Sloughter had been appointed as the new governor. Leisler refused to give up the fort, and after some bloodshed was arrested and executed. The execution was regarded by many as an act of revenge, and for many years the province was rent by the Leislerian and anti-Leislerian factions.

Governor Sloughter, as his commission directed, re-established in 1691 the assembly which James II. had abolished in 1686, and throughout the remainder of the colonial era the history of the province relates chiefly to the rise of popular Government and the defence of the northern frontier. Until Gov. Cornbury's administration (1702-08) both the Leislerians and the anti-Leislerians repeatedly bid for the governor's favour by supporting his measures instead of contending for popular rights. But Cornbury's embezzlement of £1,500, appropriated for fortifying the Narrows connecting upper and lower New York bay, united the factions against him and started the assembly in the important contest which ended in the establishment of its control over the public purse. In 1706 it won the right to appoint its own treasurer to care for money appropriated for extraordinary purposes, and in 1737 the custom of continued revenue acts was replaced by annual appropriations.

The first newspaper of New York, the *New York Gazette*, was established in 1725 by William Bradford, as a semi-official organ of the Administration. In 1733 a popular organ, the *New York Weekly Journal*, was established under John Peter Zenger (1697-1746), and in 1735 both the freedom of the press and a great advance towards the independence of the judiciary were the outcome of a famous libel suit against Zenger. He was arrested for libel in Nov. 1734 for printing criticisms of the administration. When his counsel, James Alexander (1696-1756) and William Smith (1679-1769), took exception to the commissions of the chief justice, James de Lancey (1703-60) and one of his associates, because by these commissions the justices had been appointed "during pleasure" instead of "during good behaviour," the chief justice disbarred them. Their places, however, were taken by Andrew Hamilton, speaker of the assembly of Pennsyl-

vania and a lawyer of great reputation in the English colonies. The jury quickly agreed on a verdict of not guilty, and the acquittal was greeted by the populace with shouts of triumph. The further independence of judges became a leading issue in 1761 when the assembly insisted that they should be appointed during good behaviour, and refused to pay the salaries of those appointed during pleasure; but the home Government met this refusal by ordering that they be paid out of the quit-rents.

The Defence of the Northern Frontier was a heavy burden to New York, but by its problems the growth of the union of the colonies was promoted. The main effort of the French, however, was, by diplomacy, to destroy the English-Iroquois alliance. To counteract the influence of French priests dwelling among the Iroquois, the English, in 1701, prevailed upon the chiefs to deed their territory, said to be 800 m. in length and 400 m. in breadth, to the king of England. The English, also, frequently distributed presents. But the success of the French at the close of the 17th century and the early portion of the 18th was prevented only by the ceaseless efforts of Peter Schuyler (1657-1724) whose personal influence was for years dominant among all the Iroquois except the Senecas. When they had assumed a neutral attitude, he persuaded a number of them to join troops from New York, New Jersey and Connecticut in the unsuccessful expeditions of 1709 and 1711 against the French at Montreal. In order to regulate the trade with the Iroquois, Governor Burnet established a trading post at Oswego in 1722 and fortified it in 1727 and thereby placed the Iroquois in the desirable position of middlemen in a profitable fur trade with the "Far Indians." In King George's war New York was left alone to protect its own frontier and while the assembly was wrangling with Governor Clinton for the control of expenditures the French and their Indians were burning farm houses, attacking Saratoga (Nov. 17, 1745), and greatly endangering the English-Iroquois alliance. A reconciliation was effected, however, by Col. (later Sir William) Johnson (*q.v.*), a former agent of Indian affairs. Largely to secure the co-operation of the Iroquois the home Government itself now called the most important assembly of colonial deputies that had yet gathered to meet at Albany (*q.v.*). This body, consisting of 23 commissioners and representing seven colonies, met in June 1754, and, besides negotiating successfully with the Iroquois, it adopted, with some modifications, a plan of colonial union prepared by Benjamin Franklin; the plan was not approved, however, either by the home Government or by any of the colonies. In the first year of the French and Indian war (1755) Maj.-Gen. William Johnson defeated a French and Indian force under Baron Dieskau in the battle of Lake George. In Aug. 1756 Montcalm took Oswego from the English and destroyed it, and in 1757 he captured Ft. William Henry; but in the latter year the elder Pitt assumed control of affairs in England, and his aggressive, clear-sighted policy turned the tide of war in England's favour. Victory followed victory. Ticonderoga, Crown Point and Niagara were wrested from the French and New York was freed of its foes.

The Revolutionary War.—England's attempt to make the colonies pay the expenses of the war by means of the stamp tax thoroughly aroused the opposition of commercial New York, already chafing under the hardships imposed by the Navigation Acts and burdened with a war debt of its own exceeding £300,000. The assembly authorized its committee, which had been appointed to correspond with the New York agent in London, to correspond also with the committees in the other colonies and this committee represented New York in the Stamp Act Congress, which met in New York city in Oct. 1765. In the series of events which followed important changes were made in party lines. The court party and propertied classes became the Loyalist Party, standing for law as against rebellion, monarchy and the union of the empire as against republicanism; the popular party became the Patriot Party, determined to stand on its rights at any cost. The Stamp Act was repealed in March 1766, but the Townsend acts were met in New York by fresh outbursts of the Sons of Liberty and, by an association of merchants, the members of which pledged themselves not to import anything from England until the duties were repealed. New York had also been requested to provide

certain supplies for the British troops quartered in the city. This the assembly refused to do but parliament answered (1767) by forbidding it to do any other business until it complied. It was under these conditions that the Loyalists, in the elections of 1768 and 1769, gained control of the assembly and in the latter year passed an act granting the soldiers' supplies. The moderate Loyalists joined in the election of delegates to the first Continental Congress; but the great body of Loyalists in New York strongly disapproved of the "dangerous and extravagant" measures adopted by that body, and the assembly, in Jan. 1775, refused to approve its acts or choose delegates to the second Continental Congress. The Patriots met this refusal by calling a provincial convention to choose the delegates. Scarcely had they done this when news of the encounter at Lexington produced a strong reaction in their favour, and in May 1775 they called a Provincial Congress which usurped the powers of the assembly. Still, conditions were such in New York that a fight for independence was not to be lightly considered. In the south the chief city was exposed to the British fleet, and the northern border was exposed to attack from the British and their Iroquois allies. In various sections, too, considerable numbers of Loyalists were determined to aid the British. When, in June 1776, a vote on the Declaration of Independence was pending in the Continental Congress, the New York Provincial Congress refused to instruct its delegates in the matter; but a newly elected Provincial Congress, influenced by a Loyalist plot against the life of Washington, adopted the Declaration when it met, July 9.

It was a settled point of British military policy throughout the war to hold New York city, and from it, as a base, to establish a line of fortified posts along the Hudson by means of which communication might be maintained with another base on Lake Champlain. Such a scheme, if successfully carried out, would have driven a wedge into the line of colonial defence and cut off communication between New England and the southern colonies. A few days after the fight at Lexington and Concord, Connecticut authorized an expedition under Ethan Allen which surprised and captured Ticonderoga and Crown Point. In the following year (1776) the British began their offensive operations for the control of the Hudson. Sir William Howe, with a force of British and Loyalists vastly superior in equipment and numbers to Washington's untrained militia, landed in July on Staten Island and late in August defeated Washington at the battle of Long Island within the present limits of Brooklyn borough. In the following month Washington withdrew from New York city which the British entered and held until the close of the war. Washington prepared to withstand the British behind fortifications on Harlem Heights, but discovering that Howe was attempting to outflank him by landing troops in the rear he retreated to the mainland, leaving only a garrison at Ft. Washington, and established a line of fortified camps on the hills overlooking the Bronx river as far as White Plains. This brought on the battle of White Plains late in October, in which Howe gained no advantage; and from here both armies withdrew into New Jersey, the British capturing Ft. Washington on the way. In 1777 General John Burgoyne succeeded in taking Ticonderoga, but in the swampy forests southward from Lake Champlain he fought his way against heavy odds, and in the middle of October his campaign culminated disastrously in his surrender at Saratoga. Col. Barry St. Leger led an auxiliary expedition from Oswego against Ft. Stanwix on the upper Mohawk, and on Aug. 6 he fought at Oriskany one of the most bloody battles of the war, but a few days later, deserted by his terror-stricken Indian allies, he hastened back to Montreal. Early in October Howe sent an expedition up the Hudson under the command of Sir Henry Clinton. Clinton met with little difficulty from the principal American defences of the Highlands, consisting of Fts. Montgomery and Clinton on the western bank, together with a huge chain and boom stretched across the river to a precipitous mountain (Anthony's Nose) on the opposite bank, and ascended as far as Esopus (now Kingston) which he burned, but he was too late to aid Burgoyne. The year 1778 saw the bloody operations of the Tory Butlers and their Loyalist and Indian allies in the Mohawk and Schoharie valleys and notably the massacre at

Cherry valley. In retaliation a punitive expedition under Generals John Sullivan and James Clinton in 1779 destroyed the Iroquois towns, and dealt the Indian confederacy a blow from which it never recovered. The American cause was strengthened this year also by several victories along the lower Hudson of which General Anthony Wayne's storming of the British fort at Stony Point was the most important. The closing episode of the war as far as New York was concerned was the discovery of Benedict Arnold's attempt in 1780 to betray West Point and other colonial posts on the Hudson to the British. On Nov. 25, 1783, the British forces finally evacuated New York city, but the British posts on Lakes Erie and Ontario were not evacuated until some years later.

New York ratified the Articles of Confederation in 1778, and when Maryland refused to ratify unless those States asserting claims to territory west to the Mississippi agreed to surrender them, New York was the first to do so. But under the leadership of George Clinton, governor in 1777-95, the State jealously guarded its commercial interests. This led to determined opposition to the new Federal Constitution. In support of the Constitution, however, there arose the Federalist party under the able leadership of Alexander Hamilton. When a majority of the Constitutional Convention of 1787 had approved of the new Constitution, Hamilton alone of the three New York delegates remained to sign it; and when, after its ratification by eight States, the New York Convention met at Poughkeepsie (June 17, 1788) to consider ratification, two-thirds of the members were opposed to it. But others were won over by the news that it had been ratified by New Hampshire and Virginia or by the telling arguments of Hamilton, and on July 26 the motion to ratify was carried by a vote of 30 to 27.

Elections and Legislation.—The Constitution having been ratified, personal rivalry among the great families—the Clintons, the Livingstons and the Schuylers—again became dominant in political affairs. The Livingstons, piqued at Washington's neglect to give them the offices they thought their due, joined the Clintons, but the Federal patronage was used against the anti-Federalists or Republicans with such effect that in 1792 John Jay received more votes for the governorship than George Clinton, although the latter was counted in on a technicality. Jay was elected in 1795 and re-elected in 1798, but in 1801 the brief Federalist *régime* in the State came to an end with the election of George Clinton for a seventh term. The Republican leaders straightway quarrelled among themselves, thus starting the long series of factional strifes which have characterized the party politics of New York State. The leaders of the several Republican groups were Chancellor Robert R. Livingston, Aaron Burr, then vice-president, Governor George Clinton and his nephew, De Witt Clinton, who in 1802 was elected United States senator. The first break came in the spring of 1804 when Burr, who had incurred the enmity of his Republican colleagues in 1800 by seeking Federalist votes in the electoral college at Jefferson's expense, became an independent candidate for the office of governor against Morgan Lewis. Hamilton's action in counselling Federalists not to vote for Burr just as he had counselled them not to support Burr against Jefferson in 1800, was one of the contributory causes of Burr's hostility to Hamilton which ended in the duel (July 1804) in which Burr killed Hamilton. Hamilton's death marked the end of the Federalists as a power in New York. New York, whose growing shipping interests had suffered by the Embargo of 1807, was as a commercial State opposed to the war of 1812 with Great Britain. Politically this opposition had the effect of temporarily reviving the Federalist Party, which secured control of the legislature, and gave the electoral vote of the State in 1812 to De Witt Clinton, whom the Federalists had accepted as a candidate to oppose Madison for re-election on the war issue. During the war New Yorkers served with the regular troops at Niagara, Plattsburg and other places on the western and northern frontiers of the State. For some years after the war political contests in New York State as in the rest of the country were not on party lines. De Witt Clinton was elected governor and, largely through his efforts, the Erie canal was begun.

The election of Martin Van Buren as governor in 1828 marked

the beginning of the long ascendancy in the State of the "Albany Regency," a political coterie in which Van Buren, W. L. Marcy, Benjamin Franklin Butler (1795-1858) and Silas Wright were among the leaders. Thurlow Weed, their bitterest opponent and the man who gave them their name, declared of them that he "had never known a body of men who possessed so much power and used it so well." Thurlow Weed owed his early political advancement to the introduction into State politics of the anti-Masonic issue (see ANTI-MASONIC PARTY), which also brought into prominence his co-worker W. H. Seward. As the anti-Masonic wave subsided, its leaders and most of its adherents found a place in the newly organized Whig Party which was powerful enough in New York to elect William H. Seward governor in 1838, and to re-elect him and to carry the State for W. H. Harrison against Van Buren in 1840. It was during the first administration of Governor Seward that the anti-rent agitation in the Hudson river counties began. Vast estates in Albany, Rensselaer, Columbia, Schoharie, Delaware, Sullivan and other counties were the seats of disturbance. Besides rent, many of the tenants were required to render certain services to the proprietor, and in case a tenant sold his interest in a farm to another he was required to pay the proprietor one-tenth to one-third of the amount received as an alienation fine. Politically, the anti-rent associations which were formed often held the balance of power between the Whigs and the Democrats, and in this position they secured the election of Governor John Young (Whig) as well as of several members of the legislature favourable to their cause, and promoted the passage of the bill summoning the Constitutional Convention of 1846. In the new Constitution clauses were inserted abolishing feudal tenures and limiting future leases of agricultural land to a period of 12 years. The courts pronounced the alienation fines illegal. Under the pressure of public opinion the great landlords rapidly sold their farms. Up to the election of Seward as governor, New York had usually been Democratic, largely through the predominating influence of Van Buren and the "Albany Regency." After the defeat of Governor Silas Wright in 1846, however, the Democratic Party split into two hostile factions known as the "Hunkers," or conservatives, and the "Barnburners," or radicals. The factions had their origin in canal politics, the conservatives advocating the use of canal revenues to complete the canals, the radicals insisting that they should be used to pay the State debt. Later when the conservatives accepted the annexation of Texas and the radicals supported the Wilmot Proviso the split became irrevocable. Only once between 1846 and the Civil War did the Democratic Party regain control of the State—in 1853-55 Horatio Seymour was governor for a single term. A succession of Republican governors held office until 1862 when the discouragement in the north with respect to the Civil War brought a reaction which elected Seymour governor.

With the exception of New York city the State was loyal to the Union cause during the war and furnished over half a million troops to the Federal armies. Certain commercial interests of New York city favoured the Confederate cause, but Mayor Wood's suggestion that the city (with Long Island and Staten Island) secede and form a free-city received scant support, and after the sanguinary draft riots of July 1863 (see NEW YORK CITY), no further difficulty was experienced.

After the Civil War the State began to reassume the pivotal position in national politics which has always made its elections second only in interest and importance to those of the nation, and the high political tension emphasized the evils of the "spoils system." In 1868 John T. Hoffman, a favourite of Tammany Hall, was chosen governor on the Democratic ticket. Tammany and Hoffman were again victorious in 1870; but in 1871 the New York Times disclosed the magnitude of the Tweed "Ring's" thefts, amounting in the erection of the New York county court house alone to almost \$8,000,000, and Tweed and his "Ring" were crushed in consequence. The Republicans carried the State in 1872, but in 1874 Samuel J. Tilden, a Democrat and the leading prosecutor of Tweed, was elected governor. The Republican legislature had in 1867 appointed a committee to investigate the management of the canal system, but the abuses were allowed to con-

tinue until in 1875 Governor Tilden disclosed many frauds of the "Canal Ring," and punished the guilty. In 1876, Tilden having been nominated for the presidency, New York cast its electoral vote for him. In 1880 it was cast for Garfield, the Republican nominee. Two years later the Republicans, having split over a struggle for patronage into the two factions known as "Half-breeds," or the Administration Party, and "Stalwarts" of whom the leader was Roscoe Conkling, were defeated, Grover Cleveland being chosen governor. In 1884 Cleveland as the Democratic presidential nominee received the electoral vote of his State. In 1888 Benjamin Harrison, the Republican candidate, the factional quarrels being settled, carried New York, but in 1892 Cleveland again carried the State. Hostility to free silver and "Bryanism" in the large financial and industrial centres put the State strongly in the Republican column in the State and national elections from 1894 to 1910. In the election of Nov. 1910 the Democrats carried not only the State but also the legislature, and John A. Dix was elected governor.

The Democrats again carried the State and the legislature in Nov. 1912, and Sulzer became governor. In the presidential contest, the Democrats carried the State for the first time in 20 years.

In April 1913, Governor Sulzer sent a special message to the legislature urging a direct primary law that would abolish party conventions. The legislature refused to enact the primary bill, and the governor vetoed the legislative substitute. When the legislature recessed on July 23 the governor declared the special session adjourned, but the legislature reassembled on Aug. 11. Two days later the assembly voted to impeach the governor; on Oct. 17 he was removed from office and Martin H. Glynn, lieutenant-governor, succeeded.

The Republicans were successful in the elections of Nov. 1914, and Whitman became governor, and in 1916 was re-elected. In the November election, 1918, Alfred E. Smith (Democrat) was elected governor by a small plurality of about 15,000. Most of the other State officers and the legislature, however, remained Republican. One of the most important laws of the year was the one providing for an income tax of from 1% to 3%. Shortly after his inauguration Governor Smith appointed a non-partisan reconstruction commission to investigate the problem of a fundamental reorganization of the State Government, and to consider other important problems of reconstruction resulting as an aftermath of the World War. This commission in its report of Oct. 10, 1919, recommended an executive budget and the consolidation of the numerous administrative agencies.

In 1920, a presidential election year, the Republican candidate, Nathan L. Miller, won over the Democrat, Alfred E. Smith, by 74,066 votes. The direct primary was abandoned and the convention system restored for the nomination of State and judicial officers.

The 1922 legislature authorized life-insurance companies to invest 10% of their assets in new buildings for dwelling purposes; extended the emergency rent laws to 1924 and fixed assessments as the basis for determining the reasonableness of rents. Women were given representation on county party committees. A home rule amendment was adopted. The 1922 election resulted in the selection of Alfred E. Smith as governor by an absolute majority of 269,609 votes.

In the autumn elections (1923) the voters approved an amendment extending to cities a large measure of home rule. The referendum on a bond issue for \$50,000,000 for new hospitals was likewise approved. An important measure of the session was the Home Rule Enabling Act, designed to carry out the amendment adopted the previous year. This law, drafted by the State home rule commission, was adopted unanimously by both houses of the legislature. The New York amendment differs from constitutional provisions in some other States in that it grants powers in general terms. In the presidential election of 1924 the Republicans carried the State by a majority of 383,813. Gov. Smith, however, was re-elected but the Republican candidates for the other six elective State offices were successful, and the legislature became more strongly Republican. In the fall election of 1925 the voters approved four constitutional amendments. The most important

provided for the governor's plan of consolidating the numerous State administrative agencies into 19 departments. Another amendment provided for a reorganization of the judicial system. In 1926 the Democrats were again successful in re-electing Governor Smith for a fourth term, and, as well, elected their candidates to all the other State offices, except that of attorney-general. The legislative houses remained Republican. A referendum on a question favourable to the modification of the National Prohibition Act was carried by approximately a three-to-one vote. In the election of 1927 the voters approved the constitutional amendment providing for an executive budget, thus carrying out the programme for the reorganization of the State Government one step further. In the 1928 election, though the State was Republican in its choice for president, Franklin D. Roosevelt, a Democrat, was elected to succeed Smith as governor.

(2.) *Government*.—Report of the State Reorganization Commission issued as *Legislative Document No. 72 State of New York* (1926); the annual volumes of the *State Legislative Manual*; and the *Reports of the various State departments*, especially the *Annual Reports of State Education Department*; C. Z. Lincoln, *The Constitutional History of New York* (1906), an elaborate and able study of the growth of the Constitution; *History of the State of New York, Political and Governmental* ed. R. B. Smith (1922); E. H. Roberts, *New York: The Planting and Growth of the Empire State* (1896) is a popular but rather superficial treatment of the entire period. The early historical documents of the State were collected by E. B. O'Callaghan in his *Documentary History of the State of New York* (1849-51); and more completely by J. R. Brodhead in *Documents Relating to the Colonial History of the State of New York Procured* (vols. i. xi. edited by E. B. O'Callaghan and xii.-xv. by B. Fernow 1853-83); O'Callaghan also edited *A Calendar of Historical Manuscripts in the Office of the Secretary of State in New York* (1865-66), and wrote a *History of New Netherland* (1846); J. R. Brodhead, *History of the State of New York* (1853 and 1871) is a standard work on the early history. Mrs. M. J. Lamb's *History of the City of New York* (1877) and Mrs. S. Van Rensselaer's *History of the City of New York in the Seventeenth Century* (1909) include the history of the province. W. Smith's *History of the Late Province of New York, from its Discovery to 1762* (1st part, 1757, reprinted in the 1st series of the New York Historical Society Collections, 1829-30) is still the chief authority for the period from the English Revolution of 1688 to the eve of the Revolutionary War. For the same period, however, consult C. W. Spencer, *Phases of Royal Government in New York, 1691-1719* (1905); John Fiske, *The Dutch and Quaker Colonies in America* (1900) which is admirable in its generalizations but unreliable in its details; M. W. Goodwin, *Dutch and English on the Hudson; a Chronicle of Colonial New York* (1919); G. W. Schuyler, *Colonial New York: Philip Schuyler and his Family* (1885), a family history, but especially valuable in the study of Indian affairs and the intermarriages of the landed families; C. Colden, *A History of the Five Indian Nations* (London 1747 and many later editions) and Francis W. Halsey, *The Old New York Frontier* (1901); A. C. Flick's *Loyalism in New York during the American Revolution* (1901) and H. P. Johnston's *Campaign of 1776 around New York and Brooklyn* (1878) are thorough studies. For the military history of the Revolutionary War see also J. Winsor's *Narrative and Critical History of America*, vol. vi. (1888). For strictly political history see a series of articles by Carl Becker in the *American Historical Review*, vols. vi., vii. and ix., and the *Political Science Quarterly*, vol. xviii., J. D. Hammond's *History of Political Parties in the State of New York* (1842); D. S. Alexander's *Political History of the State of New York* (1906-23); and D. R. Fox, *The Decline of Aristocracy in the Politics of New York* (1918). See also E. P. Cheney, *The Anti-Rent Agitation in the State of New York* (1887); C. McCarthy, "The Anti-Masonic Party" in vol. i., pp. 365-574 of the *Annual Report for 1902 of the American Historical Association*; N. E. Whitford, *History and the Canal System of the State of New York* (1906); and D. C. Sowers, "The Financial History of New York from 1789 to 1912" in *Columbia University Studies in History, Economics and Public Land* vol. lvii. No. 2 (1914). (A. E. S.M.)

NEW YORK (CITY), the largest city in the United States, is situated at the mouth of the Hudson river, here sometimes called the North river. The five boroughs comprising the city are: the Bronx (Bronx county), 42.74 sq.m., on the south-eastern

most part of the mainland adjoining Westchester county and separated from the borough of Manhattan by the Harlem river (a canalized waterway connecting the Hudson and East rivers); Manhattan (New York county), 22.20 sq.m., on Manhattan island between the Hudson and East rivers; Queens (Queens county), 109.88 sq.m.; Brooklyn (Kings county), 74.14 sq.m., on the western end of Long island, adjoining Nassau county and separated from the Bronx and Manhattan by the East river; and Richmond (Richmond county), 59.99 sq.m., on Staten island south-west of Brooklyn and separated from it by the Narrows (a strait connecting Upper and Lower bays) and from the mainland of the State of New Jersey by tidal estuaries known as Kill van Kull and Arthur Kill. The City Hall, near the southern end of Manhattan island, is in lat. $40^{\circ} 42' 43''$ N., and long. $74^{\circ} 0' 29''$ W. The greatest width of the city, east and west, is 24 m. and the greatest length, north-east and south-west, is 35 miles. Its area, including small islands of 13.09 sq.m., is 308.95 sq.miles. The more important of the small islands are: North and South Brother, Riker's, City, Hunter, Hart, Governor's (occupied by a U.S. military reservation), Welfare (formerly Blackwell's), Ward's, Randall's (the latter three occupied by State and city institutions) and numerous islands in Jamaica bay. Bedloe's island (on which stands the Bartholdi statue of Liberty) and Ellis island (occupied by the Federal Government as an immigrant station) are in Upper bay, within the bounds of New Jersey. The total water front is 578 m., of which Manhattan has 43 m.; Brooklyn, 201 m.; the Bronx, 80 m.; Queens, 197 m.; and Richmond, 57 miles.

Population.—In 1626 there were fewer than 200 inhabitants, 1,000 in 1656, and but 14,000 in 1760. About 1783 New York began its rapid growth as the leading port. Between 1786-96 the population had nearly doubled, and by 1871 it was 1,000,000. In 1926 the total population was 5,924,138 and the estimate for 1928 was 6,017,702 divided as follows: Manhattan, 1,752,018; Bronx, 951,945; Brooklyn, 2,308,631; Queens, 854,449; Rich-

mond, 150,659. In 1898 the five boroughs were united to form Greater New York.

Harbour.—The harbour is naturally divided into several parts. At the entrance from the Atlantic is the outer harbour (about 122 sq.m.), known as Lower bay. Raritan bay lies adjacent to the Lower bay on the west and Raritan river and Kill van Kull flow into the west side of Raritan bay. The Ambrose Channel is the chief of several channels crossing the broad bar at the entrance to the outer harbour. It leads north-westward and then northward into the inner harbour, through the Narrows, a neck about 1 m. wide between Long Island and Staten island. The inner harbour consists of the Upper bay, 4 m. long and 4 m. wide, lower Hudson river, East river, Long Island sound and tributary waterways. The tributary waterways to the east are Gowanus creek, Newtown creek, Harlem river, Bronx river, Westchester creek, Flushing bay and creek and Eastchester creek. Tributaries to the west are Kill van Kull, Arthur Kill, Newark bay, Passaic river, and Hackensack river. Anchorage channel, an extension of Ambrose channel, extending through the Upper bay to the mouth of the Hudson river at the Battery and marking the southern extremity of Manhattan island, affords a depth of 40 ft. at mean low water for a width of 2,000 feet. The direct water frontage of the port of New York is 771 m. and the developed frontage measured around piers and the heads of slips is 346.5 miles. The total frontage measured around piers and along shore line is 994.8 miles. The mean tidal range is 4.6 ft. in the Lower bay and 4.5 ft. in the Upper bay. The harbour also has two northern entrances: the north-east entrance from Long Island sound by the East river, principally used by New England coasting vessels; and the North (lower Hudson) river, by which the inland water-borne traffic of the Hudson river and the Erie canal is brought to the port of New York.

I. METROPOLITAN DISTRICT

The New York metropolitan district, as defined in 1927 for the U.S. Bureau of the Census, includes a land area of 3,768 sq.m. lying in the States of New York, New Jersey and Connecticut, and had an estimated population, as of July 1, 1926, of 9,472,500. In addition to New York city, it includes such important centres of industry and population as Newark, Paterson, Elizabeth, Bayonne, Hoboken, Passaic, Union City, East Orange, Perth Amboy, Orange and New Brunswick, in New Jersey; Yonkers, Mount Vernon, New Rochelle and White Plains, in New York; and Stamford and Norwalk in Connecticut. Altogether the district contains 373 independent, self-governing municipalities lying within a radius of approximately 40 m. from New York City Hall.

II. COMMERCE AND INDUSTRY

In 1926, the tonnage cleared from the port amounted to 20,427,000. The tonnage for foreign trade amounted to 21.6% and the value to 42.1% of that of all United States ports.

The area of the port of New York district within the jurisdiction of the port authority is about 1,500 sq.m. extending from below Sandy Hook on the south to Tarrytown on the north, a distance of approximately 48 m. and east and west to an average approximate width of 32 miles. About 200 distinct municipalities are included in this area. Serving the area of the port authority, the first of the belt lines (No. 13), a consolidation of short transfer lines, was established in 1925. It extends a distance of $17\frac{1}{2}$ m. along the west bank of the Hudson river and affords a connection with all of the rail trunk lines entering the New Jersey side of the port. A vehicular tunnel connects New York and New Jersey. By special direction of the two States, the port authority undertook in 1925 a programme of highway bridge construction involving an aggregate expenditure of approximately \$100,000,000. Two bridges have been built across the Arthur Kill, one from

WEATHER GRAPH OF NEW YORK CITY. THE THERMOMETER INDICATES NORMAL ANNUAL MEAN TEMPERATURE. THE CENTRE CURVE SHOWS NORMAL MONTHLY MEAN TEMPERATURE. THE CURVES ABOVE AND BELOW, THE HIGHEST AND LOWEST EVER RECORDED IN EACH MONTH. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION; THE SHADED COLUMN, TOTAL PRECIPITATION (INCLUDING MELTED SNOW); THE WHITE COLUMN, SNOWFALL.

mond, 150,659. In 1898 the five boroughs were united to form Greater New York.

The negro population (estimated at 248,000) is centred in the Harlem district, between 116th and 150th streets, in an area bounded on the east by Fifth avenue and on the west by St. Nicholas avenue. The Chinese quarter is in the neighbourhood of Chatham square, on Mott, Pell and Doyers streets. The greatest density of population, according to information made public by the Regional Plan of New York and its Environs, occurs on the lower east side in the district bounded by Avenue B, Avenue D, East Ninth street and East Third street. Here there are 650 persons to the acre. On the upper east side the maximum density

Perth Amboy, N.J., to Tottenville, S.I., and the other from Elizabeth, N.J., to Howland Hook, S.I. A third bridge started by the port authority promises to be one of the most important of all bridges. It will connect the northern part of Manhattan island with the borough of Fort Lee, N.J., and will have a suspension span measuring 3,500 ft. in length or more than twice as long as any other suspension span heretofore constructed. The cost of opening this bridge for traffic is estimated at \$60,000,000. A bridge over the Kill van Kull and the one across the Hudson are expected to be ready for traffic by 1932.

Banking, Exchange and Insurance.—Since the beginning of the city's history, the financial district of New York has been at the end of Manhattan island, below Fulton street. Here are the largest banks and trust companies, the exchanges, and many insurance headquarters. In 1784, Alexander Hamilton wrote the constitution for the Bank of New York, the first bank to be established in the city, in operation five years before the U.S. Constitution was adopted. This bank was originally at 67 Saint George's square, now Pearl street, and was later moved to 11 Hanover square. The first bank of the United States was established in 1791, and a branch known as the office of discount and deposit was opened in New York in the same year. The Bank of the Manhattan company was the third bank to be organized in the city and its charter is notable as being the first to enable a public utility company to engage in banking. The Manhattan company furnished New York with water for 43 years. The Bank of the Manhattan company is still at its original location at 40 Wall street. It continues to operate under its original charter, through the expedient of maintaining a water-tower. The Merchants and Mechanics and Metals National banks, the Bank of America, the Phoenix and City (now the National City bank), all date from the early 19th century. When the Chemical National Bank was organized in 1823, there were already 12 others, having an aggregate capital of over \$15,000,000.

The Sub-Treasury of the United States, formerly on Wall street, was abolished when the Federal Reserve system went into operation in 1914. A part of the functions of the Sub-Treasury are carried on by the U.S. assay office at 32 Wall street. The New York Clearing House, now located at Cedar street, between Broadway and William street, was established in 1853. The bank clearings for the year ending on Sept. 30, 1927, were \$307,158,631.043.07. New York is the centre of the Federal Reserve district No. 2 (*see* BANKING). On Sept. 30, 1927, there were 33 State banks in the borough of Manhattan with total resources of \$1,307,450,362 (*see* TRUST COMPANIES). The New York Stock Exchange (*q.v.*) occupies a building designed by James Rennick and has 1,100 members. The New York curb market was formerly an open-air market for selling unlisted securities. It is now housed in its own building at 78 Trinity Place, completed in 1921. (*For* insurance companies, *see* INSURANCE.)

Wholesale Trade.—The clothing market is chiefly centered in Broadway, Manhattan, between 34th street and Canal street, and in cross streets between Third and Seventh avenues. Silk establishments have two principal centres, one bounded roughly by 23rd and 34th streets and Third and Fifth avenues; the other, on or adjacent to Broadway between Canal and 8th streets. Fur establishments are now sharply localized between Broadway and Eighth avenue and 23rd and 34th streets. The millinery business, formerly chiefly along Broadway, between Canal and 14th streets, is now moving to a centre between Broadway and Fifth avenue above 34th street. Boot and shoe establishments are almost exclusively in lower Manhattan between Broadway and West Broadway below Canal street. Jewellery, formerly concentrated in and about Maiden lane, has now become distributed in smaller groups between Maiden lane and 50th street, along Broadway and Fifth avenue, with a large and growing centre at and about the intersection of Canal street and the Bowery. Fruit and produce markets are centralized in Manhattan between Canal and Cortlandt streets, and West Broadway and the North river. The fish, butter, egg and cheese markets, are highly concentrated on the lower west side between Harrison and Greenwich streets and meat establishments centre at West 14th street and the North river. The coffee,

tea and spice markets are mainly in a small area on the lower east side about Water and Front streets. Hardware houses are around Warren and Chambers streets, west of Broadway; paper and stationery are much more widely scattered now than formerly, largely owing to the uptown movement of printing and publishing establishments, one great centre being now at or near Park Row and the other in the neighbourhood of the new post-office about 34th street. Drug establishments are chiefly in lower Manhattan, on the east side of Broadway and below Chambers street, while leather dealers are just below Brooklyn bridge.

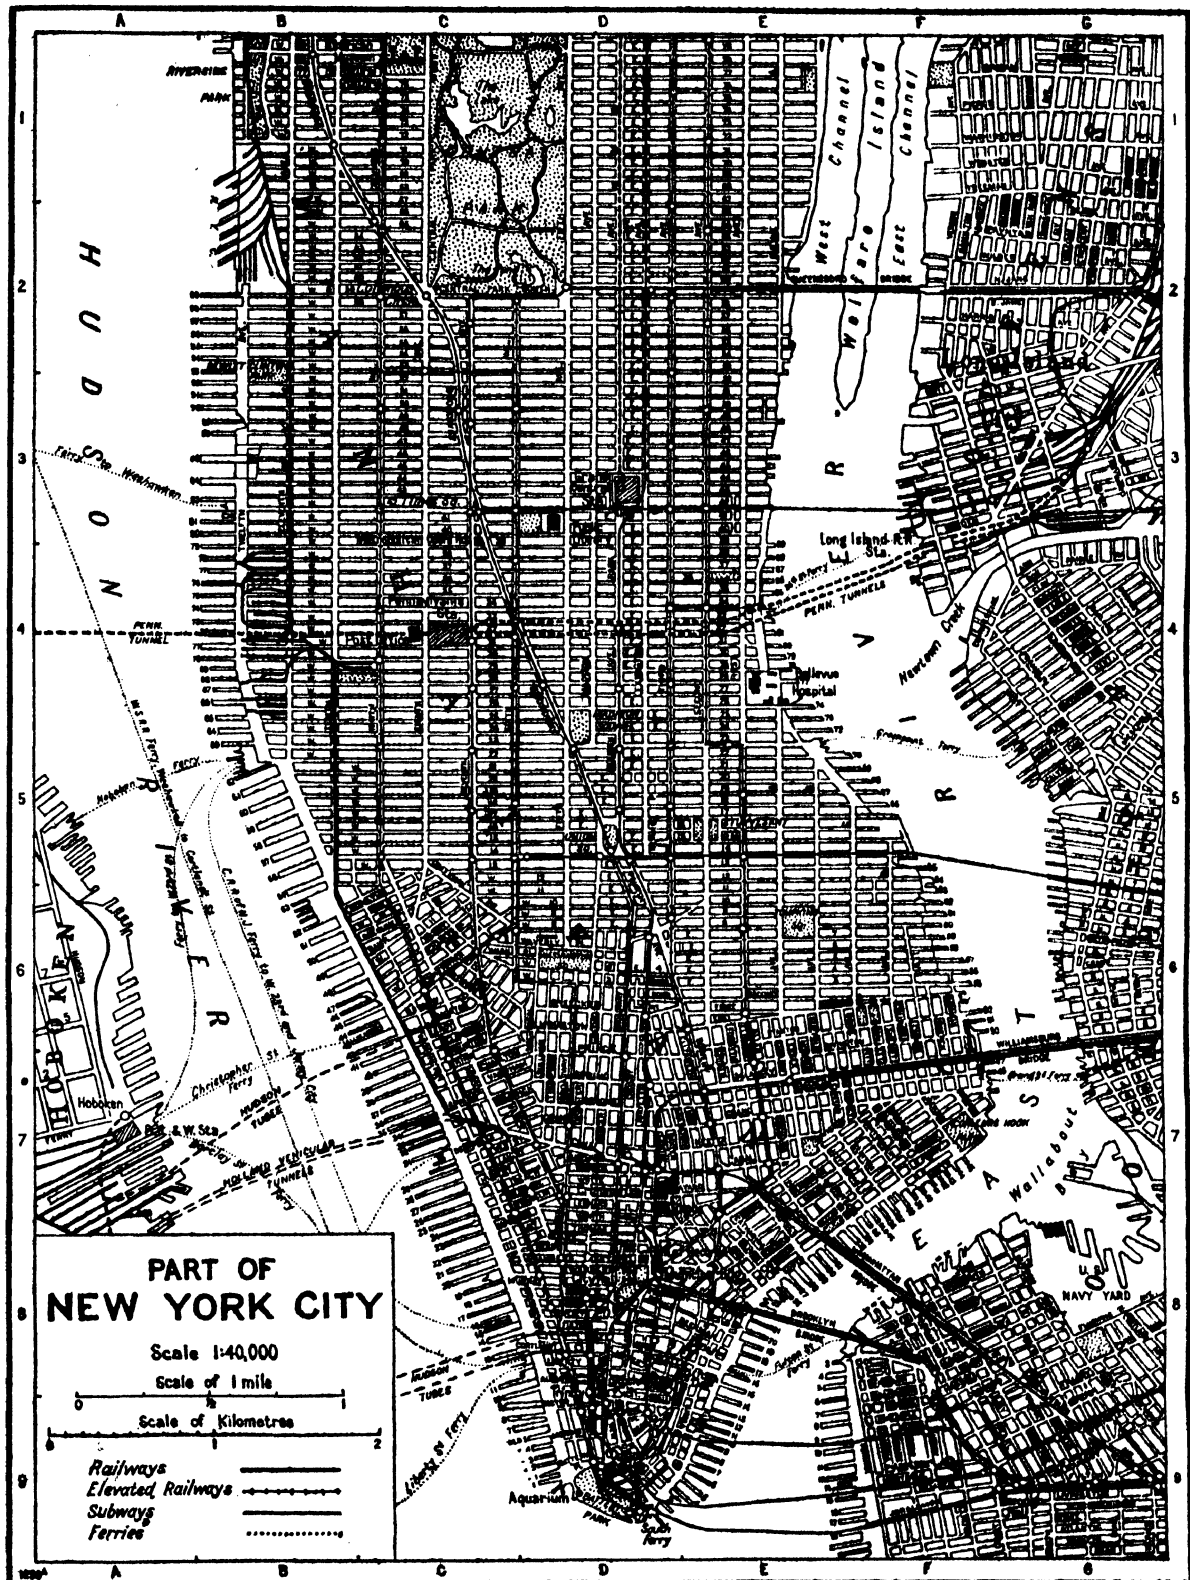

Retail Trade has followed the northward movement of population of Manhattan. In 1850, it was at Canal and by 1880 at 14th street. It now lies between 31st and 59th streets, and Third and Eighth avenues.

Fifth avenue was formerly exclusively residential but is now given up to retail trade as far north as 59th street. Beyond that a zoning ordinance reserves it for residence. Some of the largest department stores are still on 34th street, and the greatest volume of trade is done there. One store on this street receives more than a million dollars a week from purchasers. But the northward trend of the residential section has affected the character of the trade and the more expensive shops, including some of the oldest retail firms, are farther up Fifth avenue continually pressing on toward the most exclusive residential quarters of the city which are now on Park and Fifth avenues, above 60th street. The dress-makers, milliners and tailors for this district are in the side streets leading off Fifth avenue. Madison avenue, because of its situation between Park and Fifth avenues, is rapidly taking on the aspect of the latter, and is lined with shops from 42nd street to the Eighties. The art and antique dealers are on 57th and adjacent streets, and on Madison and Lexington avenues. There are a number of small antique shops on 8th street. Automobile houses are near Columbus circle and up Broadway from 55th street for more than ten blocks. Brooklyn and the Bronx now have important local shopping districts of their own with department stores and banking and financial districts.

Building Construction.—In 1927 there were 644,692 buildings in the five boroughs, having a total assessed valuation of \$6,896,518,364. In 1927, to Oct. 1, 38,381 buildings were erected, valued at \$667,493,895. Six buildings completed during 1926-27 were valued at from 5 to 14 millions each.

Modern building construction in New York dates from the erection of the ten-storey Tower building in 1889. Much higher structures have since been made possible by the increased knowledge of steel and concrete and the perfection of passenger elevators. The razing and rebuilding process, however, is carried out under the strict regulations of a building code. It is frequently amended to meet the demand of economic and social changes as well as the advances in the technical phases of construction methods. A further regulation of building construction is effected by the Tenement House law of 1901, which provides especially for better lighting, ventilation and sanitary conditions; the building Zone resolution of 1916, which regulates and limits the location, height and bulk of buildings (*see* CITY PLANNING AND ZONING); and the Housing Act (1927) which permits the legislature to authorize counties to acquire by condemnation more land and property than is needed to widen, extend or relocate parks, public places, highways or streets. In 1927 was passed a new municipal housing law which grants local tax exemption for 20 years to buildings constructed as substitutes for old, unsanitary tenements.

Manufacturing.—The total value of the products manufactured in the factories of New York City in 1925 was \$5,324,413,612. The average factory in 1925 employed 22 wage earners and manufactured \$224,526 worth of goods. The ten leading industries in 1925 were: women's clothing, \$1,008,966,387; men's clothing, \$379,339,161; printing and publishing, newspapers and periodicals, \$303,788,130; fur goods, \$194,803,213; millinery and lace goods, \$194,404,559; bread and other bakery products, \$181,173,270; slaughtering and meat-packing, \$163,485,321; printing and publishing, book and job, \$160,049,971; tobacco, cigars and cigarettes, \$111,970,571; boots and shoes, \$86,408,059.

Map showing lower portion of Manhattan Island from the Battery (the extreme southern point of the Island) to 79th Street. There is also shown the network of bridges, ferries and tunnels which connect Manhattan with Brooklyn and Queens county (right) and with New Jersey (left). North of about 14th Street the island is laid out in a rectangular street plan, the numbered streets running east and west, and the avenues north and south, with Broadway running obliquely from south-east to north-west. Below 14th Street and especially in the financial district of lower New York the streets, which date from Dutch and English Colonial days, are irregular and narrow. The many piers on both river-fronts accommodate the ocean, coastal and river shipping

III. TRANSPORTATION AND COMMUNICATION

Railroads and Rapid Transit.—The problem of transportation and communication in New York City is unique because of the extraordinary concentration in certain regions. The New York Central and Hudson river and West Shore railways follow closely the Erie canal route to Buffalo. The Erie, the Lehigh Valley, the Pennsylvania and the Delaware, Lackawanna and Western railways reach Buffalo by routes across New Jersey, Pennsylvania and western New York. The New York, New Haven and Hartford railway affords communication with New England; and the Pennsylvania, and the Baltimore and Ohio railways, with the middle-western and south-eastern parts of the country. The Central railroad of New Jersey and the Long Island railway (belonging to the Pennsylvania), are primarily local. The New York Central and the New York, New Haven and Hartford railways have a common terminal in Manhattan (Grand Central station), at 42nd street and Park avenue, and the Pennsylvania has its great terminal at 32nd street and Seventh avenue, with tunnels to Long Island and New Jersey. The Pennsylvania terminal is used also as a terminal by the Long Island railway which has another terminal at Atlantic and Flatbush avenues in the borough of Brooklyn. The other railway terminals are on the New Jersey bank of the Hudson and are reached either by tunnel, ferries or subways under the river. The Interborough Rapid Transit Company, and the New York Municipal Railways Corporation operate subway and elevated lines. The former were built mostly since 1913. Steam locomotives were used on the first elevated railroad, which forms that part of the present Ninth avenue elevated railway extending from Battery Place near the southerly end of Manhattan to 30th street. This piece of construction was opened for traffic in 1870, and was slightly over 3 m. in length. The next decade witnessed its growth to 32.5 route miles of track forming four separate transit lines extending north and south on Manhattan; three reached the Harlem river and one ended at 59th street. These lines were entirely private enterprises, built and operated over the public streets under perpetual franchises granted by the State legislature. For the next 20 years, there were no extensions to the rapid transit lines on Manhattan, but some progress was made in other boroughs—the Third avenue "L" in Manhattan was extended across the Harlem river as far as 169th street by 1888, to 177th street by 1891, to Fordham road by 1901 and to its terminus at Bronx park by 1902. In the Borough of Brooklyn, the first elevated, the Lexington avenue line, having a route length of about 6 m. was opened in 1885. This line was extended and other lines built until by 1900 the Brooklyn system had a route length of 62 miles. In 1902, the motive power of these elevated lines was changed from steam to electricity. In 1900 the first "subway" was planned and finally extended from the Bronx, through Manhattan, to Brooklyn, under the East river. This rapid transit system was a municipal undertaking, its construction cost being entirely defrayed by the sale of bonds issued by the City of New York. Between 1908–10 two tubes under the Hudson river connecting Manhattan with Hoboken (terminus of the Delaware, Lackawanna and Western), and Jersey City (terminus of the Erie, Pennsylvania and Central of New Jersey railways) and a connecting tube which extends up Sixth avenue from Cortlandt street to 33rd street were completed. In 1913 the city entered into contracts to create two interborough rapid transit systems, each comprising extensions to the existing lines; the one provided for a new Lexington avenue line and the extension of the west side subway down Seventh avenue to lower Manhattan and thence by tunnel to Brooklyn, which, with other extensions, brought the track mileage up to about 334 m. of which 119 are owned by the company and 215 by the city. Another contract included a four-track subway on Broadway and Seventh avenue, Manhattan, extending through tunnels to Brooklyn and Queens. The operating contracts made with the two companies run for 49 years, dating from Jan. 1, 1919, and from Aug. 1, 1920, respectively. In 1925, the City of New York began building an independent subway system, which when completed will comprise about 60 route m. and 185 track miles.

Streets.—The first comprehensive street plan was made in

1811; with few changes, notably the laying out of Madison avenue, midway between Fourth and Fifth avenues, north of 23rd street, and Lexington avenue between Third and Fourth avenues, north from 21st street, it is the street plan of Manhattan to-day as far north as 155th street. The 120,000 population at that time was concentrated south of Houston street. The plan provided straight line "avenues," with a uniform width of 100 ft. extending longitudinally along the island and separating block lengths ranging from 610 to 920 feet. At right angles thereto, "streets" usually 60 ft. wide were laid out, but 15 were made 100 ft. wide. These streets were separated by a block depth of 200 feet. The plan included the extension of Broadway, which has a general direction diagonally across Manhattan to 79th street, whence it parallels the other avenues. This system has been called upon to perform duties hardly foreseen at that time, and it has been overtaxed by permitting elevated railroads over portions or all of six of the avenues and railways on parts of four more. The streets of Greater New York have a total mileage of 4,700. Manhattan has 490 miles, practically all of which are paved. The rapid growth of the city, the sky-scraper, and the use of motor vehicles have produced serious traffic congestion in some sections of the city, and this has necessitated extensive street widening and the development of new thoroughfares. Notable recent examples are the Varick street extension of Seventh avenue, the Lafayette street improvement and the southerly extension of Sixth avenue in Manhattan, the extension of Flatbush avenue, and the widening of Kings highway in Brooklyn, the construction of Jamaica bay, Queens and Conduit boulevards in Queens, and the construction of the Grand Concourse in the Bronx.

The more notable streets include Wall street, on lower Manhattan, the heart of the financial district; Fifth avenue with its fine shops, residences, clubs, library and museum; Riverside drive, overlooking the Hudson, Park avenue, which continues Fourth avenue above 32nd street to the Grand Central terminal and thence from 45th street to the Harlem river, and is lined with fine apartment houses in the middle section above 45th street; the Bowery, which runs diagonally through the east side of lower Manhattan from Brooklyn bridge to intersect Fourth avenue at 8th street; and Broadway, which extends over 18 m. from the southern tip of Manhattan to the northern limits of the city. In its middle part, from 10th to 79th streets, it cuts through the heart of the business and amusement centre. This street owes its name to the Dutch, who called it the "breede weg." It is no longer a "broad way," but quite narrow, particularly in the lower downtown section. From 34th street to Columbus circle at 59th street it forms the centre of the automobile, theatre, moving picture, restaurant and night life district. Subways follow the course of Broadway for the greater part of its extent.

Practically every avenue in the borough of Manhattan except Fifth avenue, Park avenue and Riverside drive has surface cars, and there are crosstown lines about every sixth block, from 8th to 42nd streets, and on 59th, 86th, 116th, 125th and 145th streets. These now act mainly as "feeders" for the rapid transit lines and, to a less extent, for ferries between Manhattan, New Jersey and Staten island. In other boroughs street railways form a larger and more important part of the transportation system. In 1927 there were 36,592 omnibuses, including the taxicabs. In that year the Fifth Avenue Coach company (the largest private omnibus company) carried 74,931,000 passengers with about 400 buses operating a total distance of 13,026,000 miles. Licences were issued for the operation of 464,225 pleasure cars and 111,776 commercial vehicles which made a total of over 600,000 motor vehicles registered in 1927. In sections unserved by regular or private omnibus companies, the municipal department of plant and structures operates 35 emergency omnibus lines.

Bridges and Tunnels.—There are at present five bridges spanning the East river and one under construction over the Hudson river which will, when completed, extend from a point near 178th street, Manhattan, to Fort Lee, N.J. The Brooklyn, Manhattan and Williamsburg bridges have their Manhattan terminals at Park Row, Canal, Clinton and Delancey streets, respectively. All are suspension bridges and connect Manhattan island

NEW YORK HARBOUR, IN 1690 AND 1928

NEW YORK (CITY)

MANHATTAN ISLAND

An air view of Manhattan Island, showing the Hudson (North River) at the left, and East River at the right. In the upper left hand corner of the picture a portion of the New Jersey shore is seen, while on the right is Long Island

with Brooklyn. Brooklyn bridge, the first to span the East river, was opened to traffic on May 24, 1883. The Manhattan bridge was opened to traffic on Dec. 31, 1909, the Williamsburg bridge on Dec. 19, 1903 and the Queensboro bridge on March 30, 1909. All of these are municipally owned and operated for highway, trolley, elevated railways and pedestrian traffic. The fifth bridge to span the East river, called the Hell Gate bridge, is owned by the New York Connecting railroad company and is exclusively for railway traffic.

The Harlem river is crossed by 13 bridges of various types and designs. The most notable is the famous High bridge (1848) which carries an aqueduct of the city water-supply. This was rebuilt in 1928 to improve navigation.

Transportation of passengers by rail between the boroughs of Manhattan, Brooklyn, the Bronx and Queens, and New Jersey is provided by means of tunnels constructed well below the beds of the East, Hudson and Harlem rivers. Vehicular transportation between Manhattan and Jersey City was made possible by the opening to traffic of the Holland vehicular tunnel (q.v.) in Nov. 1927, a twin-tube highway, 9,250 ft. in length. The Pennsylvania railroad has four tubes across the East river and two across the Hudson. The Hudson and Manhattan railroad company has two systems, each comprising two single track tubes from Jersey City, one to the down-town section of Manhattan looping around Fulton and Cortlandt streets at Church street, the other entering at Morton street and extending to 33rd street. The Brooklyn-Manhattan Transit Corporation has six rapid transit tubes under the East river, these are laid in pairs leaving Manhattan at Whitehall, East 14th and East 60th streets. The Interborough Rapid Transit Company also has three pairs of transit tubes leaving Manhattan at Whitehall street, Old Slip and East 42nd street. Practically all of the present railroad and rapid transit tunnels were completed between 1900 and 1920. In connection with the new independent subway system, the board of transportation has designed five new tunnels, one of which is now being constructed under the East river between 53rd street, Manhattan, and Mott avenue, Queens, and will form the connection between the Sixth and Eighth avenue trunk lines and those from Jamaica and central Brooklyn at Union station in Long Island City. Two other tunnels under the East river will connect Fulton street, Manhattan, with Cranberry street, Brooklyn, and Rutgers street, Manhattan, with Jay street, Brooklyn. Under the Harlem river will be a track tunnel connecting the Washington Heights line with the subway under the Grand Concourse in the Bronx. This will extend from the Polo grounds at 156th street and Eighth avenue, Manhattan, to the Yankee Stadium at 161st street and Jerome avenue, the Bronx. The fifth under-river tunnel will be under Newtown creek, which separates Brooklyn and Queens.

Ferries.—The city department of plant and structures, the railroads with terminals in New Jersey, and many private companies operate ferries in and about New York harbour.

Airports.—Among commercial flying fields in operation in 1929 which serve the city should be mentioned Curtis Field at Garden City, Long Island, and Roosevelt Field at Mineola, Long Island, Teterboro Airport at Hasbrouck Heights, N.J., and the Newark Airport at Newark, N.J.

Telephone and Telegraph.—The New York Telephone Company has some 1,600,000 telephones, and in 1927 daily calls averaged 7,150,862. Telegraph and cable service is supplied mainly by the Western Union and Postal Telegraph companies. The former maintains 229 offices and the latter 116 in New York city. These 345 offices handled approximately 70,000,000 messages in 1927. Twenty-six cables touch New York, 13 owned by the Western Union, seven by the Commercial, three by the French, two by the All America and one by the United States and Haiti cable companies.

Postal Service.—The post-office of New York city in 1827 was located in a small two-storey frame building on Garden street (now Exchange place), and the entire force consisted of some eight clerks and six letter carriers. Fifty years later the present City Hall station at Park Row and Broadway was the

general post-office. In 1914, the present General Post-Office building was opened on Eighth avenue from 31st to 33rd streets, containing a half million square feet of floor space. There are in addition, 48 carrier stations, six financial stations, and 265 contact or substations, and nine independent post-offices. The transportation of mails is expedited by means of an underground pneumatic tube system consisting of 27 m. of double line 8 in. tubes, with a carrying capacity of over 200,000 pieces of mail per hour. In 1827, the postal receipts amounted to about \$125,000; in 1927 they exceeded \$75,000,000. Sixteen million pieces of ordinary mail are handled daily.

IV. GOVERNMENT

The present form of government was inaugurated by the Greater New York charter of 1897. This provides for a mayor elected at large, five borough presidents, chosen by the voters of their respective boroughs, a board of aldermen of 65 elective members, one from each aldermanic district, with a president of the board of aldermen, elected at large. A controller, elected at large, is also provided to be the head of the department of finance. The mayor, controller, president of the board of aldermen and the five borough presidents are designated as members of the board of estimate and apportionment. In this body, the mayor, controller, and president of the board of aldermen have three votes each, the presidents of the boroughs of Manhattan and of Brooklyn, two votes each, and the presidents of the boroughs of the Bronx, Queens and Richmond, one vote each. The board of estimate and apportionment is the general policy-making and finance-controlling branch of the government. The board of aldermen, in which each of the borough presidents has a seat and one vote, is chiefly concerned, as an independent body, with the enactment and repeal of local ordinances. By virtue of the City Home Rule Act of the State in 1924, the board of estimate and apportionment and the board of aldermen were combined as the municipal assembly which consists of two branches with the above titles, but having much broader legislative powers with respect to the property, affairs and government of the city. The municipal assembly functions in much the same way as bicameral legislatures elsewhere. When the board of aldermen is functioning as a branch of the municipal assembly, the borough presidents are not, however, entitled to sit as members of this body. A local law may originate in either branch of the municipal assembly, and if passed by one branch may be amended by the other. A majority affirmative vote of the total voting power of each house of the municipal assembly is necessary for enactment of law. The mayor may veto the ordinances and resolutions of the board of aldermen or a bill passed by the municipal assembly, which veto, in either case, may be overridden, by a three-fourths vote of the board of aldermen or a two-thirds vote of each branch of the municipal assembly. Before signing a bill passed by the municipal assembly the mayor must hold a public hearing after five days' notice. The board of aldermen has also many powers which it exercises independently of the municipal assembly. It may make, amend, and repeal all ordinances, initiate the issue of special revenue bonds for emergency expenditures, authorize purchases in excess of \$1,000 without public letting, exercise general legislative control over water rates, street traffic and public markets, and reduce or eliminate, during the 20 days allowed for consideration, any item of the budget as passed by the board of estimate and apportionment.

The mayor as chief executive of the city is responsible for the administration and appoints the heads of all departments of the city government except the department of finance, which is under the elective controller, and those departments which are under the exclusive direction of the borough presidents. The borough presidents are responsible for highways, sewers and topographical work in their respective boroughs, the care of public buildings and offices, and the enforcement of the building code. In the boroughs of Richmond and Queens, the borough presidents are also in charge of street cleaning and waste disposal.

There are in all 83 permanent government agencies in the combined city-county jurisdiction. The major departments of gov-

ernment which are specified as "administrative departments" in the city charter are the departments of finance, law, police, water-supply, gas and electricity, street cleaning, plant and structures, parks, public welfare, correction, fire, docks, taxes and assessments, education, health, tenement house and purchase.

There are five county governments within Greater New York, namely, New York, Bronx, Kings, Queens and Richmond. The officers of these are practically independent of those of the city and are mainly elected by the people.

Regular officers and employees of the greater city for 1928 totalled about 121,500, not including several thousand in temporary or emergency services. Civil service regulations apply to all officers and employees of the city except officers elected by the people, legislative officers, and staffs of educational institutions which have special professional standards. The civil service commission consists of three members appointed by the mayor—not more than two of whom may be of the same political party.

In 1920, the New York city employees' retirement system was put into effect. All persons in city service whether appointive or elective, who entered or re-entered the city service after Oct. 1, 1920, and who have completed six months of city service are eligible to the benefits of this retirement system, except those entitled to share in the police pension fund, the fire department relief fund, the teachers' retirement system, or the department of street cleaning relief and pension fund.

V. FINANCE AND TAXATION

In the year 1928 the total budget of the city amounted to the sum of \$512,528,831.49, of which \$484,827,295.35 was for the city government exclusive of the county governments and the State tax. Of the total the amount to be raised by taxation was \$429,021,155.18. Principal and interest of the city's long-term debt requires \$104,284,902.73; and for instalment on account of four year rapid transit corporate stock for the new independent subway system, and for all other purposes, except State tax, \$394,117,081.75. The chief items of the present budget are: legislation, \$664,787; city and county administration, \$19,300,895.41; borough government, \$26,664,449.07; educational and recreational services (including department of education, \$84,347,196.13), \$105,735,799.24; protection of life and property (including police department, \$44,903,708.40, and fire department, \$19,957,678.30), \$67,104,627.70; health, sanitation and care of dependents (including health department, \$6,342,960; department of public welfare, \$10,277,974.58; board of child welfare, \$6,126,946; Bellevue and Allied hospitals, \$4,053,439.25; tenement house department, \$1,026,532; department of water-supply, gas and electricity, \$13,706,176.05; department of street cleaning, \$27,302,644.33; payments to nonmunicipal charitable institutions, \$8,430,669.75), \$77,441,943.60; correction, \$2,755,716.25; facilitating commerce and traffic (including department of plant and structures, \$9,139,508.91, department of docks, \$1,613,974.64, board of transportation, \$6,000,000), \$16,753,483.55; courts, \$12,363,696.38; central purchase, printing and publicity, \$2,141,775.50; debt service and tax deficiencies, \$154,474,902.73; miscellaneous (including pensions, salary adjustments, repaving and resurfacing streets, public improvements, snow removal, anticipated claims, etc.), \$12,567,284.58; State tax, \$14,126,847.01.

The assessed valuation of real estate (including corporation estates and franchises) and personal property of the city (1928) is: real estate, \$15,845,505,899; personal estate, \$308,440,050; total, \$16,153,945,949. The basic tax rate for 1928 was \$2.66 for each \$100 of assessed valuation. The assessments for local improvements in the various boroughs give a combined tax rate for the boroughs as follows: Manhattan, \$2.73; the Bronx, \$2.71; Brooklyn, \$2.74; Queens, \$2.76; and Richmond, \$2.73.

The budget-making period runs from June to December. Not later than Aug. 1 the various bodies submit their estimates to the board of estimate and apportionment. The board of aldermen may reduce or eliminate items (except those exempted by law). The mayor may veto the action of the board of aldermen, which in turn may override his veto by a three-fourths vote.

After the adoption of the budget, the board of taxes and assess-

ments prepares the assessment rolls. These must be delivered on March 1 to the board of aldermen, which must meet not later than the first Monday in March to fix the annual tax rates. When this has been done and the amounts to be collected from the various taxpayers have been extended upon the rolls, the board of aldermen must deliver them not later than March 28, to the receiver of taxes or city collector directing him to collect the taxes as set forth, and to pay them to the city chamberlain. The city collector is chief of the bureau of city collections in the department of finance.

Fiscal affairs are in general under the control of the controller, who is the head of the department of finance. The functions of this office are, mainly, the collection of revenues, the audit of accounts, the maintenance of the general accounting system, investigation of all matters involving finances, the preparation of accounting statistics, and the adjustment of claims. The treasurer is, however, the city chamberlain, who is appointed by the mayor. Although under the charter the chamberlain is in the department of finance, he is actually quite independent of this department. Other officers, boards and commissions exercising functions of fiscal control or collection of revenues are the sinking fund commission, the commissioners of accounts and of purchase, the departments of licences and of taxes and assessments, the board of assessors and the banking commission. The sinking fund commission consists of the mayor, controller, president of the board of aldermen, city chamberlain and chairman of the finance committee of the board of aldermen, *ex officio*. The department of licences, under a commissioner appointed by the mayor, is responsible for the licensing and supervising of about 35 different businesses, including public amusements. The licensing of public hacks is, however, vested in the police department, and a number of other forms of licence are under supervision of departments particularly concerned with inspection, as the health and fire departments. The board of aldermen determines the general conditions of licensing. Collection of licence fees is commonly made by the department issuing the licence.

Police.—The police department has about 18,000 officers and employees, of whom about 300 are not uniformed. It is under the direction of a civilian commissioner, who receives \$10,000 a year and serves also as *ex officio* member of the city ambulance board, the board of health, and the parole commission. He is appointed by and removable at the pleasure of the mayor. The headquarters of the police department is in Manhattan. There are 40 precinct station houses in Manhattan, 32 in Brooklyn, 10 in Queens and 3 in Richmond. The administrative activities of the department are carried on through the commissioner and five deputy commissioners, while the uniformed force is under the supervision of a chief inspector. A significant feature of the police department is its academy, through which all recruits must pass. The total appropriation for the police department for 1928 was \$44,903,708.40, of which \$41,186,320.40 was allotted for personal service.

Fire.—A fire commissioner at \$10,000 a year, appointed by and removable at the pleasure of the mayor, heads the fire department, which has a personnel of about 7,200, of whom about 6,200 are in the uniformed force. At the head of the uniformed force and in charge of fire-fighting is the chief of the department, who receives \$12,500 a year. The department is divided into several bureaux, namely, fire extinguishment, prevention and investigation, and hazardous trades. Ninety-five engine and 50 hook and ladder companies are maintained in Manhattan and the Bronx; Brooklyn and Queens have 111 engine and 61 hook and ladder companies; Richmond, 11 engine and 6 hook and ladder companies. In addition, there are two special rescue companies. In the fire extinguishment service, third and fourth grade firemen receive \$1,769 a year, first grade firemen \$2,500 a year. In these classes there are approximately 5,000 men at all times. The total appropriation for the fire department was \$19,957,678.30 in 1928, of which \$18,677,818.30 was for personal service. The latest available statistics (1926) put the annual fire loss of the city at \$21,671,755. A fire college is conducted by the department.

Health and Hospitals.—In 1925 the general death rate was

11.49 per 1,000 population. The lowest rate was 11.08 per 1,000 in 1921. In 1898 the general death rate was 20.26. New York was the first American city to undertake health inspection of school children when it appointed a physician for this work in 1892, and in 1905 it inaugurated another health service for children, namely, the appointment of school nurses to assist physician inspectors. In 1908 the first American division of child hygiene was

CHART SHOWING RISE IN DEATHS FROM AUTOMOBILE ACCIDENTS IN NEW YORK CITY. FIGURES FROM THE REGISTRAR OF RECORDS, DEPARTMENT OF HEALTH, NEW YORK CITY

established in the city health department to co-ordinate, under a single director, all of the various activities for the promotion of child health. Infant mortality in the city has been reduced since 1910 by half. In 1925, the birth rate was 20.60 per 1,000 population, the lowest on record.

The health department is under the administration of a board of health, comprising the commissioner of health and one physician, both appointed by the mayor, and the police commissioner, *ex officio*. The health commissioner is the executive head at a salary of \$10,000 a year. There is an advisory board of 18 unpaid physicians appointed by the mayor. Borough health offices are maintained under the direction of assistant sanitary supervisors. The professional and technical services are divided among eight major bureaux; *i.e.*, foods, sanitation, records and statistics, field medical service, nursing, hospitals, research and laboratories, and health education. All employees are appointed through civil service. As a part of general preventive and educational work, the department conducts 70 baby health stations. It also maintains 21 dental clinics and 11 eye clinics for children, and two advisory clinics for venereal disease patients. Its personnel, including all hospital, baby health station and clinic employees, numbers about 2,000. Its appropriation for 1928 was \$6,408,276, of which \$5,103,341 was for personal service. The U.S. Public Health service manages the Quarantine station at Rosebank, S.I., where incoming vessels are inspected for quarantinable diseases; and units are provided on Hoffman island in the Lower bay for the care of incoming passengers suspected of having contracted these. The medical inspection of immigrants at the Ellis island immigration station is also made by this service which is also in charge of three U.S. marine hospitals in the New York zone. Among the great number of unofficial agencies chiefly concerned with health betterment within the city and its environs, the following deserve special mention: the New York Tuberculosis and Health Association, New York Diet Kitchen Association, Henry Street Settlement, Maternity Center, Committee for Health Service among Jews, New York Child Welfare Committee, Committee on Maternal Health, Judson Health Centre, East Harlem Health Center and Public Health Committee of the New York Academy of Medicine. The Catholic Charities of the Archdiocese of New York, the Association for Improving the Condition of the Poor, the Charity Organization Society, the Children's Aid Society, and the Jewish Social Service Association also concern themselves with public health.

Not including proprietary hospitals, of which there are about 50,

New York has 134 general and special hospitals which are available for the care of the sick of all classes. Of these 27 are municipal hospitals and 114 are maintained as tax-free institutions by private agencies. Recent estimates place the total number of hospital beds in the city at about 32,000 or five beds per 1,000 population not including beds in hospitals for the insane. The 27 municipal hospitals account for about one-half of the total number of beds. In addition to the municipal and private hospital services, there are two hospitals for the insane under the direction and control of the New York State department of mental hygiene; *i.e.*, the Brooklyn State hospital of 1,589 beds, and the Manhattan State hospital of 6,516 beds. The municipal hospitals beginning Feb. 1, 1929, are now administered by a newly created department of hospitals headed by a commissioner appointed by the mayor. Among the more important city hospitals are the Bellevue, Harlem, and Gouveneur general hospitals, in the borough of Manhattan; Fordham, a general hospital in the borough of the Bronx; and Neponsit Beach, a hospital for bone tuberculosis in the borough of Queens, the city and metropolitan hospitals on Welfare Island and five hospitals for communicable diseases. There is also the Reception hospital for classification. Although the municipal hospitals are free to indigent patients, all except the communicable disease hospitals conducted by the city health department have fixed charges for service, varying from 80 cents to \$2.25 per day. Of the total days' service rendered by the 56 hospital members of the United Hospital Fund in 1925, 47% was free.

Among the chief private general hospitals are Mount Sinai, St. Luke's, Presbyterian, New York, Roosevelt, Lenox Hill and the Post Graduate. All of these hospitals are in the borough of Manhattan. In Brooklyn are the Long Island College hospital, Jewish, Brooklyn and Methodist Episcopal. Of the private special hospitals for women and children, the Lying-in, Sloane Maternity, Nursery and Child's, Woman's and Misericordia are the largest. Other special hospitals of note are the Orthopaedic, Ruptured and Crippled, Joint Diseases, New York Eye and Ear infirmary, Manhattan Eye, Ear and Throat hospital, Skin and Cancer hospital and Neurological institute.

Forty of the general hospitals, municipal and private, operate about 100 public ambulances. This service is under the control of a board of ambulance service. Among the recent events of interest in connection with the private hospital services of the city is the establishment of the Presbyterian-Columbia Medical centre. New buildings on an extensive scale are now partly completed on a site at the northern end of Manhattan, with the view of bringing together in close physical and administrative relationship the Presbyterian hospital, the College of Physicians and Surgeons of Columbia university, and a group of other special hospital services including the Babies hospital, the Neurological institute, and the Sloane Maternity. Funds have been appropriated by the State to establish a State psychiatric institute and hospital at the Medical centre.

Charities.—The department of public welfare is under the direction of a commissioner appointed by the mayor at a salary of \$10,000 a year. It is responsible for inquiry and disposal of all cases of applications for public relief, the care of the dependent sick, mentally defective and epileptic; the relief of veterans and their families; the distribution of funds for the relief of the poor adult blind of the city; the receipt and disbursement of funds for the support of children of unmarried mothers; the inspection of private institutions for adults and children; the regulation of public solicitation of funds; and the collection of money from parents and relatives in part payment for the support of public charges. The department of public welfare also maintains the Municipal lodging house.

The city board of child welfare comprises ten members appointed by the mayor, three of whom must be women. The members of this board receive no compensation. The board grants allowances to needy and worthy widows whose husbands were citizens of the United States and residents of the State of New York at the time of their death. Allowances are also made to mothers whose husbands are confined in prisons or are otherwise incapacitated.

tated for earning. For these purposes the city appropriated \$6,126,946 for 1928.

The work of the official agencies above described represents only a small part of the charitable services available to dependent or handicapped persons. A major share of the institutional care of dependent sick and otherwise incompetent is provided by unofficial agencies and institutions, many of which are in part reimbursed for their services in the care of persons properly public charges. The city appropriated for the current year (1928) \$8,430,669.75 for the care of dependents in private hospitals, homes and other institutions. The burden of outdoor relief and family welfare work of the poor is borne by private agencies. In all, there are several hundred organizations dealing with one phase or another of relief and family welfare not including the many semi-social, fraternal, or mutual benevolent organizations. Several of the more important charitable and benevolent organizations work in close association at the United Charities building. To bring about a more general co-operation of charitable and benevolent organizations, the Welfare council of New York city was established in 1925 by the voluntary association of about 500 public and private social agencies, which for purposes of co-operative action were grouped in four divisions: family welfare; child welfare; health; recreation, education and neighbourhood activities.

Corrections.—The department of corrections is under the direction of a commissioner of corrections appointed by the mayor at a salary of \$10,000 a year. It supervises the three city prisons of Manhattan (The Tombs), Brooklyn and Queens, the 11 district prisons, and New York County penitentiary and the Correctional hospital; the Municipal Farm and the Reformatory prison; the New York City Women's Farm colony; the Warwick Dairy farm; and the New York City reformatory.

The city parole commission consists of the commissioner of corrections and the police commissioner, *ex officio*, with three members appointed by the mayor, one of whom is chairman of the commission at a salary of \$7,500 a year. It supervises persons released from city correctional institutions prior to the expiration of their sentences, and while still in the custody of the State. A probation bureau is maintained under the general direction of the chief magistrate of the magistrates' courts of the five boroughs. A chief probation officer directs this bureau. The probation officers conduct, at the direction of the magistrates, investigations of defendants prior to sentence and receive on probation and supervise delinquents. The five borough children's courts supervise juveniles on probation. Many charitable associations receive aid from the city to care particularly for delinquent women and children. Other correctional agencies, several of which also receive public funds and furnish special services to the city in dealing with correctional problems, are the Societies for the Prevention of Cruelty to Children; the House of Refuge; New York Society for the Suppression of Vice; Salvation Army; Volunteers of America; Woman's Prison Association; Prison Association of New York; House of Good Shepherd; New York Catholic Protector; Society for the Prevention of Crime; Jewish Board of Guardians; Joint Committee on Methods of Preventing Delinquency; Big Brother Movement and Big Sisters.

Public Water Supply.—In the early days, the water-supply of New York was derived from wells and from streams and ponds. In 1799, the Manhattan company was incorporated ostensibly to supply the city with water, but under a clause in its charter, devoted itself primarily to the banking business. In 1834 the legislature authorized the city to begin the necessary works to bring water from the Croton watershed more than 30 m. north, and the first Croton water was delivered to the city in 1842 through the Croton aqueduct. In 1883 the new Croton aqueduct was authorized and thus additional water became available in 1890. In 1905 the board of water-supply was created and work was begun immediately on a new system to bring water from the Catskill mountains, more than 100 m. north. This commission developed an additional water-supply from the Esopus and Schoharie watersheds with a total dependable yield of about 600 million gallons daily flowing through the Catskill aqueduct. In the

year 1927 an average of about 570 million gallons of Catskill water was used daily.

The Catskill aqueduct delivers its water just north of the city line into Hill View reservoir, which has a storage capacity of 900 million gallons. From the Hill View reservoir, Catskill water is delivered into the five boroughs of the city by a circular tunnel in solid rock at depths varying from 200 ft. to 750 ft. below the street level, and reducing in diameter from 15 ft. to 11 feet. The total cost of the Catskill water-supply system was about \$185,000,000. The average daily consumption of water in New York city for 1927 was about 875 million gallons. The present public water-supply systems provide a dependable yield of about 1,050 million gallons per day.

Sewers.—There are more than 2,800 m. of sewers, over one-third of which lie in the borough of Brooklyn. The sewers in the older and more densely settled sections are generally on the combined plan, serving for storm water as well as for domestic and industrial waste. In Manhattan many of the sewers are egg-shaped, with a minimum size sufficient to enable them to be entered and cleaned by hand. In Brooklyn, the Bronx and Queens, the extensive low-lying areas have required the construction of large trunk sewers which have generally been of concrete. The older sewers were of brick or vitrified pipe, although for many years cement pipe was employed for the smaller sizes in Brooklyn. There are approximately 840 m. of concrete sewers, 570 m. of brick sewers, 1,400 m. of vitrified clay pipe, and 25 m. of cast iron pipe sewers in the city, which, in the main, empty into the rivers and tidal waters. With the growth of population, the pollution of the harbour has increased, with the result that fine screening has been resorted to where this will suffice, and at those points where a higher degree of purification is considered necessary, land has been secured for the establishment of activated sludge treatment plants. Plans are now being prepared for the first of these plants on Ward's island.

Public Works.—The commissioners of public works control the bureaux of audits and accounts, design and survey, sewers, highways, public buildings and offices and the bureau of buildings. There are in addition 24 local improvement districts; for each district there is a local improvement board.

The work of the street cleaning department includes the collection and disposal of all municipal waste. Snow removal is one of the most costly and difficult problems; in the winter of 1924-25, when there was a total snow-fall of 27 in., its removal cost over \$5,000,000. For the collection and disposal of garbage, ashes and rubbish (about 15 million cubic yards annually), over 9,000 persons are regularly employed. Garbage is disposed of by incineration in the boroughs of Queens and Richmond, but that of the other and larger boroughs is loaded on scows and towed to the open sea about 30 m. beyond Scotland lightship, where it is dumped. Ashes and rubbish are in the main utilized for land fills in the several boroughs. The total appropriation for the department of street cleaning for 1928 was \$27,302,644.33, of which \$20,128,374.33 was for personal service.

City Planning and Zoning.—The Greater New York charter adopted in 1898 provided that the responsibility for laying out street systems should be primarily vested in the borough presidents with specific approval resting on the board of estimate and apportionment, and independent approval by the mayor for changes in plan. In 1903 the board of aldermen created an improvement commission which reported in 1907. In 1913 a heights of buildings commission was created. This led to the building zone resolution of July 25, 1916, which regulated the height and bulk of buildings thereafter erected and the boundaries for trades and industries. This resolution divided the city into "use," "height" and "area" districts. The "use" districts are: (1) "residence," where no building can be erected other than for specified uses, such as dwellings, clubs, hotels, etc.; (2) "business" where specified trades considered as either offensive or dangerous are prohibited; and (3) "unrestricted," where no zoning regulations or restrictions are provided. The "height" districts provide for "setbacks" in buildings erected in excess of certain heights, the height and extent of the "setbacks" depending on the

width of the adjoining streets. There are five "area" districts designated as A, B, C, D and E, and the size of court and rear yard required bears a definite ratio with the height of the building. Changes in the zoning resolutions of 1916, and amendments thereto are vested in a standing committee of the board of estimate and apportionment, called the City Plan and Public Improvements Committee. Appeals from the actions and decisions of the different superintendents of buildings and officers of the fire department who are charged with the enforcement of zoning regulations are made to the board of standards and appeals.

Public Markets.—The commissioner of public markets, who is appointed by the mayor, has jurisdiction over all public markets, market-places and lands, and all auctioneers of foods and permits and leases for business. He also supervises the manufacture and sale of ice. The chief markets for foodstuffs are the Washington, West Washington, Gansevoort, Harlem, Westchester and Wallabout market and the Bronx Produce house. A terminal market is under construction in the Bronx. A picturesque feature of the city's congested foreign districts is the open air push-cart market. There are 58 of these and their yearly business amounts to millions of dollars.

Parks and Recreation.—Administration of the parks of the city is vested in a park board of five members, who are the park commissioners appointed by the mayor for the five boroughs. The total park area of the 117 city parks, not including unimproved acreage and parked streets, is 9,312 acres. The largest of the parks are the Pelham Bay (Bronx), 1,756 ac.; Van Cortlandt (Bronx), 1,132 ac.; Marine park (Brooklyn), 1,099 ac.; Central (Manhattan), 840 ac. and Bronx, 719 ac.

Central park extends from 59th to 110th streets, between Fifth and Eighth avenues. It was purchased in 1856 for about \$5,500,000, and laid out and developed by the architects Frederick Law Olmstead and Calvert Vaux, under the direction of a board of 11 commissioners, the first committee of construction including William Cullen Bryant, Washington Irving and George Bancroft. Van Cortlandt, Pelham Bay and Forest parks are the largest generally devoted to outdoor sports and recreation. In Van Cortlandt park is the Van Cortlandt mansion built in 1748, and now maintained as a museum. The Bronx park is noted for its zoological and botanical exhibits and Prospect park for its beauty. Riverside park, in Manhattan, extends along the east bank of the Hudson river from 72nd to 129th streets, a distance of about three miles. Battery park was the site of "The Battery" in the early days of the city. The aquarium occupies the old Castle garden in this park. City Hall park constitutes a part of what was called "The Common Lands" in the middle of the 17th century. Roger Morris park is the site of the Jumel mansion, the home of Mme. Jumel, wife of Aaron Burr, and here Gen. Washington made his headquarters during the battle of Harlem heights. In Audubon park was the home of the naturalist John James Audubon. Poe park, in the Bronx, is the site of the Edgar Allan Poe cottage. In Fort Greene park, Brooklyn, is a vault containing the remains of a few of those who died in the British prison ships in 1776 and after.

Courts.—The judicial system of the city is composed of the following courts: magistrates' (minor offences); homicide; municipal term; night; family; traffic; woman's; probation; municipal (civil actions involving not more than \$1,000); city (civil actions involving \$1,000 to \$3,000); county (in New York this is the court of general sessions and in Richmond the county and surrogate's court are combined; major crimes); special sessions (chiefly misdemeanors); children's (children under 16, except murder in the first degree); and surrogate's (estates of infants and deceased persons). The mayor appoints about 70 city marshals.

VI. EDUCATION

Public School System.—The free public school system is administered as the department of education by an unpaid board of seven, appointed by the mayor, for terms of seven years. The school system comprises 662 public schools with an enrolment of over 1,000,000. There are 604 elementary, 37 high schools, 3 teacher training, 4 vocational and 14 compulsory continuation

schools. For each school district there is a local board of five appointed by the borough president for five years. Members receive no compensation and may be removed by the borough presidents after a hearing.

The chief executive officer of the board of education is the superintendent of schools who is elected by the board of education and sits with this body though without vote. He receives a salary of \$25,000 a year and holds office for six years. There are eight associate superintendents of schools. The superintendent and associate superintendents of schools constitute the board of superintendents. Teachers are chosen by the board of education from eligible lists of those who have qualified before a board of examiners of seven members appointed by the board of education. The total personnel of the department of education is estimated as 42,000. The appropriation (1928) was \$84,347,196.13, of which \$74,152,350.14 was for personal service. In addition it was estimated in that year that \$40,197,681.42 would be received from the State, making in all \$124,544,877.55, available for the department. A teachers' retirement system is administered by the teachers' retirement board of seven unpaid members.

Higher Educational Facilities.—The city provides such facilities in the College of the City of New York (co-educational), and Hunter college (women). The College of the City of New York, or City college, was established as the Free academy in 1847. The name was changed to the present one in 1866. The college occupies buildings of English Gothic style, constructed at a cost of over \$5,000,000. It has about 11,000 students, and \$2,169,855.24 were appropriated for it in 1928. Hunter college for women, originally intended as a teacher training school was established by the board of education in 1869 as the "Normal and High School." It has over 3,000 students. For this and its "annexes" \$2,199,605.96 were appropriated in 1928. In addition, New York is the seat of Columbia university (*q.v.*), and New York university, which was founded in 1831. In 1835, it moved to Washington square, and in 1891 added a site of about 48 ac. on University heights in the Bronx. It enrolls about 23,000 students. Fordham university (6,000 men students) was founded in 1841 as St. John's college. In 1846 it was turned over to the Jesuits and incorporated as Fordham university. It is situated in the Bronx. Long Island university (1928) in Brooklyn has facilities for about 400 students, chiefly in schools of law and medicine. The year 1928 also witnessed the opening of Yeshiva college (Jewish), which occupies new buildings of Ancient Semitic architecture situated in upper Manhattan. It has facilities for 1,500 students. Among the more important of the professional schools are: the General Theological seminary (Protestant Episcopal); Union Theological seminary (Presbyterian); Jewish Theological Seminary of America; Cornell university medical college; College of Physicians and Surgeons in the City of New York (Columbia university); University and Bellevue hospital medical college (New York university); New York Post Graduate Medical school and hospital; Homeopathic Medical college; Long Island university medical college in Brooklyn; Columbia university law school (Columbia university); Fordham university law school; New York law school; New York university law school; Brooklyn law school of St. Lawrence university; Brooklyn college of pharmacy; College of pharmacy of Columbia university; Fordham university college of pharmacy; School of Dental and Oral Surgery of Columbia university; Teachers' college of Columbia university; New York school of social work; the National Institute of Public Administration; and the New School of Social Research. The chief technical institutions are the Mechanics Institute school, founded in 1820; Cooper Union (*q.v.*); the Peoples institute for the promotion of adult education; and Pratt and Polytechnic institutes, both in Brooklyn. The New York State Nautical school is conducted on board the U.S.S. "Newport."

Libraries.—The first public library in New York was the Corporation library, established at the City Hall (1697-1701). Up to 1795 it remained at the City Hall and was the Library of Congress when New York was the nation's capital. It is now called the Society library. Other older libraries are: the Columbia university library (1754), that of the American Historical

Society (1804), and the Mercantile library, founded in 1820 by merchants' clerks. The municipal library system consists of the New York public library, serving Manhattan, the Bronx and Richmond; the Brooklyn public library and the Queens public library. (For the numerous and important special libraries in New York see *American Library Directory*, 1927.)

Art.—Most of the principal American sculptors have at some time resided in New York and it is here, frequently in inconspicuous places, that one finds their masterpieces. St. Gaudens is represented by his "Peter Cooper," the equestrian statue of Sherman, the Admiral Farragut statue, the bronze relief of the Rev. Henry W. Bellows and other works; John Quincy Adams Ward, by the "Pilgrim," "Shakespeare," "Indian Hunter," and a monumental bronze Washington; Frederick W. MacMonnies by his "Nathan Hale," "Civic Virtue," "Horse Trainers and a Quadriga"; Daniel Chester French by the "Alma Mater"; and George Gray Barnard by a fountain at Columbia; Karl Bitter by an "Abundance" and an equestrian statue of Franz Sigel; Anna Hyatt by a "Jeanne D'Arc"; Kirke Brown by an equestrian Washington; F. Auguste Bartholdi, the French artist, by a "Lafayette"; H. P. Proctor by a bronze group of panthers; and Edward Kemeys by a "Still Hunt." On the front of the Public library is Paul Bartlett's statue, and a group by Albert Weinter depicting the purchase of Manhattan island is in the City Hall of Records. The bronze "Statue of Liberty" of Bartholdi, the gift of France to commemorate the 100th anniversary of American independence, rises from Bedloe's Island 300 ft. above the harbour.

Central and Prospect parks are adorned with many examples of fine statuary, and unfortunately, also, with many which are lacking in merit. Many sculptors are represented in the busts of great Americans in the Hall of Fame at New York University.

A few striking examples of 18th and early 19th century architecture still remain, notably St. Paul's chapel, designed by Mac-Bean and built in 1764, the old church of St. Mark's-in-The-Bouwerie, completed in 1799, and City Hall, the work of Mangen and Macomb, completed in 1811. Renwick designed the Gothic Grace church, completed in 1845, and St. Patrick's cathedral, which was built between 1858 and 1879. After the Civil War Richard M. Hunt, a graduate and teacher in the Paris School of Fine Arts, began his American career. Among his first works were the recently demolished French chateau of William K. Vanderbilt, the Astor and Gerry houses and the Tribune building. George B. Post designed many beautiful residences, the Times and World buildings and the Produce and Cotton exchanges. Charles F. McKim, William R. Mead, and Stanford White were designers of the old Madison Square Garden, the Washington arch and the Metropolitan club. R. H. Robertson is known for his work on the American Tract Society and United Charities buildings and the Corn exchange bank. Carrère and Hastings planned the National Academy of Design and the New York public library; H. I. Hardenburg the Waldorf, Savoy and Manhattan hotels, and the American Fine Arts building; and Ernest Flagg the Singer building, St. Luke's hospital and the Scribner building. The chief collection of art objects in America is in the Metropolitan Museum of Art.

The art commission of the City of New York was established in 1898, being the first American municipal organization designed to protect a city against inferior structures and memorials. It passes judgment upon designs for buildings, bridges, statuary, gates, etc., and upon all alterations in existing works of art.

Music.—In the first quarter of the 19th century, the Park theatre became a famous stage for dramatic and musical art. In the '40s and '50s the musical centre was Tripler hall on lower Broadway, which became Metropolitan hall in 1854 and then, following its destruction by fire shortly after, was rebuilt and rechristened the New York theatre and Metropolitan opera house. Later its name was changed to the Winter Garden. The present Metropolitan opera house was built in 1883. In the latter half of the 19th century several other large halls for musical recitals were opened, notably, Steinway, Chickering, Hardman and Carnegie halls, the last named being the largest auditorium available in this period. It was in the middle and latter part of the

19th century, however, that the musical history of New York really began (see *MUSIC: United States*).

Literature.—Cadwallader Colden, author of the *History of the Five Nations* (1730) was perhaps the first New York author of general reputation. The first authors' club, the Ancient club of New York, was founded in the latter part of the 18th century and later included among its members Washington Irving, Fitz-Greene Halleck, James Kirk Paulding and Joseph Rodman Drake. A little later John James Audubon, Richard Henry Dana, James Fenimore Cooper, Edgar Allan Poe, William Cullen Bryant, John Bigelow, Julia Ward Howe and Robert Bonner were members of New York's literary life. In the 19th century the Bread and Cheese club brought together a most creditable group of writers. As the country expanded, however, the influence of New York upon letters declined somewhat although it is the centre of American printing and publishing. The chief society of authors having headquarters in New York is the American Academy of Arts and Letters. Other notable literary organizations are the Society of Arts and Letters, Authors' Guild, Catholic Writers' Guild of America, New York Drama League, American Dramatists, Grolier Club, Century Association and League of American Pen-women.

Scientific Collections and Learned Societies.—Chief of the scientific collections is that of the famed American Museum of Natural History. The Aquarium at Battery park and the Zoological park in Bronx park are both under the control of the New York Zoological Society (see *AQUARIUMS, U.S.*).

The Botanical garden in Bronx park occupies about 400 ac. The museum contains a library, collections with about 1,500,000 specimens and research laboratories; \$230,000 were appropriated for the Botanical garden in 1928. The Brooklyn Institute of Arts and Sciences maintains another large botanical garden. (For the Museum of the American Indian [Heye foundation] see *MUSEUMS*.)

The Hispanic Society of America, founded by Archer M. Huntington, maintains an excellent museum of Spanish and Portuguese paintings, manuscripts, maps, coins and antiquities. Other interesting collections are in the Museum of the American Numismatic Society, containing exhibits of medals and coins of all countries and of all periods, and the American museum of Safety (Industrial safety appliances).

The New York Historical Society, founded in 1804, is the most important for material on New York State history. The Long Island Historical Society of Brooklyn and the New York Genealogical and Biographical Association, founded in 1869, are notable in this field. The Quadrangle at Broadway and 156th street is the location of the American Numismatic Society, the Geographical Society of New York, the Museum of the American Indian and Hispanic Society of America. The New York Academy of Medicine, established in 1847, and the Academy of Political Science at Columbia University, founded in 1880, also deserve mention. (See *SOCIETIES, LEARNED*.)

(For New York city press data see *PUBLISHING; PRESS; NEWSPAPERS*. For foundations see *CARNEGIE TRUSTS; ROCKEFELLER FOUNDATION*, etc.)

VII. THEATRES, CLUBS AND CHURCHES

Theatres, Arenas and Exhibitions.—The first dramatic performances in New York were probably those given in a building in Pearl street by a company of actors from London in 1732. Another company from London came to New York in 1749. The real beginning of the permanent theatre in New York was, however, in 1750, when a company under the management of Kean and Murray came from Philadelphia and established themselves in a house on Kip street (now Nassau), between John street and Maiden Lane. Lewis Hallam arrived in 1753 from Virginia and erected a theatre in Nassau street, the first building constructed for theatre purposes, and opened it in 1753 with *The Conscious Lovers* and *Damon and Phellda*. The first performance of *Romeo and Juliet* was given at this theatre in 1754 with Mrs. Hallam as Juliet. This theatre was abandoned the same year and was converted into a church by a society of Calvinists. The next

theatre was at Cruvers wharf on the East river and was opened by David Douglass in 1758 with *Jane Shore*. Douglass also opened another theatre at the corner of Nassau and what is now Beekman street in 1761 with *The Fair Penitent* and later gave the first performance of *Hamlet* in New York; he also established the John Street theatre, in 1767. This theatre flourished until the Revolution and during the British occupancy of the city was used for amateur theatricals. After the British evacuation, Washington and his generals were frequent patrons of this theatre.

In 1798 was created a three storey stone theatre "The Park," between Ann and Beekman streets on Park Row, for Hallam and Hodgkinson. This building was a very magnificent one for its time, costing about \$180,000. The story of the theatre in New York for the next 50 years is largely the story of the Park theatre (see **DRAMA: United States**). In 1837 New York had five theatres, the Park, Bowery, Olympic, Chatham and Richmond Hill. Palmer's opera house was built in the '40s as was also the Astor Place opera house, where the Astor Place riot occurred as the result of a dispute between friends of the American actor Forrest and his English rival Macready. Twenty-two persons were killed and about 40 were wounded by the militia called to quell the disturbance. In 1847, P. T. Barnum brought Jenny Lind to America for a series of concerts which began at Castle Garden at the Battery. Similar "pleasure gardens," as Niblo's, the New York, Cold Spring, East River, Vauxhall and Ranleigh, were utilized for concerts and other performances for which the capacity of theatres was inadequate. The Crystal Palace in Murray Hill was also a great amusement centre in the early '50s. By the middle of the century the theatrical district was well established in the neighbourhood of Union square, which was also the shopping centre. The Academy of Music, the Union Square, Irving Place and Wallack's were the chief theatres in this area. By 1870 23rd street had become the upper limit of the theatrical and shopping centre, with the Fifth Avenue theatre and Booth's. Ten years later the theatres had invaded the lower '30s with Daly's, the Standard, Wallack's and the Casino. In 1883 the erection of the Metropolitan opera house at 39th street started an invasion of the '40s and by the end of the century, 42nd street had become the real centre of the theatrical district as it is to-day. The present theatre district comprises roughly a strip of Manhattan extending from 14th to 59th streets, and from Fifth to Eighth avenues. Broadway cuts diagonally across the strip and in the language of the district is the "main stem" to which the cross streets are tributary. In this area there are to-day about 200 theatres, including those in which moving pictures are a part of the programme. According to the best available data, there are in all 414 theatres in Greater New York, including those exhibiting moving pictures as part of their entertainments. Among the largest are: Roxy (5,920), the Hippodrome (5,190), the Capitol (4,624), the Academy of Music (3,600), Paramount (3,528), and the Metropolitan opera house (3,305). Most of the theatres exhibiting the "legitimate" drama or musical comedies only are of less than 2,000 capacity (see **STADIUM**). It is estimated that in the theatre district alone, approximately 300,000 people attend the theatres daily. (See **THEATRES; DRAMA**.)

Clubs.—Club life in New York is less significant now than in the earlier part of the present century before the development of the apartment house hotels, the change in social habits and customs coincident with the expansion of business and trade into former residential districts, and the exodus from the city into suburban areas of so many of the leisured class who formerly sought city clubs for recreation and entertainment. The first social organizations of importance were the authors' Bread and Cheese club (1824), and the artists' sketch club (1829). It was not until 1836, however, that club life in New York really began with the founding of the aristocratic Union and Hone clubs. The Knickerbocker (1871), was also the resort of the descendants of original New York settlers. The St. Nicholas was formed a little later for those whose ancestors were early residents of the colonies. The Metropolitan (1891), with its costly house, was in fact a protest against the exclusiveness of many of the older clubs. The Union League (1863) was established for the purpose of aid-

ing the Union, and its first work was the organization of regiments of coloured troops. To offset this Republican influence, the Manhattan was organized in 1864 to advance Democratic ideals, although this is not now greatly emphasized.

The chief sport and athletic clubs are the New York Yacht (1844), the New York Athletic (1868) and the Racquet and Tennis. Other important clubs with more or less specialized interests are the Advertising Club of New York, Automobile Club of America, the India House, Army and Navy, Architects, City, Colony, Engineers, Friars, Lambs, Players, Lotos, Century and Salmagundi clubs. A score or more of the great office buildings in down-town New York contain luncheon clubs, such as the Downtown Association, the Lawyers, Bankers and Whitehall.

Churches.—The Dutch Reformed Church (1628) was the first church in the city and is to-day known as the Collegiate Church of New York city. The Presbyterians organized here as early as 1638 and were tolerated by the Reformed Church, but it was not until the English occupancy that they made their influence felt. In 1719, the first Presbyterian church was built in Wall street; there are about 100 to-day. It was not until 1847 that a Congregational church attained great prominence in New York, when the Plymouth Church of Brooklyn was founded with Henry Ward Beecher as pastor. The Congregationalists now number about 50 active churches. In 1664, the Lutherans obtained permission from the English Governor Nicolls to establish a church. The first Lutheran church was at Broadway and Wall street, the site of the present Trinity church; they grew rapidly and now number over 200 churches and chapels. The Protestant Episcopal Trinity church was built in 1697 at Broadway and Wall street where the present Trinity (1790) now stands. St. Paul's chapel (1776), at Broadway and Vesey street is the oldest church edifice in the city; Grace, St. Thomas's, the Church of the Transfiguration, familiarly known as "The Little Church Around the Corner," and the great Cathedral of St. John the Divine, at 110th street and Morningside avenue, are other notable Episcopal churches. The first Methodist church (1768) was erected in John street. African Methodist Episcopal churches for negroes have a large membership. The first Baptists in New Amsterdam (1657), received little consideration at official hands and met in a private house in Broad street in 1715. In 1762 they built a church in Gold street. At present, they have about 120 churches, some of the largest being for negroes. St. Peter's (1785) was the first Roman Catholic church and in 1808, New York was made the seat of an Episcopal see. In the years prior to the Civil War the Catholic Church grew rapidly. In 1858, the present St. Patrick's cathedral at Fifth avenue and 51st street was begun, and in 1879 it was dedicated. It is the eleventh in size among cathedrals and seats about 18,000 persons. There are about 400 Catholic churches. Besides other Christian groups there are numerous flourishing Jewish congregations, some of them of considerable age. There is also a number of undenominational churches and missions.

VIII. HISTORY

New York bay and Hudson river were probably first discovered by Giovanni da Verrazano, an Italian navigator, in 1524, and seen also by Estéban Gómez, a Portuguese, in 1525. It is commonly stated that the first competent exploration of New York bay and its environs was made by Henry Hudson in the "Half Moon" in Sept. 1609. But there is in Paris a map dated (1570) which shows in considerable detail the topography near the mouth of the Hudson. In 1611 Adrien Block came to Manhattan island and returned to trade for furs with the Indians. In 1614 he explored the harbour of Manhattan and its adjacent waters and was probably the first European to enter Long Island sound. The States-General of Holland granted a charter to the New Netherland Company giving it the exclusive right to trade in New Netherland for four voyages, to be made within three years from Jan. 1, 1615. In 1615 the company built a storehouse and fort on the south end of Manhattan and a few huts sprang up around it. On Jan. 1, 1618, the charter expired. In June 1623 New Netherland was formally established as a province of the West India company.

The next year a party of about 30 Protestant Walloon families arrived. Of these colonists only about eight men remained on Manhattan, the remainder going to establish Ft. Orange where Albany now is. The next year more colonists came, and when director May gave way to director Van der Hulst, the colony numbered almost 200 persons. The government of the New Netherland province was vested in a director general and a council.

PETER MINUIT NEGOTIATING THE PURCHASE OF MANHATTAN ISLAND FROM THE INDIANS, 1626. AFTER THE PAINTING BY ALFRED FREDERICH

These officers, though formally appointed by the company, were subject to the approval of the States-General. The first director-general, Peter Minuit, arrived with additional colonists in 1626, purchased Manhattan island from the Indians with pieces of bright cloth, beads and other trinkets to the value of 60 guilders or about \$24, erected Ft. Amsterdam at the lower end of the island, and made New Amsterdam the seat of government. Wouter Van Twiller, who succeeded him in 1633, was recalled in 1637 because of his mismanagement. Under the wise rule of Peter Stuyvesant (*q.v.*) the province prospered and, at the time of the transfer of New Netherland to English control, the population stood at about 10,000 (*see* *NEW YORK: History*). In 1658 Stuyvesant established a "Rattle Watch" of eight men which may properly be called New York's first police force. The strife between the English and Dutch went on until 1664, when Col. Richard Nicolls took possession of the city without bloodshed on Sept. 8, 1664. The English flag was raised over the fort, which was renamed Ft. James, and New Amsterdam became New York.

The rights of the Dutch settlers were carefully maintained at first, and established institutions changed only gradually. The English reorganized the city government (1665) with a mayor, aldermen and sheriff to be appointed by the governor of the province for a term of one year, and also extended the city limits to include all of Manhattan island. The Dutch reoccupied the city from July 30, 1673, to Nov. 9, 1674, when Colve surrendered to Sir Edmund Andros, the new English governor. Andros restored the English form of city government. The next hundred years is in the main a record of continuous struggle for control of the city government between the royal agents and the inhabitants. There were good and bad governors, but none was capable of stemming the tide of popular demand for greater freedom of self-determination. The first serious break in English resistance came with the refusal of the merchants of New York and other parts of the province to pay certain duties exacted by the "Duke's Laws." Governor Thomas Dongan called the first New York assembly on Oct. 17, 1683, and to this body freemen were permitted to elect representatives. Dongan's régime is notable also for "Dongan's Charter," which was granted the city in April 1686 and whereby sources of income were vested in the city corporation, all previous rights and privileges being confirmed and conveyed to the corporation, including the proprietorship of the City Hall, the market houses, bridges, wharves, docks, cemeteries, ferries, unoccupied lands, and the waters within the city. The city seal presented to the corporation the same year is that which it now employs with its motto *Sigillum Civitatis Novi*

Eboraci, except that an eagle was substituted for the royal crown in 1784. Under the rule of Jacob Leisler (1689-91) the people were permitted, for the first time, to elect their own mayor, Peter De Lanoy, a privilege that lapsed until 1834. Sloughter, Leisler's successor, appointed as mayor Abraham DePeyster, a young, cultured and popular man of irreproachable character. He was effective in conciliating the warring factions, and responsible for many public improvements. The old "rattle watch" or police of the city was reorganized by DePeyster in 1697, and placed again under civil control. DePeyster built new wharves, provided the first system of poor relief, and instituted sanitary betterments. Business prospered in spite of the unrest in the province as a whole. Pirates in and about New York were a source of constant irritation, and Governor Benjamin Fletcher, who had succeeded Sloughter, was even suspected of being in league with them. They were finally dispersed by Bellomont, Fletcher's successor, and a measure of confidence in the government restored. But the incompetence of governors Cornbury and Lovelace increased resentment against English government; and its appointed mayors, though in the main men of good standing, were so frequently changed that none except William Peartree (1703-1709) made noticeable impressions upon municipal affairs. Peartree established the first free grammar school and a school for negro slaves. He also improved the jail and provided a debtor's prison in the City hall. Governor Robert Hunter, a cultured gentleman, who took office in June 1710, was more tactful than his predecessors; but his régime was ten years of turmoil. In April 1712, insurgent negroes massacred nine white men and wounded many more. Twenty-one negroes were legally executed, some in a most barbaric manner, and a large number of others, innocent as well as guilty, were imprisoned. Broadway was graded from Maiden Lane to the Commons, under Mayor Caleb Heathcote, and a new Presbyterian church was built. In 1725 under Governor William Burnet, William Bradford established the first New York weekly paper, the *New York Gazette*. In 1731 the city imported a fire engine from London. In 1733, John Peter Zenger, proprietor of the *New York Weekly Journal*, was charged with libelling Governor William Cosby and was brought to trial, but was so ably defended that the jury exculpated him almost without deliberation. This was regarded as establishing the freedom of the press. A "negro plot" against the whites was "revealed" by an irresponsible servant girl in 1741. Thirty-four negroes were killed, 24 whites thrown into jail, and suspicion fell upon many prominent people. In 1742 the paid civil patrol was abandoned and an unpaid citizens' watch established. This was so unsatisfactory that in 1747 a military watch was reinstated and continued until 1762, one year after the inauguration of street lighting.

IX. INDEPENDENCE

By the middle of the 18th century New York city was regarded as the focal point of resistance to royal authority. A majority of its leading citizens were descendants of the Dutch patroons, intelligent men and women who, though loyal to the English Government, were fully aware of its incompetency in America. Governor George Clinton, who returned to England in 1753 after a stormy rule of ten years, turned over the government to Sir Danvers Osborne on Oct. 7. The next day, Osborne's body was found hanging in the garden of his home. Chief Justice DeLancey took oath as lieutenant governor and became acting governor. On Oct. 31, 1754, DeLancey signed the charter of King's college (now Columbia university, *q.v.*), which had been established in 1753 in the vestry room of Trinity church. News of the capture of Quebec by Montcalm in 1759 was hailed in New York with great enthusiasm, and causes of resentment against English rule were soon supplied by the imprisonment of New York sailors by British men-of-war in the very harbour of the city. When copies of the Stamp Act reached New York, it was denounced by the newspapers. On Oct. 7, 1765, the Stamp Act Congress was called at the City Hall, with representatives from all provinces. While the congress was still in session on Oct. 23, a British ship arrived loaded with stamps, and in the face of the resistance of the people

the fort prepared itself for defence. On Nov. 1, 1765, a band of the Sons of Liberty hanged Governor Colden in effigy at the very door of the fort, and then burned the houses of several prominent officials. Mayor John Cruger finally induced Colden to turn over the stamps to the city corporation; but the Sons of Liberty were firm in their resistance to the enforcement of the Stamp Act and it was finally repealed on March 18, 1766. New York went wild with excitement and the Sons of Liberty on June 4 erected a liberty pole in "The Fields" (City Hall park), where a replica now stands. Rioting between the Sons of Liberty and the British soldiers was of almost daily occurrence and finally, in 1770, Mayor Hicks issued a proclamation forbidding soldiers to leave the barracks unless accompanied by an officer. The liberty pole, which had been erected and cut down several times, was finally put up on the Commons and inscribed "Liberty and Property." But with the arrival of Sir William Tryon as governor, in July 1771, it became apparent almost at once that the temporary peace would shortly end. News that a tea ship was on its way to New York to carry out Lord North's purposes of taxation was received with violent expressions of defiance throughout the city. The Sons of Liberty reorganized to stir up resistance. When the ship reached New York, on April 7, 1774, its landing was refused, a few chests of tea were thrown into the bay by a committee of the Sons of Liberty previously appointed, and the ship sent home to England. The closure of the port of Boston was the signal for the calling of a meeting at Fraunces' tavern and the election of a Committee of Fifty-one, which issued the call for the first congress of the Colonies. The Committee of Fifty-one was dissolved with the election of a new committee of observation to enforce in New York the Nonimportation Act of the First Congress. From this time on events moved swiftly. On April 23, 1775, news of the Battle of Lexington reached New York. A mob took possession of City Hall and seized munitions stored there. Two British ships in the harbour were seized and their cargoes unloaded. The Committee of Sixty called for the election of a new Committee of One Hundred to arrange for calling a war congress of deputies from all New York counties. The provincial congress met in New York and declared obedience to the Continental Congress, while reserving their right of internal control. On June 25, Gen. Washington arrived in New York with his staff on the way to Boston and the same day Governor Tryon returned from England. Each was received with official ceremony, but Washington's reception as he passed up Broadway was an ovation. On April 4, 1776, New York was put under military rule by Gen. Israel Putnam, and batteries were installed along the East river and other strategic points. On the evacuation of

At the southern extremity is the fort; the building with the spire is the church and directly behind it is the general's house

Boston, Washington moved his headquarters to New York. The news of the Declaration of Independence came to New York on July 9, 1776, and was read to the soldiers who immediately thereafter tore down the equestrian statue of George III. in Bowling Green, an act denounced by Washington in the next day's general orders. On July 12, Admiral Howe appeared with his fleet in the harbour, but not until Aug. 22 were troops landed at Gravesend bay. On Aug. 27, the advance of British troops toward the American lines on Brooklyn Heights was begun and by 2 o'clock the same day, the heights were taken by the British. On the evening

of the 29th Washington withdrew all his troops from Long island without interference and reorganized in New York. The British then undertook to cut off the American army, on Sept. 15, by throwing a line of troops across Manhattan at about 34th street. But the Americans got to Harlem Heights, where Washington again reorganized. On Sept. 16, the British attacked unsuccessfully at Harlem Heights. About a week later, a fire broke out at Whitehall Slip and almost completely destroyed the lower part of the city. Trinity church was burned but St. Paul's and King's college were miraculously saved by a shifting of the wind. On this same evening, Nathan Hale, a spy for the American army, was captured on Long island and tried in New York by Gen. Howe. He admitted that he was a spy and was condemned and hanged at a spot near 45th street and First avenue. New York was held by the British troops for the remainder of the war. During British occupancy, it was used largely as a prison camp. Churches, warehouses, jails and stores were packed with men sick and well. On the site of the fire, a village of huts and tents had sprung up which was called "Canvas Town," and occupied by bandits and "roughs." Robberies were a daily occurrence and citizens could expect no relief from the British soldiers. In Wallabout bay, on the East river, an old hulk, the "Jersey," was used by the British as a prison ship and there over 11,000 men died. The city was in desperate straits for want of supplies, and sickness ravaged the people. There was no government except military rule, and the oppression of civilians by the soldiery was the cause of frequent riots. Justice was not to be had and the revenues of the city corporation were appropriated by the military for their private uses. After the surrender of Cornwallis at Yorktown, however, Sir Guy Carleton, a humane and honest officer, succeeded the intolerant Sir Henry Clinton in May 1782, and immediately undertook the restoration of law and order. By the time of the evacuation, Nov. 25, 1783, confidence in government was in a fair way to restoration.

The parting of Washington with his troops came on Dec. 4, 1783, at Fraunces' tavern. After the departure of Washington, James Duane was appointed mayor by Governor Clinton. Business slowly revived with freedom from restrictions of trade. King's college, by act of legislature, May 1, 1784, became the State university, and its name was changed to Columbia college. At this time, the population of the city was about 24,000. Congress made New York the capital in Dec. 1784; on April 30, Washington was inaugurated at Federal hall at the corner of Broad and Wall streets, and a day of celebration followed. There was still intense feeling against the loyalists, but commercial interests soon erased the memories of personal conflict. The rise of commerce and wealth drew many people to New York, and it began to take on the appearance of a metropolis. As capital, the city was continually gay with festivities, public and private. But on Aug. 12, 1790, Washington made his last official visit to Federal hall and went to the new capital, Philadelphia. Edmond Charles Genet, on his arrival with the secret purpose of embroiling America in a war with England, was received in New York at first with great enthusiasm, but with his recall, interest in French affairs grew cool. Men were too busy with their own affairs. Since 1786, the population had doubled and new streets and public utilities had been laid out. Collect pond, now the site of the Tombs (city prison), was the scene of the first trials of John Fitch's steamboat in 1796. New York ceased to be State capital in 1797. On July 11, 1804, the death of Alexander Hamilton in his duel with Aaron Burr threw the city into mourning and Burr was so execrated he left in the night of July 21. This year the New York Historical Society was founded. With the help of Mayor DeWitt Clinton and of several of the founders of the society, there was organized, in 1805, the Society for Establishing a Free School in the City of New York. Under Clinton schools were built and Columbia college improved, philanthropic organizations increased in number, and arts and letters were stimulated. In 1807 there were 19 newspapers, of which eight were dailies. Although the Embargo Act of that year struck New York trade a serious blow, it was not without benefit in stimulating home industry. Finally, the Non-intercourse Act relieved the situa-

tion somewhat. The City Hall was completed in 1812, and there was at this time a very considerable advance both in architecture and building construction. Many new buildings, chiefly churches, were built, new streets were graded, and swamps were filled in along the water front. Collect pond was filled in and the hills and valleys of lower Manhattan were rapidly leveled for homes and other structures. In the midst of this prosperity, war was declared against Great Britain. The toll exacted from New York was tremendous; the burning of Washington by the British resulted in a great concentration of troops in New York. New fortifications were thrown up along the water front and the old ones strengthened. But on Feb. 11, 1814, the ship "Favorite" arrived at New York under flag of truce with British and American messengers and the treaty of peace. A jubilee followed and Sunday was a day of fervent thanksgiving. New York was then transformed almost over night. DeWitt Clinton was again mayor, and under his guidance the services of government were everywhere improved. Cadwallader D. Colden succeeded Clinton and likewise advanced all governmental and private services for public welfare. Great numbers of immigrants from Europe arrived and the problems of dealing with this great mass of new residents taxed the city to its limits. Yellow fever broke out in 1819, 1822 and 1823, and hundreds died daily until the epidemics were checked with the coming of cold weather; others occurred ten years later with similar loss of life, but the city continued to grow with amazing rapidity. The opening of the Erie canal on Nov. 4, 1825, began a three days' celebration. At this date, the modern history of New York begins.

Under Mayor Philip Hone (1826) fine dwellings, public buildings and mercantile establishments multiplied; wealth increased and the continuing influx of immigrants made evident the need for greater educational opportunities. The University of the City of New York was established in a splendid new building opened in 1835. There were now over 200,000 people in the city, and transportation was a pressing problem, only partly solved by the horse-drawn street cars. Another great fire broke out below Wall street on Dec. 16, 1835, and the succeeding months were a period of great distress. Croton water was furnished the city on July 4, 1842. Blackwell's island, purchased in 1828 for \$50,000, was made the site of the city's correctional institutions and hospitals. The *New York Sun*, whose issue by Benjamin H. Day was begun in 1833, sold for a penny. The *Herald* of James Gordon Bennett appeared in 1835, the *Tribune* of Horace Greeley in 1841, Henry J. Raymond's *Times* in 1851. The theatre was thriving, business was rapidly spreading uptown, and Union square was the residential centre. Beyond Union square, there was little but open fields at the middle of the century. The World's Fair at the Crystal palace on Murray Hill was the outstanding event of 1853; in 1856 Central park was purchased. But in 1857 business was paralysed, thousands thrown out of work, and over 900 merchants failed; riots and disturbances of all kinds ensued. The same year, the State legislature laid the basis for the modern metropolitan police force, and a new régime of law and order was begun. The city recovered quickly from the depression of 1857, and at the outbreak of the Civil War was again thriving; it authorized a loan of \$1,000,000 for defence of the Union, and hundreds of thousands more were privately pledged. New York was again filled with soldiers. Rioting broke out in July 1863 as a protest against army drafts and for five days there was turmoil. More than 50 buildings were burned and several hundred people killed or wounded. Mayor Opdyke, in 1863, reported that the people of New York had contributed up to that time \$300,000,000 for war purposes, and had furnished over 80,000 men. During the war, the establishment of schools, scientific and literary associations, libraries, museums, and clubs went on apace, and at its end New York was still able to find resources for great public works. Brooklyn bridge was begun in 1870, and sanitary conditions, which in 1865 had been thoroughly studied by a citizens' committee and found deplorable, were on their way to betterment. New public improvements opened fresh opportunities for "graft" by public officials. Under the Tammany mayor, A. Oakey Hall, in 1872, a gigantic conspiracy for looting the city, known as the "Tweed

Ring," was exposed by the *New York Times* and a citizens' committee. The thefts of the "ring" ran into hundreds of millions, the "graft" in the erection of the county court-house alone amounting to about \$8,000,000. "Boss" Tweed and many of his followers were tried and sent to prison, and Tweed died there. Then followed a reform administration, but in 1874 Tammany regained control. The corporate limits of the city were extended in 1874 to include about 13,000 ac. across the Harlem river, in the Bronx, and in 1895, a still further extension in the same county was made which brought the city limits to the southern boundaries of Yonkers and Mount Vernon. In this same year, Col. George E. Waring, representing a reform administration under Mayor William L. Strong, was made commissioner of street cleaning and with his "white wings" inaugurated the modern system of street cleaning and refuse collection. The city was still further increased in 1898 by the annexation of Kings, Richmond, and a part of Queens, counties, and a new charter was enacted for the Greater New York. During all this period of administrative reconstruction, Tammany Hall continued the great political power, although occasionally defeated for the mayoralty. In 1897, Tammany again got control of the mayor's office by the election of R. A. Van Wyck, but was defeated in 1901, because of its abuse of power. Seth Low, a reform mayor, served during 1902 and 1903 when Tammany regained control. During the past 25 years Tammany has generally maintained its political power. Mayors George B. McClellan (1904-10) and William J. Gaynor (1910-14) were both elected by Tammany and both were able men and strove to give the city good government, even under the handicaps of the Tammany political system. In Mayor McClellan's administration, however, a citizens' civic agency, the New York Bureau of Municipal Research (organized in 1906), disclosed and published a report on irregularities in the administration of the office of Borough President Ahearn of Manhattan. Mayor McClellan appointed as a special counsel, John Purroy Mitchel, who secured sufficient evidence of these irregularities to warrant Governor Hughes in removing Borough President Ahearn for incompetency. In Mayor Gaynor's administration, a police lieutenant was arrested, tried and later found guilty of complicity with gangsters in the murder of a New York merchant, who was on the point of making disclosures of police corruption to the district attorney. Mayor Gaynor, wounded in an attempt upon his life, failed in health and died Sept. 10, 1913, almost at the end of his term. The police scandals of Gaynor's administration swung popular sympathy against Tammany, and John Purroy Mitchel, candidate for mayor on a "fusion" ticket, was elected and took office in 1914. In Sept. 1914, a special aldermanic committee of investigation undertook a complete survey of police administration and methods. The facts finally brought out by this committee furnished clear evidence of police incompetency and corruption. Mayor Mitchel's administration from 1914 to 1918 is now regarded as the most efficient in the last quarter century because of the administrative reforms which he instituted. Yet in the next election, he was defeated for re-election by an overwhelming vote, and John F. Hylan, another Tammany mayor, took office in 1918, on a platform of outspoken repudiation of the Mitchel administration. Mayor Hylan held office for two terms during which time there was continuous wrangling among the superior officers of administration to the extent that little of importance for the city's betterment was accomplished. One of the outstanding features of government in the period covered by the administrations of Gaynor, Mitchel and Hylan, was the enormous increase of budget from \$163,130,270.37 in 1910, to \$345,530,039.77 in 1921. In 1925, Mayor Hylan, denounced by many of his own Tammany supporters, was refused party support, and James J. Walker, a representative of the "new" Tammany, who had made a good record in the State senate, received the Democratic nomination. He was well supported by Governor Alfred E. Smith who was everywhere recognized as the actual leader of Tammany Hall, and, without much opposition from the Republican candidate Frank D. Waterman, Walker was elected with the endorsement of a great popular vote and the enthusiastic good will of a public tired of the constant wrangling of administrative officials

under his predecessor. The great issues of the Hylan administration were rapid transit and subway fares. The same issues have been paramount during the administration of Mayor Walker, but as yet no satisfactory solution has been reached. In other respects, Mayor Walker's administration has contributed materially to betterments in police, fire, health and hospital administration, and has undertaken many notable improvements in highways and traffic control.

NEW YORK CENTRAL LINES, an important system of railway, serving the northern and eastern portions of the United States. Its chief termini are New York, Boston, Chicago and St. Louis, and it serves also the cities of Detroit, Buffalo, Cleveland, Cincinnati, Montreal, Ottawa. The most important railroad of the system is the New York Central Railroad Company, a consolidated corporation formed of different companies operating railroads between New York and Chicago. The first railroad of this company was chartered in 1826 and opened for traffic in 1831. The company's important subsidiaries, controlled by stock ownership or by lease, are the Michigan Central Railroad Company; the Cleveland, Cincinnati, Chicago and St. Louis Railway Company, known as the Big Four; the Boston and Albany railroad; and the Pittsburgh and Lake Erie Railroad Company. The mileage of the system is 11,847 m. of road and 28,078 m. of track. A large percentage of the trackage is protected by automatic signals, and by automatic train control. The system is the owner of 5,867 locomotives, 282,119 freight cars and 5,143 passenger and other cars. The total funded debt, as of Dec. 31, 1927, of the system was \$930,487,904 and of the New York Central Railroad Company, \$684,629,139. The gross amount of capital stock of the system was

\$562,600,000, of which the New York Central had outstanding, \$421,285,000. The lines transport over 238,000,000 tons of freight per year, of which 44% is coal, 26% manufactured articles and the remainder general traffic, such as products of agriculture, animals and products, etc. It is over the line of the New York Central that the train known as the 20th Century Limited is operated between New York and Chicago. General offices of the system are in New York city. (C. C. PAU.)

NEW YORK, CHICAGO AND ST. LOUIS RAILROAD, popularly known as the Nickel Plate Road, operated, in 1928, 1,695 m. of railway between Buffalo and the mid-western gateways of Chicago, Peoria and St. Louis. The track was originally planned as a line between St. Louis and Ft. Wayne, Ind. Its promoters changed their plans and determined on a route between Chicago and Buffalo. The first construction was between Arcadia, O., and McComb, O., in 1881. The first train was operated over the line on Oct. 22, 1882.

The New York Central controlled the road for many years. In 1916 control was acquired by the Messrs. O. P. and M. J. Van Sweringen, who, after largely rebuilding the property, consolidated it with the Lake Erie and Western and the Toledo, St. Louis and Western (Clover Leaf). Through this consolidation, the mileage was more than tripled, and the road's strategic position was enhanced as a result of additional gateways reached by its rails. Total revenue freight ranges yearly from 22 to about 25 million tons. The capital structure, on June 30, 1928, included 337,061 shares (par \$100) of common and 360,355 shares (par \$100) of preferred stock outstanding. Operating revenues, since the consolidation, have ranged approximately from \$54,000,000 to \$57,000,000 annually, with net income ranging approximately from \$6,000,000 to \$8,000,000 a year. (W. L. RO.)

NEW YORK FERN (*Dryopteris noveboracensis* or *Thelypteris noveboracensis*), a beautiful North American fern of the shield-fern group. While named after New York, it is native to a much greater region, occurring in moist woods from Newfoundland to Minnesota and southward to Virginia, Georgia and Arkansas. The delicate fronds, 1 to 2 ft. high, rise on slender stalks (stipes) from widely creeping rootstocks. (See SHIELD-FERN.)

NEW YORK, NEW HAVEN AND HARTFORD RAILROAD COMPANY, THE, is a comprehensive transportation system serving Southern New England and New York with rail, highway and water transportation. It operates 2,168 m. of railroad, the network of lines being the result of consolidation and merger of 137 separate rail lines. The New England Transportation Company, a subsidiary, operates 267 motor coaches over more than 2,200 m. of highway. Steamships are operated through two subsidiary companies, The New England Steamship Company and The Hartford and New York Transportation Company. Through The Connecticut Company, the Berkshire Street Railway Company, and The New York and Stamford Railway Company, the "New Haven" is also engaged in street car and bus transportation.

The territory served comprises the most densely populated territory in the United States. The four States in which it operates, Rhode Island, Massachusetts, Connecticut and New York, rank respectively first, second, third and fifth in density of population per mile of railroad. The New Haven was the first steam railroad in the country to adopt electrification, and in 1928 its four-tracked line between New York and New Haven, a distance of approximately 72 miles, was entirely electrified. The capitalization of the parent company as of Dec. 31, 1927, was \$217,253,997. (E. J. PE.)

NEW YORK STATE BARGE CANAL SYSTEM consists of the Erie canal, the Champlain canal, the Oswego canal, the Cayuga-Seneca canal, Black river canal, Cayuga Lake Inlet at Ithaca, the Glens Falls Feeder and the lakes, reservoirs, feeders, harbour basins and terminal docks facilities. The total length of the system is about 575 miles. The Shinnecock-Peconic canal, located in the county of Suffolk on Long Island, connecting the waters of Shinnecock and Peconic bays is also officially a part of the canal system.

The total number of locks on the main channels of the

improved canals, exclusive of the U.S. Government lock at Troy, is 56. There are 34 locks on the Erie, 11 on the Champlain, 7 on the Oswego canal and 4 on the Cayuga and Seneca canal. In addition, there are two junction locks and two guard locks.

Navigation is free and the usual navigation season is seven months from May 1 to Dec. 1. The canals are available for use 24 hours of the day. Boats about 300 ft. long, 42 ft. wide, with a draft of 10 ft. and a cargo capacity of 2,800 tons are generally used.

The Erie Barge canal is the main waterway, connecting the Hudson river at Albany and Troy with Lake Erie at Buffalo. It has a total length of 340 m. and serves as the main route of transporting grain from the west to New York. It is 150 ft. wide and 12 ft. in depth. The cost of construction and improvement was \$139,214,929.

The Cayuga and Seneca canal connects Montezuma, N.Y., with the Cayuga and Seneca lakes and affords communication between these lakes and the Erie canal. Including the lakes the length of the canal is 92 m.; exclusive of the lakes, it is approximately 24 miles. It is 200 ft. wide and 12 ft. in depth. The cost of construction was about \$8,154,000.

The Black river canal connects Black river and the Erie canal and affords communication between Rome, N.Y., and Lyon Falls, N.Y. Elevation is gained by four locks. It is 35 m. long, 42 ft. wide, 4 ft. in depth. The cost of construction with improvements was \$3,481,954.

The Champlain canal connects Whitehall, N.Y., at the head of Lake Champlain with the Erie canal at Waterford, providing a waterway between the Atlantic seaboard and the navigable St. Lawrence. It is 60 m. long, 125 ft. wide and 12 ft. in depth. The cost of construction was about \$21,691,000.

The Oswego canal connects Lake Ontario at Oswego with the Erie canal at Syracuse and provides communication between Syracuse and Oswego, and by the use of the Welland canal, with the other Great Lakes. The cost of construction and improvement was about \$12,000,000.

NEW ZEALAND, a British dominion (1907), consisting of a group of islands lying in the south Pacific between 34° 25' and 47° 17' S., and between 166° 26' and 178° 36' E. The group is situated eastward of Tasmania and Victoria, and Wellington, its capital and central seaport, is 1,204 m. distant from Sydney. Of certain outlying clusters of small islands included in the dominion group proper (and for statistical purposes), the Chathams (356 m. E. of Cook strait), Auckland and Campbell island are alone of any value. The Chathams are chiefly inhabited by sheep-farming colonists. The Auckland contains two of the finest harbours in the Pacific. Six hundred miles north of the Auckland, the volcanic Kermadec, covering 8,208 ac., are picturesquely clothed with vegetation. In Polynesia a number of inhabited islands were brought under New Zealand control by proclamation in 1901. Rarotonga and Mangaia, in the Cook group, and Niue or Savage island are the largest of these; Penrhyn and Suvarrow, though but small coral atolls, contain excellent harbours. Rarotonga is hilly, well watered, and very beautiful. By mandate of the League of Nations, New Zealand also administers the former German possession of Western Samoa, and has joint control in the phosphate island of Nauru. In 1923, at the desire of the British Government she became responsible for the administration of the Ross sea, and in 1926 of the Tokelau, or Union group. Apart from these dependencies New Zealand has an area of 103,285 sq.m., of which its two important islands, called North and South, contain 44,131 and 58,120 respectively, while, divided from South island by Foveaux strait, Rakiura or Stewart island, mountainous and forest-clad, contains 662 sq.m. These three form a broken chain, North and South islands being cut asunder by Cook strait, a channel varying in width from 16 to 90 miles.

North island is 515 m. long and varies in breadth from 6 to 200 miles. It is almost cleft in twain where the Hauraki gulf penetrates to within 6 m. of Manukau harbour. From the isthmus thus formed a narrow, very irregular peninsula reaches out northward for some 200 m., moist and semi-tropical, and beautiful rather than uniformly fertile.

South of the isthmus aforesaid, the North island rapidly broadens out. Its central physical feature is the series of unbroken mountain chains running north-east from Cook strait to East cape on the Bay of Plenty, ranges seldom under 3,000 ft., but never attaining 6,000 ft. in height. Ikurangi, their highest summit, though a fine mass, does not compare with the isolated volcanic cones which, rising west of the main mountain system and quite detached from it, are among the most striking sights in the island. Ruapehu (9,175 ft.) is intermittently active and Ngauruhoe (7,515 ft.) emits vapour and steam incessantly. Egmont (8,260 ft.) is quiescent; its symmetrical form and dense clothing of forest make it the most beautiful of the three. North of the two first-mentioned volcanoes Lake Taupo spreads over 238 sq.m. in the centre of a pumice-covered plateau from 1,000 to 2,000 ft. above the sea; and round and beyond the great lake the region of the thermal springs covers 5,000 sq.m. and stretches from Mount Ruapehu to White island, an ever-active volcanic cone in the Bay of Plenty. The most uncommon natural feature of the district, the Pink and White terraces, was blown up in the eruption of Mt. Tarawera in 1886, when for great distances the country was buried beneath mud and dust, and a chasm 9 m. long was opened. Fine lakes and waterfalls, innumerable pools, in temperature from boiling-point to cold, geysers, solfataras, fumaroles and mud volcanoes still attract tourists in large numbers. The healing virtue of many of the springs is widely known. The Government maintains a sanatorium at Rotorua and Te Aroha, and there are private bathing establishments in other places, notably near Lake Taupo. In South island there are hot pools and a State sanatorium at Hanmer Plains. The most remarkable cures effected by the hot waters are in cases of gout, rheumatism, diseases of the larynx and in skin disorders. Though the overlying porous pumice reduces the fertility of the Taupo plateau, except under treatment, it has a good rainfall and is drained by unfailing rivers running through deep terraced ravines. The Waikato and Waikou flow north, the Rangitiki north-east, and Mokau, Wanganui, Rangitikei, and Manawatu west or south-west. The first named, the longest river in the colony, though obstructed by a bar like all western—and most eastern—New Zealand rivers, is navigable for some 70 miles. The Mokau and Wanganui run between ferny and forest-clad hills and precipices, often of almost incomparable beauty.

East of the Taupo plateau and south of Opotiki on the Bay of Plenty are steep thickly-timbered ranges. On the southern frontier of this mountainous tract Waikaré Moana extends its arms, the deepest and most beautiful of the larger lakes of the island.

From the mouth of the Waikato southward to about 25 m. from Cape Terawhiti on Cook strait, and for a distance of from 20 to 40 m. inland, the western coast skirts fertile grazing and dairy-farming country. On the east coast the same fertility is seen and, round Hawkes bay, a hotter and drier summer. In the south centre, the upland plain of the Wairarapa has a climate adapted for both grazing and cereals. The butt-end of the island, of rather poor, rough, though well-grassed wind-beaten hills, is redeemed by the fine harbour of Port Nicholson, which vies with the Waitemata in utility to New Zealand commerce. Everywhere the settler may count on a sufficient rainfall, and—except on the plateau and the mountain highlands—mild winters and genial summers. To pass Cook strait and land in the middle province of South island is to pass from Portugal to Switzerland, a Switzerland, however, which has long fertile plains extending to the coast and giving the highest yield of cereals in New Zealand. As a rule the shores of South island are high and bold enough. They are not too well served with harbours, except along Cook strait, in Banks peninsula, and by the grand but commercially useless fjords of the south-west. In the last-named region some 15 salt-water gulfs penetrate into the very heart of the mountains, winding amid steep, cloud-capped ranges, and tall, richly-clothed cliffs overhanging their calm waters. The dominating features of south New Zealand are not ferny plateaux or volcanic cones, but stern chains of mountains. There the Southern alps rise range upon range, filling the whole centre,

almost or quite touching the western shore, and stretching from end to end of the island. West of the dividing crest they are forest clad; east thereof their stony grimness is but slightly softened by growths of scrub and tussock grass. The rivers are many, even on the drier eastern coast. But, as must be expected in an island but 180 m. across at the widest point and yet showing ridges capped with perpetual snows, the rivers, large or small, are mountain torrents, now swollen floods, anon half dry. The largest river, the Clutha, though but 80 m. long in its course to the south-east coast, discharges a volume of water estimated at nearly 2,000,000 cu.ft. a minute. On the west the only two rivers of importance are the Buller and the Grey, the former justly famous for the grandeur of its gorges. Te Anau and Wakatipu (54 m. long) are the chief lakes in the South though Manapouri is the most romantic. Mt. Cook is easily first among the mountain peaks. Its height, 12,349 ft., is especially impressive when viewed from the sea off the west coast. On the north-east a double range, the Kaikouras, scarcely fall short of the Southern alps in height and beauty. Apart from the fjords and lakes the chief beauties of the Alps are glaciers and waterfalls. The Tasman glacier is 18 m. long and has an average width of $1\frac{1}{2}$ m.; the Murchison glacier is 10 m. in length. To the west of Mt. Cook the Franz Joseph glacier crawls into the forest as low as 400 ft. above sea-level. Among waterfalls the Sutherland is 1,904 ft. high, but has less volume than the Bowen and others. The finest mountain gorge, the Oira, is also the chief railway route from the east to the west coast. Generally the open and readily available region of South island extends from the Kaikouras along the east and south-east coast to the river Waiau in Southland. It has a mean breadth of some 30 miles. In compensation the coal and gold, which form the chief mineral wealth, are found in the broken and less practicable west and centre.

Climate.—New Zealand, stretching through over 11° of latitude, would present more contrasts of climate were it not for the fact that oceanic influences penetrate everywhere. Most of it is in or near the northern border of the westerlies with their cyclones though the north end feels the trade winds in summer. The only really large mass of high land is in the southern half of South island and even here maritime influences prevent winter cold from lasting continuously for long.

The following table resumes some important data:—

	Jan. Mean t°	July Mean t°	Total rainfall	
Auckland . . .	66.3	51.7	43.8	Greater in winter
Rotorua . . .	63.7	45.7	53.8	" " "
Napier . . .	66.1	49.0	32.3	" " "
Wellington . .	62.5	47.7	48.1	" " "
Nelson . . .	64.5	46.1	37.6	" " "
Hokitika . . .	60.2	44.9	116.5	Spring often wettest
Lincoln, near Christchurch .	61.6	43.1	25.3	Generally distributed
Dunedin . . .	57.9	42.3	36.8	" "
Queenstown, on Lake Wakatipu	60.1	37.5	30.4	Spring often wettest
Invercargill . .	56.9	41.4	40.5	" " "

The range of mean temperatures is small, the rainfall moderate save on the west slopes of the Southern alps. (See Hokitika above.) The snowline reaches down to 3,000 ft. on the eastern side of the Southern alps which has rather lower temperatures than other parts (see Queenstown above) but on the western side it is at 3,700 feet. Nelson, sheltered from the west, is famed for its sunny climate with cool bracing nights.

The winter maximum of rainfall in the north follows naturally from the régime of the winds, the all-the-year round distribution of the light rainfall on the east side of South island contrasts with the tendency to a spring maximum on the western and southern fringes of the Southern alps. The heavy rainfall on the west has permitted glaciers to exist and to reach down into the lowlands in some places in spite of the general mildness. The mountainous Stewart island has 65.2 in. of rainfall. The mildness and rainfall permit widespread evergreen vegetation and the

healthiness of the islands is attested by the death rate of 8.74 per 1,000 in 1926, the lowest death rate known.

Flora.—There are about 1,000 species of flowering plants, of which about three-fourths are endemic. Most of those not peculiar to the country are Australian; others are South American, European, Antarctic; and some have Polynesian affinities. Ferns and other cryptogamic plants are in great variety and abundance. The New Zealand flora, like the fauna, has been cited in support of the theory of the remote continental period. In appearance the more conspicuous flora differs very greatly from that of Australia, Polynesia, and temperate South America, and helps to give to the scenery a character of its own.

The early colonists found quite half the surface of the archipelago covered with dense, evergreen forest, a luxuriant growth of pines and beeches, tangled and intertwined with palms, ferns of all sizes, wild vines and other parasites, and a rank, bushy, mossed undergrowth. Though much of the timber is of commercial value—notably the kauri, totara, puriri, rimu, matai and kahikatea—this has not saved the forests from wholesale, often reckless, destruction for settlement purposes. In late years active operations by the State, private companies and the settlers themselves, in re-forestation with European, Californian and Australian soft woods are doing much to restore the earlier ravages. These improvements are mainly in the naturally open and grassy regions of the east and south-east.

Fauna.—In their natural state the islands had no land mammals. The Polynesians brought a dog, now extinct, and a black rat, now rarely seen. The wild dogs and pigs in outlying districts are descendants of domestic animals which have escaped into the bush. There are no snakes. There are bats, one belonging to a peculiar genus and one related to Australian and South African forms. New Zealand was very rich in birds, the tui and makomako being famed as songsters, while the flightless and weak-winged birds were numerous; the kiwi (*Apteryx*), kakapo (*Strigops*), takahe (*Notornis*) cannot fly. The last named is very rare and has not been seen since 1898. New Zealand formerly possessed the gigantic running bird called the moa (*Dinornis*), a huge rail (*Aptornis*) and other bird types now extinct. The earlier destruction of the forests had disastrous effects on bird-life. In the Alps a hawk-like green parrot, the reo, which has been known to kill sheep, holds its ground. The pukeko, a handsome rail, abounds in swamps.

Bush and grass fires, cats, stoats and weasels, introduced in the 19th century, have reduced the bird population; and deer, pheasants, trout and salmon have been introduced by sportsmen. The most famous New Zealand animal, scientifically, is the Tuatara, the sole survivor of the reptilian order of the Rhynchocephalia, otherwise extinct since Mesozoic times so far as is known. The butterflies are few and moths numerous; there is a native beach-spider (*Katipo*) now extinct. An organism named *Peripatus* has a New Zealand species; it is intermediate in structure between the earthworms and the myriapods and species occur in various isolated regions, mostly in southern lands.

Resolution, Kapiti and little Barrier islets have been set aside as sanctuaries for the native fauna.

Tidal waters furnish minute whitebait, and the mud-flats of salt or brackish lagoons and estuaries flounders. Oysters, both mud and rock, are good and plentiful. Sharks are found everywhere, and are common around the north; they rarely attack man. The albatross is the most conspicuous sea-bird. Penguins are found, confined to the islets of the far south. (H. J. B. D.)

GEOLOGY

New Zealand is part of the Australasian festoon on the Pacific edge of the Australasian arc. Owing to its critical position it has had a particularly varied geological history, and includes, for its size, an unusually complete series of marine sedimentary rocks. It is still a matter of doubt whether pre-Cambrian rocks constitute any portion of the islands. The oldest rocks, however, extend at intervals down the western side of the South island. They include a complex of gneisses, schists and dioritic igneous rocks in Fiordland, and sillimanite gneisses on Stewart island.

Main Divisions.—The first evidence of life appears in rocks of Lower Ordovician age, forming a folded belt in the south at Preservation Inlet and in the extreme north-west at Collingwood. They comprise graptolitic slates, quartzites and marbles, and are characterized by an Arenig fauna including *Tetraraptus*, *Bryograptus*, *Dichograptus* and *Didymograptus*. According to the Geological Survey the metamorphic rocks already referred to form a Pre-Ordovician series below these fossiliferous sediments, but it is to be noted that no clear line of separation between the two series has yet been discovered. An alternative view regards the Ordovician rocks as passing gradually into mica schists, which are invaded, as in Fiordland, by gneissic diorites. The strike of these ancient rocks ranges from west-north-west to north-north-east, but is not very different from the associated Ordovician sediments.

Between the Ordovician sediments and the succeeding Silurian series a strong unconformity is probable. The latter are known only in the north-west of the South island, on the Baton river and at Reefton. The rocks include argillaceous limestones and shales on the Baton river, and a littoral facies of quartzite, greywacke and limestone at Reefton, both with a Wenlock fauna.

Nothing is known of the geological history of New Zealand between the Upper Silurian and the close of the Palaeozoic period, from which time the stratigraphic record in the islands is particularly complete. Much of the highlands are built up of folded greywackes, slates and some limestone, with a volcanic horizon recognized near the base of this folded series. The whole is divided into a Permian (Maitai) series and a Mesozoic (Hokonui) series. The nature of the junction between the two is still little understood, various authorities claiming a complete conformity, much regression, or marked diastrophism with plutonic (dioritic) intrusions.

In the type locality (Nelson district) the Maitai series (limestones, shales and slates) contain *Platyschisma*, *Strophalosia*, *Martiniopsis* and *Spirifer bisulcata*, a fauna characteristic of the Permian beds of eastern Australia. An extensive series of basic breccias (Te Anau series) forms the base of the Maitai series and upon which the fossiliferous sediments rest. The top of the series is formed of greywackes, in places containing annelid tubes (*Terebellina*). These are referred to a Lower Triassic age. This Permian series has a wide distribution in the South island. The succeeding events are not clear. Probably there followed a regression of the sea, succeeded in turn by a transgression when the Hokonui beds were laid down. The base of this series is of Middle Triassic age, these beds being followed by Upper Trias. They include the Carnic, Noric and Rhaetic stages, the sediments being greywackes, limestones, an horizon of basic tuffs (Noric) and Rhaetic plant beds. The sequence or portions of it are recognized from both the South and North islands.

The Noric beds, characterized by an abundance of *Pseudomontis*, have a very wide distribution, extending throughout the Southern Alps in Canterbury, along the Hokonui hills, in the Nelson district, and in the Mokau district of North Taranaki. The series extending from the Middle Trias to the Rhaetic is of great thickness, of the order of 10,000 feet. These beds are followed conformably by Jurassic felspathic sandstones, conglomerates, plant beds and some thin coal seams. Liassic, Bajocian and also Upper Jurassic marine faunas have been described. A widespread series of sediments containing *Inoceramus* occurs in the east of the North island, probably, in part, of Upper Jurassic age, but extending into the Lower Cretaceous. The problematical schists of the South island, well developed in the Otago region, and referred to as the Otago schists, are perhaps of Mesozoic age, though they have been referred to horizons from the Archæan to the Jurassic. They appear to pass outwards into sediments indistinguishable from Ordovician or Mesozoic strata.

At the close of this sedimentation, in Lower Cretaceous times, a strong orogenic movement supervened, in which the Hokonui system was folded along meridional lines, the earth movements being accompanied by widespread plutonic intrusions throughout the length of New Zealand. The dunite sills of the Dun mountain region, and the gabbros and norites of North Cape belong to this

epoch, as perhaps do also some of the diorites of the south-western district of the South island. The intensest folding in the North island is developed in the east; in the west the flexures become more open and undulating strata predominate. In the Otago region, the Otago schists have recently been interpreted as a flat lying series forming a packet of recumbent folds, the participating rocks being referred to members of the Maitai and Hokonui series.

Sequence of Formations.—Following the Hokonui diastrophism a series of sediments ranging from Middle Cretaceous to Upper Pliocene was deposited, but the record has received diverse interpretations, particularly in regard to the structural relations of the beds and the correlation of formations in neighbouring regions. According to the view of Marshall, the whole series is conformable throughout, a difference in age of the basal strata in different districts being ascribed to overlap over an irregular surface of the older rocks. Summarily, the sequence of formations is as follows:

Middle Cretaceous (Albian)	Marine beds (in Kaikoura ranges)
Upper Cretaceous { Senonian	Greensands, basal coal measures
Danian	Limestones (partly foraminiferal)
Eocene	Marine beds and coal measures
Oligocene	Marine beds
Miocene	
Pliocene	Marine beds and gravels

The oldest rocks of this sequence are developed in the Karikou mountains of Marlborough, where a thickness of from 3,000 to 9,000 ft. of sandstones and mudstones, with conglomerates and some coal measures were deposited. These Albian beds are followed by the Amuri limestones (2,500 ft.), but in Canterbury and the coast of Marlborough Senonian strata underlie the limestone series. In the succeeding Eocene period the coal measures of the south-western district of the South island were formed and constitute the most valuable coal seams of New Zealand. The transgressions of Oligocene and Miocene times submerged much of both South and North islands, but in the central region of Otago the land remained emergent. Fluvial and lacustrine deposits, however, covered large parts of this area. They are frequently auriferous. A general retreat of the sea from the South island took place in Pliocene times, but the North island remained largely below sea-level. In the Wanganui area a wonderful development of clays, 3,500 ft. thick, was deposited, apparently without break. The present topography of New Zealand developed as a result of important crust warpings and block faulting. The faults are not simple tensional movements, but involved strong lateral pressure, in which overthrusting and overfolding are developed. The isoclinally folded Tertiary rocks of the Lake Wakatipu region show particularly well the extreme effects of this movement. The earliest development of vulcanicity after the Post-Hokonui orogeny is seen in the Middle Cretaceous basalts of the Clarence region and the Upper Cretaceous rhyolites near Christchurch. Vulcanicity became more widespread in Mid-Tertiary times. To this period belong the pillow lavas and tuffs of the Oamaru district and the rhyolites, andesites and dacites of the Coromandel peninsula. Propylitization of these andesitic rocks gave rise to the auriferous deposits of this latter area. Somewhat later came the alkaline eruptions of the Dunedin district and the basalts forming Banks peninsula. The alkaline rocks of the former area include a varied succession of alkaline trachytes, phonolites, trachydolerites and basalts.

Volcanic activity of Upper Tertiary time extending to the present day led to extensive eruptions of andesites and rhyolites in the North island. Mt. Egmont consists largely of andesite. The main centres of activity lie on a north-east line of crustal weakness extending from Ruapehu to Mt. Edgecumbe, and the great rift of the Tarawera eruption extending to Lake Rotomahana has a similar trend. In the Pleistocene, the present system of glaciers had a great extension, and they undoubtedly reached sea-level in the south-west of the South island. On the east they appear to have been confined to the mountain valleys.

Study of the fossil fauna and flora of the New Zealand region

points from many lines of evidence to intimate connection, in Mesozoic times, between this land, Australia and Malaysia. In the later Cretaceous period the connection between Australia and New Zealand was severed, though the latter was directly associated with Antarctica. In the Upper Cretaceous only one species of mollusc (*Natica variabilis*) is known to be common to Australia and New Zealand. The complete isolation of the New Zealand region seems to have been accomplished by Middle Tertiary time, by a gradual break up of the circum-Pacific connections.

BIBLIOGRAPHY.—Information on the geology of New Zealand is principally contained in the *Bulletin* of the Geological Survey of New Zealand, and in the *Transactions* of the New Zealand Institute. Reference should also be made to extended accounts given by J. Park, *The Geology of New Zealand* (1910); P. Marshall, "New Zealand and the Adjacent Islands," in Steinmann's *Handbuch der regionalen Geologie*, Bd. vii., abt. 1 (1912); P. G. Morgan, "Geology of New Zealand," *Official Year Book* (1914) and particularly W. N. Benson, "Recent Advances in New Zealand Geology," Presidential Address Section C. Australasian Association for Advancement of Science (1921), where a detailed summary and bibliography is presented. (C. E. T.)

POPULATION AND LAND SETTLEMENT

Population.—In Jan. 1840 there may have been 2,000 whites in New Zealand. By 1861 the number was still slightly under 100,000. During the next 20 years the gold discoveries, the public works expenditure, and the development of agriculture, multiplied the number of colonists five times to 498,000 in April 1881. Then increase slackened for many years, and was slowest between 1886 and 1891, when the addition was but 48,000 in five years. In 1901 the whites numbered 773,000; and between that year and the census computation in April 1906 the increase, 115,859. In 1911 the white people had increased to 1,008,468, and in 1916 to 1,099,449. The census figures for 1916, 1921, 1926 and the estimated population at June 30, 1928, were as follows:—

	1916	1921	1926	1928
Europeans	1,009,449	1,218,013	1,344,384	1,380,076
Maoris	49,776	52,751	63,670*	65,004*

*Prior to the census of 1926 half-castes living as Europeans were counted as Europeans. (All half-castes are now classed with Maoris.)

The gain in population in the two last census periods was:—from 1916–21, 119,464 or 10.87%, and from 1921 to 1926, 129,792 or 10.69% (the last figure, of course, excludes half-castes). The average annual increment of population is less than 2½%. The number of males in 1926 was 686,384, and females 658,085. The number of females to 1,000 males has risen from 622 in 1861 to 959 in 1926.

In 1916 the birth rate per 1,000 was 25.94 and in 1926, 21.05. In the same periods the death rates per 1,000 were 9.64 and 8.74 respectively. The population is chiefly centred in the North island and the drift that way, largely due to the development of the dairy industry, is growing. In 1926, 61.87% of the people resided in the North island. The Maoris, who are not included in this percentage reside chiefly in the North island. The census statistics of 1926 classed 51.62% of the population as urban. The total population of North island in 1926 was 831,738; the total population of South island (including Stewart island and Chatham islands) was 512,636. Of the entire population, 559,068 lived in the rural districts and 785,316 in boroughs.

In 1921, 98.43% of the inhabitants (exclusive of Maoris) had been born in the British empire. Of the total in 1921, 74.39% were born in New Zealand, 19.54% in the United Kingdom, and 3.94% in Australia. A certain number of those born in foreign countries were of British parentage or nationality, and including these the proportion owning British nationality, in 1926, was 99.35%.

The number of aliens steadily diminished—from 12,050 in 1911 to 7,901 in 1921. Certain restrictions are placed upon the entry into the dominion of "race aliens," a classification implying persons of other than Europeans. Of the total population in 1925, 43.66% were members of the Church of England, 25.42%

Presbyterian, 13.93% Roman Catholics, and 9.53% Methodists.

The Maori race increased from 49,844 in 1911 to 54,768 in 1925. The census of 1926 and subsequent estimates, already given, include half-castes, and for that reason show a greater increase. There are 130 native schools with an average daily attendance of 5,947 scholars.

Immigration.—In normal times the immigration policy of New Zealand has been to provide assistance, by free or reduced

passage rates, to desirable immigrants from Great Britain. About June 1927, however, the policy was suspended (except in the case of domestic servants and a few parties of youths to undertake farming) owing to unemployment in the dominion. The date of the resumption of the policy is uncertain. Under the New Zealand scheme assistance was restricted, except in the case of domestic servants, to persons nominated by permanent residents of the dominion, provided such persons were healthy and under 50 years of age. The nominator must undertake to make provision for the maintenance and employment of the nominee, and guarantee that residence shall extend to at least five years. The quota of such assisted new arrivals is fixed from

BY COURTESY OF CANADIAN PACIFIC S. S. CO.
A MAORI WARRIOR BESIDE A TOTEM POLE

period to period. From shortly after the World War of 1914–18 until 1925 the quota was 10,000 per annum, but early in 1926 it was extended to 13,500. A large section of the sheep owners of the dominion also have a fund of over £200,000, allocated out of wool profits of the period 1914–18, for training sons and daughters of sailors of the navy and mercantile marine who were killed or incapacitated during the World War, the lads in farming at a special institution in New Zealand, and the girls in domestic and light farming work at another. Free passages are provided by the Government of New Zealand, and the children are provided with suitable employment after training. Both schemes are under the scrutiny of the minister for immigration and both have operated with entire success and satisfaction. The British Government co-operates with the dominion in its assisted migration and provides a share of the passage money.

The following table shows the number of assisted immigrants entering the Dominion of New Zealand for each year of the 16-year period, 1911–1926 inclusive, immediately preceding the suspension of the policy of governmental aid:—

Year	Number	Year	Number
1911 . . .	3,070	1910 . . .	3,560
1912 . . .	3,535	1920 . . .	7,015
1913 . . .	5,151	1921 . . .	8,085
1914 . . .	3,716	1922 . . .	7,773
1915 . . .	1,300	1923 . . .	6,181
1916 . . .	695	1924 . . .	8,091
1917 . . .	231	1925 . . .	8,230
1918 . . .	421	1926 . . .	10,760

Land Settlement.—The total area of the dominion is 66,390,262 ac., and the following is the condition of the land in 1927:—

	Acres
Held on freehold	21,214,818
Reserved for public purposes	14,597,746
Crown lands leased	18,175,179
Crown lands yet available for disposal	2,721,488
Lands held by the native race	5,798,093
Unfit for settlement (including rivers, lakes, roads, etc.)	3,882,938
	66,390,262

Of the 43,587,698 ac. of occupied land in 1927, 18,830,436 ac. were in cultivation as follows:—

	Acres
Grain and pulse	671,804
Grasses and clover (for hay and seed) and green and root crops	1,098,058
Fallow	124,003
Grasses and clover (permanent pasture)	16,680,348
Vineyards and orchards	25,686
Market gardens, etc.	5,566
Private gardens and grounds	64,783
Plantations	160,188
	18,830,436
Unimproved land	24,757,262
	43,587,698

The unimproved land was divided up into 69,420 ac., under flax; 14,197,853 ac. of tussock and native grasses; 4,123,743 ac. of fern, scrub, etc.; 4,009,032 ac. of standing virgin bush; and 2,267,214 ac. of barren land. The Wellington and Auckland provinces possess the greatest flax areas, and Canterbury and Otago the tussock land (used for sheep grazing); the fern and scrub areas are well distributed; Westland and the Auckland provinces contain the chief forest lands; the barren lands mainly consist of the mountain areas of South island. The remaining Crown lands are being thrown open as rapidly as possible. In the 1924-25 financial year 456,590 ac. were selected under the various tenures provided by the Land Act, 1924, Land for Settlements Act, 1908, and Education Reserves Amendment Act, 1910. There is legislative provision for the prevention of aggregation in large areas and for sub-division if desirable.

The advances to Settlers Act, 1894, was embodied in the State Advances Act, 1913, under which money is lent to settlers on first mortgage of lands and improvements held under certain specified classes of tenure. The Government has authority under the act to borrow money for these advances. The scheme has proved very successful and from 1917-21 repayments exceeded advances. In 1923 its application was widened to enable larger amounts to be borrowed and increased advances to be made; as a result the loans authorized in the two succeeding years were greatly increased. In 1926-27, 1,853 loans amounting to a total of £1,980,795 were authorized.

(1924); G. H. Scholefield, *Who's Who in New Zealand* (1924).

ADMINISTRATION AND FINANCE

Political Organization.—New Zealand was not colonized in the ordinary manner around one centre. There were in its early years six distinct settlements—Auckland, Wellington, Nelson, New Plymouth, Canterbury and Otago—between which communication was for several years irregular and infrequent. To meet their political needs the Constitution Act of 1852 created them into provinces, with elective councils and superintendents respectively, subordinated to one colonial legislature. In 1876 the provincial system was abolished. The General Assembly, as it is called, is composed of the governor-general, the legislative council, and the House of Representatives. The governor-general is appointed by the Crown and is assisted by an executive council of 11 members in addition to himself. The Legislative Council consists of members appointed for seven years by the governor-general in council. The number on the roll (1928) is 38. The House of Representatives consists of 80 members elected by universal suffrage, 76 Europeans and four Maoris. Members of both houses are paid. An elector must have resided for one year in the dominion and for three months in the electoral district in which he claims to vote. A system of compulsory registration of electors was introduced at the end of 1924. The duration of the house is for three years. Executive administration is conducted on the principle of the English parliamentary system. The Government is represented in England by a high commis-

sioner. Since 1907 the colony has been known officially as "The Dominion of New Zealand," and in 1917 the designation of "governor and commander-in-chief" was altered to "governor-general and commander-in-chief."

Local administration is vested in local elective bodies with power to levy rates. The Counties and Municipal Corporations Acts of 1876 reorganized the local administration after the abandonment of the "provincial" system. (H. J. F.)

Education.—Under the Education Act of 1877 State education in New Zealand is free, secular and compulsory, between the ages of seven and 14. In 1914 the whole of the law relating not only to primary, but to secondary, technical, and special schools was recast. By an act of 1915 nine education districts were created from the existing 16. A council of education was also constituted to report to the minister and advise on any matters referred to it. By the Education Amendment Act, 1921-22, the registration of all private schools was made compulsory, and teachers in all schools were required to take the oath of allegiance. The number of scholars in all educational institutions in 1911 was 194,325, and in 1926, 297,751. The following table shows the advance in the State primary schools (including district high schools):—

Year	No. of schools	Pupils at end of year	Average attendances %
1913	2,255	172,168	89.2
1918	2,365	104,034	88.7
1926	2,601	219,069	89.9

The number of teachers in public schools in 1913 was 4,262; and in 1926, 6,183. In 1915 there were 11,958 children receiving secondary and technical instruction at all classes of schools; in 1926 there were 27,110. Free places at secondary schools are granted to suitably qualified pupils. There are also national scholarships. Control of higher education is vested in the New Zealand university, which by royal charter, is entitled to grant degrees. There is a liberal scholarship system in connection with the universities.

The following table shows the increased expenditure on education:—

	Expenditure from public funds	Expenditure per head of mean population
	£	s. d.
1900	980,000	19 6
1915	1,378,000	24 1
1921	3,224,000	51 6
1926	3,814,434	54 10
1927	3,910,241	55 1

Finance.—The gross national debt, which at March 31, 1910, stood at £74,890,645 (£72 6s. 10d. per head of population), at March 31, 1927, amounted to £245,850,889 (£170 19s. 5d. per head). This is the gross amount, and against it are accumulated sinking funds. With the exception of that portion incurred for war purposes, the greater portion of the borrowings has been for productive and developmental purposes, resulting in revenue-producing assets such as railways, hydro-electrical installations, telegraphs and telephones. The war debt to the Imperial Government had been funded and repayment is already well advanced.

The following table shows the revenue and expenditure for financial year periods from 1910 to 1925:—

Year ending March 31	Revenue	Expenditure	Excess of revenue over expenditure
	£	£	£
1910	9,238,917	8,990,022	247,995
1915	12,451,945	12,379,803	72,142
1920	26,081,340	23,781,524	2,299,816
1925	28,643,000	27,399,200	1,243,800
1927	24,943,107	24,355,965	587,142

The details of revenue and expenditure for the same years were:—

Chief Sources of Revenue

Year ending March 31	Taxation	Railways	Post and telegraphs	Crown lands	Other sources
	£	£	£	£	£
1914 . . .	5,918,034	4,028,739	1,260,022	262,846	750,120
1921 . . .	22,184,414	6,918,492	2,478,532	310,641	2,359,882
1925 . . .	16,172,306	7,105,106	2,706,882	211,740	2,446,057
1927 . . .	16,899,556	*2,043,433	3,226,558	202,186	2,571,374

*Under the new system of railway finance the figures for 1927 represent interest on railway capital liability only.

Principal Expenditures

Year ending March 31	Working railways	Post and telegraphs	Education	Interest etc., on public debt	Other expenses
	£	£	£	£	£
1914 . . .	3,004,181	1,170,883	1,206,678	2,887,981	3,556,141
1921 . . .	6,211,911	2,588,300	2,033,977	7,831,593	8,803,789
1925 . . .	5,636,583	2,413,436	2,777,271	8,862,644	7,700,266
1927 . . .	429,068	2,343,438	3,070,096	9,745,932	8,767,431

These tables show that revenue from taxation increased very considerably from 1914 to 1921, but fell heavily from 1921 to 1925. The public services (chiefly railways and post and telegraphs) increased their revenue after 1921, while the costs of their administration were reduced, the results of severe economies.

The movement of direct and indirect taxation from 1914 to 1927 is shown in the following table:—

Direct and Indirect Taxes

Year ending March 31	Customs and excise	Land tax	Income tax	Death duties
	£	£	£	£
1914 . . .	3,553,785	707,451	554,271	613,751
1917 . . .	4,037,628	713,118	4,262,126	570,040
1921 . . .	8,769,251	1,688,979	8,248,945	1,106,925
1922 . . .	5,554,334	1,637,816	6,002,987	1,512,754
1927 . . .	9,016,862	1,229,067	3,422,216	1,690,374

Banking.—There are six banks of issue operating in the dominion, two of them, the Bank of New Zealand and the National Bank of New Zealand, being incorporated by special acts of the general assembly of the dominion. In 1927 the Bank of New Zealand had branches and agencies numbering 223, and the other five between them 281, making a total of 504.

Development of Banking, 1910-26

	Deposits	Advances	Assets	Liabilities
	£	£	£	£
1910 . . .	24,968,761	18,439,999	26,398,927	26,742,081
1920 . . .	59,405,341	38,241,932	56,111,433	67,818,469
1921 . . .	49,397,411	50,607,541	68,701,282	58,808,439
1922 . . .	45,913,394	44,768,178	61,779,570	53,868,834
1924 . . .	49,592,499	44,559,661	61,325,865	57,131,235
1926 . . .	59,135,114	49,149,260	65,765,297	58,008,161

The number of open accounts in the Post Office Savings Bank at the end of 1910 was 380,585; at the end of 1915, 509,085; and at March 31, 1927, 783,827. In 1910 (calendar year) the proportion of open accounts to the total population was 1 in every 2.76; in 1927 (March 31) the proportion was 1 in every 1.82. The deposits and withdrawals in the calendar year 1910 were £10,708,939 and £9,695,515 respectively; and in 1927 (March 31) £29,456,383 and £30,149,629 respectively. The amount standing to credit of all accounts in 1910 (Dec. 31) was £14,104,990, and in 1927 (March 31) £48,985,502.

DEFENCE

Military.—A strong force of New Zealand mounted infantry took part in the Anglo-Boer War of 1899-1902. In the World War, 128,525 New Zealanders joined the New Zealand military forces and 98,950 of them served overseas in the campaigns in Gallipoli, Egypt, Salonika, France and Belgium, and Palestine, suffering 58,501 casualties, without counting those who died in the United Kingdom. The total included over 2,500 officers. The total of those who volunteered or were called up under an Act of August 1916 numbered 231,439, of which number about 102,000, obtained by ballot, had not yet joined training camps in November 1918. The military forces of New Zealand now (1928) include a permanent force to administer and train the forces, a territorial force, reserve, cadets, and nursing service, with provision for raising additional military forces on mobilization.

Recruiting Service and Organization.—The permanent force is filled by voluntary enlistment for 5 years' service with the colours, followed by 3 in the reserve. All male resident British subjects who have resided in New Zealand for 6 months between the ages of 18 and 30 years are liable to training in the territorial force, and if between the ages of 14 and 18 to be trained as senior cadets. There are also rifle clubs, in which those not in the defence forces learn to shoot. Service in the territorial force is for 3 years with 6 days' annual training in camp besides parades and drills. The signal corps, instead of attending camp, do four courses, each of one week, of 3 hours' training daily. The total strength of the permanent force is about 500, including about 120 officers but excluding the air force of about 16. The territorial force (limited by law to 30,000) numbers (1927) about 22,500, including about 1,240 officers. About 14,000 cadets are posted annually for training. The organization of the permanent force includes a staff corps, artillery, air force, permanent staff, ordnance, pay, medical and army service corps. The territorial force is organized in 3 mounted rifle brigades, 3 field artillery brigades, 2 pack or light brigades (howitzers), 4 medium batteries, 2 coast batteries, 3 signal and 3 engineer companies, 3 infantry brigades, and a corresponding number of companies of army service and medical corps. Other auxiliary units are formed on mobilization.

Higher Command and Distribution.—The government of the forces is vested in the Crown. The minister of defence is charged with administration, his decisions and instructions being issued by the general officer in active command, through the three local commanders in the northern (Auckland), central (Wellington), and southern (South Island) commands. Military headquarters are at Wellington. There is a ministry of defence with the usual departments and a general staff. Also an advisory air board. Each command is divided into 4 regimental districts which provides a battalion and a proportion of the other units mentioned above.

The training establishments include a general headquarters school for officers and others both of the permanent and territorial forces. Also schools for equitation, small arms, artillery, signals, education, and machine-guns. Some of the harbours are provided with coast defences. A small air force has recently been established with permanent personnel for instruction and charge of a new aerodrome at Christchurch, and territorial personnel with previous experience in air forces of the British Empire. The above-mentioned air board includes 3 naval and military and 5 civilian officials. The present permanent establishment of the New Zealand air force numbers only 5 officers and 19 other ranks.

(See also the *League of Nations Armaments Year-book* (Geneva 1928). (G. G. A.)

Naval.—Until 1895 New Zealand had made no contribution towards the cost of naval defence, but in that year the Colony agreed to pay £20,000 annually towards the upkeep of the squadron in her waters and in 1903 the yearly contribution was doubled. Five years later the contribution of the Dominion was again increased to £100,000 for a period of ten years, and

the New Zealand people patriotically presented to the Imperial Government, the battlecruiser "New Zealand." This ship visited the Dominion in 1913 and her visit resulted in the inauguration of the New Zealand Royal Naval Reserve. This force, voluntarily recruited for twelve years service commenced the building up of a naval *personnel*, to be at the disposal of the Imperial Government in war time. The cruiser "Philomel" was commissioned as a training ship but before training could commence, war broke out, and she was returned to the Admiralty and employed in the Indian Ocean. In 1919, the "Philomel," refitted as a training ship, returned to New Zealand and, following the visit of Lord Jellicoe to the Dominion as Naval Adviser, the "New Zealand Division of the Royal Navy" was constituted, under the direction of a navy board and legislation placed the New Zealand Royal Navy and Royal Naval Volunteer Reserves upon a permanent footing. The battlecruiser "New Zealand" was scrapped under the Washington Treaty. The cruiser "Chatham" was lent to the New Zealand Government and in 1924-5 her place was taken by the two more modern cruisers "Dunedin" and "Diomedea." These ships, which are manned chiefly by *personnel* lent from the Royal Navy, are lent free of charge by the Imperial Government to New Zealand, the Dominion bearing all expense of the *personnel* and the upkeep of the ships. In addition to the "Philomel" a trawler is maintained for training the Royal Naval Reserve and two sloops, at the charge of the Imperial Government, police the South Pacific Islands. At Auckland, a small naval base, fuelling and training establishment provides the needs of the New Zealand Division, the upkeep of which, in 1926-7 cost the Dominion £616,400. (S. T. H. W.)

AGRICULTURE AND INDUSTRY

Agriculture.—New Zealand is primarily a grazing country, largely because better financial returns are obtained from the pastoral industries. Grain crops, principally oats and wheat, are chiefly grown in the eastern and southern districts of the South Island; barley is also grown, but to a very much smaller extent. Before the 1915-16 season agricultural statistics were rarely correct, owing to the unsatisfactory methods of collecting returns.

Acreage and Yield of Principal Crops, 1917-27

Season	Wheat		Oats		Barley		Maize		Peas and beans	
	Area thous. ac.	Quantity thous. bu.	Area thous. ac.	Quantity thous. bu.	Area thous. ac.	Quantity thous. bu.	Area thous. ac.	Quantity thous. bu.	Area thous. ac.	Quantity thous. bu.
1917-18	281	6,808	156	4,943	19	569	8	368	12	313
1918-19	208	6,568	173	6,885	19	711	10	414	18	506
1919-20	140	4,560	180	6,968	23	816	9	406	14	369
1920-21	220	6,872	148	5,225	47	1,587	15	501	14	355
1921-22	353	10,565	171	6,753	33	1,152	11	488	13	339
1922-23	276	8,395	143	5,688	17	598	20	506	24	698
1923-24	174	4,175	64	1,964	21	597	8	406	19	363
1924-25	167	5,448	147	5,797	25	798	9	427	14	411
1925-26	152	4,617	102	4,116	26	947	9	424	12	288
1926-27	220	7,952	117	4,998	30	1,243	10	491	15	455

The table shows the variability of the wheat acreage and grain imports are often necessary; in 1926 Australia sent New Zealand 1,697,385 bushels. About 14,000 persons were employed in agriculture in 1928. The area under potatoes in 1925-26 was 24,616 ac., yielding a return of 116,771 tons. Other root crops are grown on a large scale for winter feed and for stock fattening purposes.

The Department of Agriculture, under a director-general with divisional heads controlling chemistry, live stock, dairy fields and horticultural sections, is concerned mainly in advancing the interests of primary production. The sum allocated to this department in 1927-28 was £365,610. While the service is mainly educational, it is also responsible for the inspection and grading of all produce exported from the country. Experimental farms and horticultural stations are maintained in various localities, and farmers are assisted by visits and letters of advice. A Board of Agriculture was established in 1913 to advise the minister for agriculture upon matters relating to the development of agricultural and other rural industries.

Pastoral Industry.—The number of dairy cows in the dominion in 1910 was 804,078, while in 1928 it had risen to 1,352,398. The dairy industry is largely conducted upon a co-operation basis, and the most up-to-date mechanical aids are used. In 1927, 17,090 milking plants were in operation, milking 753,751 cows each day, and 45,246 cream separators were in use on the farms. There were 243 butter, 269 cheese, and 68 dual (butter and cheese) factories. Over 76,000 persons were employed in the industry.

Pastoral products comprised over 90% of total exports in 1928. The dairy industry is rapidly developing. The same may also be said of the sheep-rearing industry. Farmers are more generally than ever before applying artificial, top-dressing manures to their pastures. More attention, especially in the dairy industry, is being given to the breeding and selection of the animals. During the post war period two important branches of the dairy industry were developed: the manufacture of casein and of dried milk. In 1927, 10,865,290 lb. of dried milk, valued at £308,101 were exported, and 46,763 cwt. of casein valued at £141,388. Preserved milk was exported of a value of £38,170. Honey production is another rapidly developing industry; and the export of apples increased from 400,000 cases in 1927 to 1,000,000 in 1928.

The number of sheep and lambs in the dominion in 1928 was 27,133,810. This is the highest figure yet reached. In 1879 the number was 11,570,000; and from then on there was a steady annual increase to the year 1894 when the 19,000,000 mark was reached, after which the figure remained stationary to 1907. It then again gradually went up to 26,000,000 in 1918, and fell to 23,000,000 until 1925. In 1927 the number had increased to 25,649,000; and 1928 saw a further increase of 1½ millions, notwithstanding heavier mutton and lamb exportations than ever before. Only a comparatively small proportion of the frozen meat exported from New Zealand is beef, for the price of frozen beef on the British market is low owing to competition with the chilled article from South America. As a result of this competition markets other than Britain are being sought. Shipments of frozen pork are rapidly increasing. In 1927 there were 43 meat freezing and preserving works in the dominion, employing 5,798 hands.

Co-operation.—One of the greatest aids to the development of the primary industries has been the application of the principle of co-operation, particularly in the case of the dairy industry. The farmers have their co-operative companies, arrange their own finance, and receive monthly cheques—based on a percentage of the prices current on the British market, any surplus over the amounts paid out being subsequently distributed proportionately as a bonus. This system largely obviates the necessity for extensive capital.

After 1922 co-operative marketing in a modified form was put into operation by the meat producers. Under the Meat Export Control Act, 1921-22, the meat industry obtained powers to set up a board, elected by all the sheep and cattle farmers in the dominion, to supervise the industry, shipment and marketing of the produce. The board consists of eight members, five representing the producers and one the stock and station agents, while two are appointed by the Government. Since its inception much useful work has been done, chiefly in regard to the marking of parcels, grading of meat, loading and discharging, regulation of shipments

and in arranging satisfactory rail and sea freights and freezing charges. The dairy producers obtained power under the Dairy Produce Export Control Act, 1923, to set up a somewhat similar board. Both bodies have representation in London by managers. The fruit and honey producers also have similar organizations governing their export affairs.

Afforestation.—A very active and progressive policy is pursued in reafforestation. The first organized attempt with imported trees, chiefly European larch, Austrian pine, Corsican and western yellow pine and a variety of eucalypti, was made in 1896, when an afforestation section of the Lands Department was formed. This work continued with more or less progress until 1919, when a separate forestry department was set up, and was reorganized in 1920 as the State Forest Service. Then in 1921–22 the Forests Act was passed defining the forest authority as the minister of forestry, the Director of Forestry, with a secretary, five conservators, a milling expert, an engineer in forest products, and various sub-officials. The total personnel in 1927 was 111. At March 31, 1927, the area dedicated to forestry and conservation was 7,656,844 acres. The total expenditure on State afforestation up to March 31, 1927, was £848,453, the area of State plantations being 98,891 acres; in the year 1924 and subsequently local bodies, owners of private lands, tree and planting companies, etc., developed great afforestation activities, and to these the State has supplied some 23,000,000 trees.

Fisheries.—Although New Zealand possesses a most valuable asset in the great quantities of edible fish in the seas around her coasts, very little had been done up to 1925 in the systematic exploitation of the industry. In the year ending March 31, 1927, 327,562 cwt. of fish, valued at over £400,000, were brought in from the fishing grounds. In addition, the produce of the oyster fisheries was valued at £27,824, and of the whale fisheries at £7,000. Exports in 1926 totalled £71,568 in value. In 1926, 3,217 persons were employed in the fishing industry.

Minerals and Mining.—The gold-mining industry has declined in importance: up to 1926 the total value of gold exported was £92,403,399, the value for 1926 being £516,207. Gold is now almost solely obtained by dredging and sluicing. Silver is obtained in small quantities: up to 1926 total exports were valued at £3,016,660. The exploitation of iron ore and iron sand, of which there are plentiful deposits of the best quality, has not greatly progressed, though enterprise is reviving. During the World War, tungsten ore mining became very active, but the fall in prices during the post-war period caused a collapse in the industry; the export of sheelite (tungsten ore) fell from 266 tons in 1916 to 15 tons in 1926. Copper, manganese ores, platinum, cinnabar, tin and sulphur are also found. Coal is mined for local consumption. The deposits are very extensive, the proved resources amounting to 660,000,000 tons; in 1910 2,197,362 tons were produced, and in 1926, 2,239,999 tons. Kauri gum, the fossilized resin of the Kauri tree, is classed as a mineral, and during 1926, 4,877 tons of gum valued at £332,765 were exported. The total quantity of gum exported to the end of 1926 was 399,299 tons, valued at £21,855,751.

Secondary Industries.—Manufacturing industry had been but little developed up to 1908. The principal branches of industry, however, advanced considerably after 1910, with a tendency to greater diversity in production as the population increased. Owing to changes in system of collecting industrial data, and in the classification of industries made in various periods, together with the fact that the statistical data available include the dairy produce and meat handling establishments, it is not possible to give accurate tables to indicate the progress made. Including small-scale establishments, the dominion had about 100 distinct manufacturing industries in 1928. Woollen factories supplied a large proportion of the internal requirements: much ready-made clothing is manufactured locally, and also furniture and footwear as well as other commodities.

Engineering and the manufacture of metal products are increasing in importance. Motor and cycle engineering, motor body building and the manufacture of chemicals, brushware and glassware are comparatively new industries which are making rapid

headway. The Government, through an Industries and Commerce Department, encourages and assists secondary manufacture, and the customs tariff is scientifically arranged to foster such industries as are capable of development. The total number of employees engaged in factories in 1925–26 was 81,700. The value of the products of manufacturing industries in 1926 was £85,000,000. This sum includes semi-primary industries engaged in the preparation of agricultural and pastoral produce for export with products valued at £35,000,000.

Water Power.—The Public Works Act, 1908, vested in the Crown the sole right to use the water power of the dominion, subject to any existing rights, and gave the government the right to develop such power. The Aid to Water Power Works Act, 1910, empowered the State to establish hydro-electric supply installations. The Lake Coleridge scheme to supply Christchurch was the first undertaking and was completed in 1915; in 1925 it was extended to supply up to 36,000 kilowatts. At the close of the World War a policy of concentration on works to supply the whole dominion was adopted. The Mangahao system to supply Wellington and the Wellington province came into operation in 1925. Work is proceeding on the Arapuni scheme to supply Auckland and the Auckland province and is well advanced. Under legislation passed in 1918, and later amendments, 43 districts were constituted to administer and finance the supply of power in created districts. The full development of the schemes in progress in 1927 will give the following results:—

North Island	H.P.
Mangahao (Wellington province)	24,000
Waikaremoana (East Coast)	40,000
Arapuni (Auckland)	96,000
South Island	H.P.
Coleridge (Canterbury)	36,000
Waipori (Otago)	25,000
Monowai (Southland)	16,000

The progress of development (in H.P.) was as follows:

1915	1921	1925	1927
43,016	51,114	70,143	148,979

The total cost to March 31, 1927, including capital outlay, stocks and debit balances on trading accounts, was £6,428,397; statutory authorizations existed for £10,830,000. In 1925 there were 56 power distributing stations. The total water power resources are estimated at 4,109,950 horsepower.

TRADE AND COMMUNICATIONS

Trade.—The external trade of New Zealand rapidly developed after the World War and, to a lesser degree, in the years immediately preceding, as is shown in the following table:

Year	Exports	Imports	Total Trade
	£	£	£
1909	19,661,996	15,674,719	35,336,715
1914	26,261,447	21,856,006	48,117,543
1918	28,516,188	24,234,007	52,750,195
1922	42,726,249	35,012,561	77,738,810
1923	45,967,165	43,378,403	89,345,668
1924	52,612,711	48,527,603	101,140,314
1926	45,275,575	49,889,563	95,165,138
1927	48,490,354	44,782,946	93,273,300

The years 1924, 1925 and 1926 were periods of abnormal prices, and there was also over-heavy importing. The present production is greater than in those years and the volume of exports is heavier, and economy in buying abroad is exercised.

The *per capita* value of exports in 1910 was over £21, and in 1927 £33. The imports *per capita* in the same years were £16 and £31 respectively. (Imports are valued at the current domestic value in the country of export plus 10% to cover "charges, freight and insurance"; exports are valued f.o.b.)

The tables on the following page show the values in thousands of pounds and quantities in thousands of hundredweight or pounds, of the principal exports for certain years:—

Exports: Values and Quantities (000's omitted)

Year	Wool		Frozen Meat		Butter		Cheese		Skins, Hides and Pelts
	Value	Quantity	Value	Quantity	Value	Quantity	Value	Quantity	Value
	£	lb.	£	cwt.	£	cwt.	£	cwt.	£
1910	8,308	204,309	3,851	2,654	1,812	357	1,195	45 ²	1,120
1914	9,318	220,473	5,863	3,230	2,339	434	2,564	864	1,318
1922	11,882	321,533	8,387	3,518	9,042	1,120	4,687	1,161	2,054
1924	15,268	206,190	9,490	3,159	11,642	1,269	7,023	1,594	3,144
1926	11,830	213,154	8,656	3,534	8,695	1,168	5,939	1,461	3,204
1927	12,961	*	9,080	3,236	10,915	1,456	5,582	1,402	3,140

*Not available.

The successful application of refrigeration to the sea-carriage of apples and eggs opened up great possibilities, and the volume of exports is rapidly increasing. In the 1926 season some 600,000 cases of apples were shipped to Britain; in 1925 the quantity was only 200,000 cases, the value of which was £116,101. In 1928, one million cases were exported but the value of the export is not available. Honey exported in 1925 totalled 1,822,043 lb.

Other exports of minor importance and their values in 1927 were: hemp, £473,221; sawn timber (chiefly to Australia), £425,316; kauri gum, £278,632; gold, £534,639. The following table shows the value of goods exported to each of the chief markets in 1927:

	Value	Per cent of total
To Great Britain	£36,877,887	76.04
To United States of America	2,748,313	5.53
To Australia	3,670,462	8.07
To Germany	1,139,654	2.35

The principal import groups are: clothing and textiles, metals and machinery, sugar, tea, alcoholic liquors, tobacco, paper and stationery, oils, motor vehicles and accessories, chemicals, drugs and timber. Imports of motor-vehicles and oils (including motor spirits) have increased very rapidly: before 1911 their value was less than £300,000 annually, but in 1927 the amount was £4,706,000. The following table shows the imports for 1910 and 1927 classified as to origin:

Year	Great Britain	Other British countries	Foreign countries
	£	£	£
1910	10,498,771 (61.57%)	3,967,053 (23.27%)	2,585,750 (15.16%)
1927	21,462,977 (47.93%)	9,254,070 (20%)	14,065,890 (31%)

In 1910 the figures represent the countries of shipment, whereas those for the second period are of the countries of origin. In 1910 imports from Australia were valued at £1,520,000, and in 1927, £3,870,636; imports from the United States were £1,399,737 and £8,596,275 respectively.

Customs Duties.—In 1915 changes were made in the rates of duty levied on certain articles to meet the extraordinary expenses of the year, and in 1917 additional war impositions were made, these rates remaining in force until the coming into operation of the 1921 revised tariff. The revenue from customs duties in 1910 was £2,954,989, and in 1927, £8,252,575. The dominion's system of imperial preference extends to all British countries. The principle was extended in 1921 and again in 1928. Under the last revision the excess duty payable on foreign goods became, in general, 20% as compared with 15% under the 1921 tariff, and 10% prior to that year. Australia has a special reciprocal tariff agreement with New Zealand, arranged in 1922, and does not come under the general British preferential provision. In 1928 about one-half the total imports from the British empire were admitted free of duty.

Communications and Transport.—The railways from the earliest days have been owned, built and operated by the State. Their construction, to provide access to all parts of the country,

has ranked always in the forefront of public enterprise. Progress in recent years is shown in the following table:

	Length open (miles)	Revenue (gross)	Expenditure
		£	£
1910	2,717	3,249,700	2,109,474
1920	2,996	5,752,487	4,105,067
1925	3,085	7,112,524	5,545,410
1928	3,200	8,034,970	6,685,123

The capital value of the railways (including unopened lines and assets) was (1927) £56,028,477. The state builds its own rolling stock and locomotives, and is providing extensive new railway workshops. In 1924 the whole control of managerial organization was changed, the affairs being placed under the control of a board responsible to the minister, but a further change was made in 1928 and a general manager placed in charge.

Important railway works were carried out during the post 1914-18 period. The North Main Trunk was extended from Auckland to beyond Whangarei; sections were constructed on the east coast of North island, and a tunnel (5½ m.) through the Southern alps at Arthur's pass, to link up the railheads in the Westland and Canterbury provinces, was completed and electrified in 1923. Railway extension work has been slow and costly, as the sections of country requiring linking-up are of a mountainous character. Duplications have been made in city suburban areas, and works are in progress to obviate the heavy grades running out of Wellington city.

In 1925 there were 64,625 m. of roads in the dominion, 28,553 m. of which were metalled. By the Main Highways Act (1922) main highways are under the administration of a highways board. This step has been rendered necessary by the heavy increase that has taken place in motor traffic. (H. J. B. D.)

HISTORY

The date, even the approximate date, of man's arrival in New Zealand is uncertain. All that can be safely asserted is that by the 14th century A.D. Polynesian canoe-men had reached its northern shores in successive voyages. By 1642 they had spread to South island, for there Abel Jansen Tasman found them when, in the course of his circuitous voyage from Java in the "Heemskirk," he chanced upon the archipelago, coasted along much of its western side, though without venturing to land, and gave it the name it still bears. One hundred and thirty-seven years later, Cook, in the barque "Endeavour," gained a much fuller knowledge of the coasts, which he circumnavigated, visited again and again, and mapped out with fair accuracy. He annexed the country, but the British Government disavowed the act. After him came other navigators, French, Spanish, Russian and American; and, as the 18th century neared its end, came sealers, whalers and trading-schooners in quest of flax and timber. English missionaries, headed by Samuel Marsden, landed in 1814, to make for many years but slow progress. They were hindered by murderous tribal wars in which muskets, brought in first by the chief Hongi, more than decimated the Maori. Still, cruel experience and the persevering preaching of the missionaries gradually checked the fighting, and by the year 1839 peace and Christianity were in the ascendant. So far the British Government had resisted any pres-

sure brought to bear in Downing street in favour of annexation. In vain Edward Gibbon Wakefield, organizer of colonizing associations, prayed and intrigued for permission to repeat in New Zealand the experiment tried by him in South Australia. Lord Glenelg, the colonial minister, had the support of the missionaries in withstanding Wakefield's New Zealand company, which at length resolved in desperation to send an agent to buy land wholesale in New Zealand and despatch a shipload of settlers thither without official permission. Before, however, the "Tory" had thus sailed for Cook strait, it had become known to the English Government that a French colonizing company—*Le Compagnie Nantobordelaise*—was forming, under the auspices of Louis Philippe, to anticipate or oust Wakefield. With the assent of the Protestant missionaries the British authorities reluctantly instructed Captain Hobson, R.N., to make his way to northern New Zealand with a dormant commission of lieutenant-governor in his pocket and authority to annex the country to Australia by peaceful arrangement with the natives. Hobson landed in the Bay of Islands on Jan. 22, 1840, hoisted the Union Jack, and had little difficulty in inducing most of the native chiefs to accept the queen's sovereignty at the price of guaranteeing to the tribes by the treaty of Waitangi possession of their lands, forests and fisheries. Some French settlers, convoyed by a man-of-war, reached Akaroa in South island in the May following. But Hobson had forestalled them, and those who remained in the country became British subjects. Meanwhile, a week after Hobson's arrival, Wakefield's colonists had sailed into Port Nicholson, and proposed to take possession of immense tracts which the New Zealand company claimed to have bought from the natives, and for which colonists had in good faith paid the company. Other bands of company's settlers in like manner landed at Nelson, Wanganui and New Plymouth, to be met with the news that the British Government would not recognize the company's purchases. Then followed weary years of ruinous delay and official inquiry, during which Hobson died after founding Auckland. His successor, Fitzroy, drifted into an unsuccessful native war. A strong man, Captain Grey, was at last sent over from Australia to restore peace and rescue the unhappy colony from bankruptcy and despair. Grey, much the best of the absolute governors, held the balance fairly between the white and brown races, and bought large tracts of land for colonization, including the whole South island, where the Presbyterian settlement of Otago and the Anglican settlement of Canterbury were established by the persevering Wakefield.

SELF-GOVERNMENT

In 1852 the mother-country granted self-government, and, after much wrangling and hesitation, a full parliamentary system and a responsible ministry were set going in 1856. For 20 years thereafter the political history of the colony consisted of two long, intermittent struggles—one constitutional between the central Government (first seated at Auckland, but after 1864 in Wellington) and the powerful provincial councils, of which there were nine charged with important functions and endowed with the land revenues and certain rating powers. The other prolonged contest was racial—the conflict between settler and Maori.

The Maori Wars.—The native tribes, brave, intelligent and fairly well armed, tried, by means of a league against land-selling and the election of a king, to retain their hold over at least the central North Island. But their kings were incompetent, their chiefs jealous and their tribes divided. Their style of warfare, too, caused them to throw away the immense advantages which the broken bush-clad island offered to clever guerrilla partisans. They were poor marksmen, and had but little skill in laying ambushes. During ten years of intermittent marching and fighting between 1861 and 1871 the Maori did no more than prove that they had in them the stuff to stand up against fearful odds and not always to be worsted. Round Mount Egmont, at Orakau, at Tauranga and in the Wanganui jungles, they more than once held their own against British regiments and colonial riflemen. The storming of their favourite positions—stockades strengthened with rifle-pits—was often costly; and a strange anti-Christian fanaticism, the Hau-Hau cult, encouraged them to face the white men's

bullets and bayonets. But even their fiercest fighting leaders, Rewi and Te Kooti, scarcely deserved the name of generals. Some of the best Maori fighters, such as the chiefs Ropata and Kemp, were enlisted on the white side, and with their tribesmen did much to make unequal odds still more unequal. Had Gen. Pratt or Gen. Cameron, who commanded the imperial forces from 1860 to 1865, had the rough vigour of their successor, Gen. Chute, or the cleverness of Sir George Grey, the war might have ended in 1864. Even as it was the resistance of the Maori was utterly worn out at last. After 1871 they fought no more. The colonists too, taught by the sickening delay and the ruinous cost of the war to revert to conciliatory methods, had by this time granted the natives special representation in parliament. A tactful native minister, Sir Donald McLean, did the rest. Disarmament, roads and land-purchasing enabled settlement to make headway again in the North island after 12 years of stagnation. Grey quarrelled with his masters in Downing street, and his career in the imperial service came at an end in 1868. His successors, Sir George Bowen, Sir James Ferguson, the marquess of Normanby and Sir Hercules Robinson, were content to be constitutional governors and to respect strictly the behests of the Colonial Office.

Sheep-farming and the Discovery of Gold.—Meanwhile the industrial story of New Zealand may be summed up in the words wool and gold. Extremely well suited for sheep-farming, the natural pastures of the country were quickly parcelled out into huge pastoral Crown leases, held by prosperous licensees, the squatters, who in many cases aspired to become a country gentry by turning their leases into freeholds. So profitable was sheep-farming seen to be that energetic settlers began to burn off the bracken and cut and burn the forest in the North island and sow English grasses on the cleared land. In the South artificial grassing went on for a time hand in hand with cereal-growing, which by 1876 seemed likely to develop on a considerable scale, thanks to the importation of American agricultural machinery, which the settlers were quick to utilize. Even more promising appeared the gold-fields. Gold had been discovered in 1853. Not, however, until 1861 was a permanent field found—that lighted upon by Gabriel Read at Tuapeka in Otago. Thereafter large deposits were profitably exploited in the south and west of South island and in the Thames and Coromandel districts of the Auckland province. Gold-mining went through the usual stages of alluvial washing, deep sinking, river-dredging and quartz-reef working. Perhaps its chief value was that it brought many thousand diggers to the colony, most of whom stayed there. Pastoral and mining enterprise, however, could not save the settlers from severe depression in the years 1867 to 1871. War had brought progress in the north to a standstill; in the south wool-growing and gold-mining showed their customary fluctuations. For a moment it seemed as though the manufacture of hemp from the native *Phormium tenax* would become a great industry. But that suddenly collapsed, to the ruin of many, and did not revive for a number of years.

In 1870 peace had not yet been quite won; industry was depressed; and the scattered and scanty colonists already owed seven millions sterling. Yet it was at this moment that a political financier, Sir Julius Vogel, in that year colonial treasurer in the ministry of Sir William Fox, audaciously proposed that the central Government should borrow ten millions, make roads and railways, buy land from the natives and import British immigrants. The House of Representatives, at first aghast, presently voted four millions as a beginning. Coinciding as the carrying out of Vogel's policy did with a rising wool market, it for a time helped to bring great prosperity, an influx of people and much genuine settlement. Fourteen millions of borrowed money, spent in ten years, were on the whole well laid out. But prosperity brought on a feverish land speculation; prices of wool and wheat fell in 1879 and went on falling. Faulty banking ended in a crisis, and 1879 proved to be the first of 16 years of almost unbroken depression. Still, eight prosperous years had radically changed the colony. Peace, railways, telegraphs (including cable connection with Europe), agricultural machinery and a larger population had carried New Zealand beyond the primitive stage. The provincial councils had been swept away in 1876, and their functions divided

between the central authority and small powerless local bodies. Politics, cleared of the cross-issues of provincialism and Maori warfare, took the usual shape of a struggle between landed wealth and radicalism. Sir George Grey, entering colonial politics as a Radical leader, had appealed eloquently to the work-people as well as to the Radical "intellectuals," and though unable to retain office for very long he had compelled his opponents to pass manhood suffrage and a triennial parliaments act. A national education system, free, non-religious and compulsory, was established in 1877. The socialistic bent of New Zealand was already discernible in a public trustee law and a State life insurance office. But the socialistic labour wave of later years had not yet gathered strength. Grey proved himself a poor financier and a tactless party leader. A land-tax imposed by his government helped to alarm the farmers. The financial collapse of 1879 left the treasury empty. Grey was manoeuvred out of office, and Sir John Hall and Sir Harry Atkinson, able opponents, took the reins with a mission to reinstate the finances and restore confidence.

Politics.—Roughly speaking, both the political and the industrial history of the colony from 1879 to 1928 may be divided into three periods. The dividing line, however, has to be drawn in different years. Sixteen years of depression were followed, from 1895 to 1921, by 26 years of great prosperity and in turn by six years of depression again until 1927. In politics nearly 12 years of Conservative government, or at least capitalistic predominance in public affairs, were succeeded by 20 years of radicalism. Only in 1912 did the Conservatives regain the office they still retain (1928). Up to Jan. 1891, the Conservative forces which overthrew Sir George Grey in 1879 controlled the country in effect though not always in name, and for 10 years progressive legislation was confined to a mild experiment in offering Crown lands on perpetual lease, with a right of purchase (1882), a still milder instalment of local option (1881) and an ineffective Factories Act (1886). In Sept. 1889, however, Sir George Grey succeeded in getting parliament to abolish the last remnant of plural voting. Finance otherwise absorbed attention; by 1890 the public debt had reached £38,000,000 against which the chief new asset was 1,300m. of railway, and though the population had increased to 650,000, the revenue was stagnant. A severe property-tax and an increase of customs duties in 1879 only for a moment achieved financial equilibrium. Although taxation was seconded by a drastic, indeed harsh, reduction of public salaries and wages (which were cut down by one-tenth all round) yet the years 1884, 1887, and 1888 were notable for heavy deficits in the treasury. Taxation, direct and indirect, had to be further increased, and as a means of gaining support for this in 1888 Sir Harry Atkinson, who was responsible for the budget, gave the customs tariff a distinctly protectionist complexion.

During the years 1879-90, the leading political personage was Sir Harry Atkinson. He, however, withdrew from party politics when, in Dec. 1890, he was overthrown by the progressives under John Ballance. Atkinson's party never rallied from this defeat, and a striking change came over public life, though Ballance, until his death in April 1893, continued the prudent financial policy of his predecessor. The change was emphasized by the active intervention in politics of the trade unions. These bodies decided in 1889 and 1890 to exert their influence in returning workmen to parliament, and where this was impossible, to secure pledges from middle-class candidates. This plan was first put into execution at the general election of 1890, which was held during the industrial excitement aroused by the Australasian maritime strike of that year. It had, however, been fully arranged before the conflict broke out. The number of labour members thus elected to the general assembly was small, never more than six for over 20 years and no independent labour party of any size was formed. But the influence of labour in the progressive or, as it preferred to be called, Liberal Party, was considerable and the legislative results noteworthy. Ballance at once raised the pay of members from £150 to £240 a year, but otherwise directed his energies to constitutional reforms and social experiments. These did not interfere with the general lines of Atkinson's strong and cautious finance, though the first of them was the abolition of his

direct tax upon all property, personal as well as real, and the substitution thereof of a land-tax of 1d. in the £ on capital value, and also of a graduated tax upon unimproved land values, and an income-tax also graduated, though less elaborately. The graduated land-tax, which has since been stiffened, rises from nothing at all upon the smaller holdings to about 7½d. in the £ upon the capital value of the largest estates. Buildings, improvements, and live stock are exempted. In the case of mortgaged estates the mortgagor is exempted from ordinary land-tax in proportion to the amount of his mortgage. In 1896 municipal and rural local bodies were allowed to levy rates upon unimproved land values if authorized to do so by a vote of their electors, and by the end of 1926 some 200 bodies, amongst them the city of Wellington, had made use of this permission. The income-tax is not levied on incomes drawn from the cultivation of land. In practice the smaller farmers pay neither land-tax nor income-tax. In 1891 the tenure of members of the legislative council or nominated upper house, which had hitherto been for life, was altered to seven years. In 1892 a new form of land tenure was introduced, under which large areas of Crown lands were leased for 999 years, at an unchanging rent of 4% on the prairie value. Crown tenants under this system had no right of purchase and did not obtain it until 1913. In 1892 a law was also passed authorizing Government to repurchase private land for closer settlement.

On Ballance's sudden death in April 1893, his place was taken by Richard Seddon, minister of mines in the Ballance cabinet, whose first task was to pass the electoral bill of his predecessor, which granted the franchise to all adult women. This was adopted in Sept. 1893, though the majority for it in the upper house was but two votes. In 1893 was enacted the Alcoholic Liquor Control Act, greatly extending local option. In 1894 was passed the Advances to Settlers Act, under which State money-lending to farmers on mortgage of freehold or leasehold land was at once begun. The money is lent by an official board, which deals with applications and manages the finance of the system. Borrowers must repay ½% of their principal half-yearly, and may repay as much more as they choose. Profits are paid over to an assurance fund. Very large sums—nearly 37 millions—have thus been lent while profits placed to reserve have far more than met losses. The sum out on loan in 1928 was about 19 millions. The same year also saw the climax of a series of 14 laws passed in five years affecting the relations of employers and workmen. These laws deal with truck, employers' liability, contractors' workmen, the recovery of workmen's wages, the hours of closing in shops and merchants' offices, conspiracy amongst trade unionists, and with factories, mines, shipping and seamen. In 1895 a law controlling servants' registry offices was added. In 1897 all shipowners engaging in the coasting trade of the colony were compelled to pay the colonial rate of wages.

Meanwhile the keystone of the regulative system had been laid by the passing of the Industrial Conciliation and Arbitration Act, under which disputes between employers and unions of workers are compulsorily settled by State tribunals; strikes and lock-outs are prohibited in the case of unions of work-people when registered under the act and the conditions of employment in industries may be, and in most cases are, regulated by public boards and courts. The years 1896, 1897 and 1898 were marked by struggles over the Old Age Pensions bill, which became law in Nov. 1898. In 1898 the divorce law was amended on the lines of the Stephen Act of New South Wales, a change which helped to treble the number of petitions for divorce in the next seven years. In 1898 also the municipal franchise, hitherto confined to ratepayers, was greatly widened; in 1900 the English system of compensation to workmen for accidents suffered in their trade was adopted with some changes, one of the chief being that contested claims are adjudicated upon cheaply and expeditiously by the same arbitration court that decides industrial disputes. In 1895 borrowing on a larger scale was begun, and in 12 years twice as many millions were added to the public debt. Before this the Ballance ministry had organized two new departments, those of labour and agriculture. The former supervised the labour laws and endeavoured to deal with unemployment; the latter has done

much practical teaching, inspection, etc. Meat, butter, cheese and New Zealand hemp were thenceforth graded and branded by departmental inspectors before export. For many years the Government has worked two coal-mines profitably, chiefly to supply its railways. The continued success of the Government life insurance office led in 1899 to the setting up of an accidents insurance office, and, in 1903, of a State fire insurance office.

The outbreak of the South African War in Oct. 1899 was followed in New Zealand by a prompt display of warlike enthusiasm; politics ceased to be the chief topic of interest; the general election of 1899 was the most languid held for 15 years. The desire of New Zealanders to strike a blow for the mother-country took the practical shape of despatching to South Africa ten contingents of mounted men who behaved with credit.

The many experimental laws summarized above were passed in the last years of the long depression. In 1895 began a marked commercial revival, mainly due to the steady conversion of the colony's waste lands into pasture; the development of frozen meat and dairy exports; the continuous increase of the output of coal; the invention of gold-dredging; the revival and improvement of hemp manufacture; the exploiting of the deposits of kauri gum; the reduction in the rates of interest on mortgage money; a general rise in wages, obtained without strikes, and partially secured by law, which has increased the spending power of the working classes. Undoubtedly also commercial confidence was restored by the reconstruction in 1895 of the Bank of New Zealand, and activity was stimulated by large public loans, while more cautious banking and the systems of taxation and rating on land values, adopted in 1891 and 1896, did something to check land speculation at any rate until about 1908.

The Reform Party.—Since 1890 two political parties have had curiously long terms of power. The party headed by Ballance, Seddon and Ward held office without a break for 21 years, a result mainly due to the general support given to its agrarian and labour policy by the smaller farmers and the working classes. In 1912 it fell and the more conservative side, which had by then taken the title of Reform Party, at last returned to office, a good deal changed in complexion after its long exile. Though at the moment of success it could claim but a small majority in parliament and none outside it has since controlled affairs and in 1925 scored a sweeping victory at the elections. This striking reversal of fortune was mainly due to two causes which, working from inside, disintegrated the progressives and lost them the support of their main props, the farmers and labour. The farmers growing in numbers and prosperity with the progress of settlement, the subdivision of the soil and continuance of good prices found themselves able to control parliament. They were aided by the electoral law which counts 100 rural residents as 128 electors, a privilege not extended to urban or suburban voters. In the earlier years of this century they organized their class into a powerful union. Noting the rising prices of land they decided to destroy the liberal system of State tenancy substituting the freehold tenure with complete right of sale under the cheap and speedy land transfer law. The Reform Party was prepared to give them this and numbers of them joined it. At the same time labour began to break away. With its grievances redressed and its position made comfortable by the Arbitration and other labour laws it saw little more was to be had from the progressives. Under their régime, moreover, very few Labour leaders gained seats in parliament. The influence of labour on politics though great was more or less indirect. Australia set the example of separate and successful Labour Parties, and after 1910 New Zealand Labour set out on the same path. The more extreme Labour men even desired to destroy the Arbitration law as the main pacifying influence and barrier to a class war. They succeeded at times in stirring up strife among three or four unions, such as the coal miners, waterside workers and hands in freezing factories, but though serious strikes occurred in 1913, 1916, and 1921-22 New Zealand has remained on the whole industrially pacific. The number of working hours lost to industry through conflicts has been far less than in any other country where labour is well organized. Experience has taught the unions the value to them

of the Arbitration law and in 1927 when it was attacked by the farmers they unanimously declared for it intact.

The World War Period.—The Reform Party began by granting the freehold according to promise, by passing a useful revision of the Education Act and also a law designed to put some check on strikes by unions not registered under the Arbitration Act. In 1914 came the World War and a coalition ministry of Reformers and Progressives was formed in which W. F. Massey the prime minister had the help of Sir Joseph Ward as finance minister, of Sir James Allen, an assiduous and resolute minister of defence, and of Sir Francis Bell, a leading barrister with a clear grasp of imperial affairs. New Zealand was not unprepared to be of service in war time. A law passed in 1909 paved the way for the compulsory training of the militia. Rifles had been procured from Canada, instructors and a general from England. Volunteers came forward with enthusiasm and their fine physique and complete submission to discipline were qualities which distinguished the New Zealand contingents through their long years of arduous service at Gallipoli, on the Western front and in Palestine. Respectable in numbers—84,000 of them took the field—the best witness to their valour and efficiency is found in the dry figures showing that, while they lost 17,000 by death and suffered more than 50,000 casualties, only 341 of them were captured by the enemy.

Heavy taxation and other severe war measures had to be endured in the dominion. Largely by forced loans from the banks and other direct taxpayers £55,000,000 were borrowed internally. No State currency notes were issued but bank notes were made—and still are—legal tender. The output of gold and the other chief products of food and raw material were commandeered at war prices for the imperial Government. There were protests—chiefly from labour—against conscription and some complaining from farmers who were left short-handed on their land. But on the whole the conduct of the people was patriotic and patient. Their war-debt, for their numbers enormous, finally exceeded £81,500,000; but the interest on it has been punctually paid. At the peace, New Zealand received a mandate to govern German Samoa, where her Administrator, Sir George Richardson, has by zealous and enlightened effort for the native race, arrested their decay and improved their material condition.

Social legislation was more or less at a standstill in war-time but an important change was made in the Liquor law. Local option was abandoned in favour of a triennial poll for and against national prohibition which may be voted by a bare majority. So far these polls have been in favour of the *status quo* though by somewhat small majorities. Thirteen districts which had "gone dry" under local option hold separate polls on the question; all but one of these adhere to "no licence." A practical reform closing all hotel bars at six P.M. appears to have reduced drunkenness.

After the War.—Peace was followed by three years of feverish prosperity and a wild speculation in rural land. Over £100 an acre was often paid for farms in the North island and when a very sudden fall of prices stopped the orgy in 1921 the reaction was extremely severe. Thousands had mortgaged themselves in buying freeholds without adequate capital and though nearly 1,000 farmers sought the bankruptcy court in the seven years 1921-27 and a larger number had to part with their holdings, the indebtedness of the rural population is still estimated at about £140,000,000. Owing to rural embarrassment a law of 1919 providing for a moratorium in the case of mortgages, other than trade mortgages, and of deposits, other than bank deposits, was continued until 1927.

After the war the Government had to deal with many thousands of demobilized soldiers without employment. It strove to do so by bestowing pensions on a liberal scale, by aiding men to find employment in the towns and by settling more than 9,000 soldiers on the land. This scheme of military settlements, excellent in intention, had to be carried out hastily and at a time when the price of land was highest. There was a good deal of miscalculation, dis-appointment and failure. The cost of the scheme so far (1928) has been about £30,000,000. After much rearrangement and writing down it seems likely that about three-fifths of the original

soldier-settlers will develop into well-to-do farmers.

In 1919 the progressive ministers withdrew from the Coalition in the belief that they could win the impending elections. While, however, labour held its own the progressives were decisively beaten and have since possessed little power in parliament. The Reformers continuing in office strove to meet industrial depression by economies in expenditure. The axe was applied to the departments. War bonuses were abolished and there have been some reductions of the land and income taxes. But borrowing by both Government and local bodies went on so that in 1927 the combined weight of taxes and rates was about £16 per head.

The general elections of 1922 left Massey with a bare majority in the House of Representatives. Labour captured 17 seats in a house of 84, but their hopeless division from the progressives enabled the Reformers just to hold their ground though comparatively little else could be done. Some of their more interesting post-war measures were the establishment of semi-official boards to regulate and control the export and sale of frozen meat, butter, cheese, fruit and kauri gum. Of these the meat board has, so far, been the most successful. The dairy control board in its first operations tried a fall with the middlemen of Tooley street and was badly beaten.

Massey, the veteran premier who had led the Reformers to victory in 1912, died in May 1925, after a long illness during which he had held on to his post indomitably. Sir Francis Bell took his place while the party settled the succession. It was given to Gordon Coates, a comparatively young New Zealand-born minister who like Massey was an Auckland farmer. He had served with credit in the war and had shown himself an energetic administrator of railways and public works. Hopes centred on this new figure helped the Reformers in the elections. Moreover, the electors were weary of a parliamentary stalemate and irritated against labour in general by the wild strikes of British seamen in the seaports of Australia and New Zealand. The result was the most complete triumph ever gained by a conservative party in the dominion. Labour won but 12 seats; the progressives only 11. Labour—which has since won two by-elections—became indeed the official Opposition. Yet it is true to say that, isolated as it is, labour as a class has now less political influence than it had 35 years ago.

In 1926 and 1927 the country had to face further falls in prices. In the second year it contrived none too soon to make exports exceed imports and an improvement in the export market came at the end of 1927. Attempts to help farmers took the form of an act to enable the Bank of New Zealand to issue long-dated mortgages, and two others to encourage the raising of rural credit bonds and set up a scheme of chattel mortgage associations with public help. A family allowances arrangement (1926) grants a dole to the larger families of the poorest class. A petrol tax, estimated to yield nearly three-quarters of a million, is to be spent in keeping up the country roads. A revised customs tariff (1927) has substantially increased the preference granted to goods of British origin.

NEXT FRIEND, in law, the phrase used for a person who represents in an action another person who is under the disability of infancy to maintain a suit on his own behalf. Every application to the court on behalf of an infant must be made through a next friend. Previous to the Married Women's Property Act 1882 it was also usual for a married woman to sue by a next friend, but that Act, allowing a married woman to sue in all respects as a *feme sole*, has rendered a next friend unnecessary in her case. In the case of an infant the father is *prima facie* the proper person to act as next friend; in the father's absence the testamentary guardian, if any; but any person not under disability may act as next friend so long as he has no interest in the action adverse to that of the infant. A married woman cannot, however, act as next friend, except in special cases. (See Rules of the Supreme Court, O. xvi. r. 16.) An infant defends a suit, not by a next friend, but by a guardian *ad litem*. A lunatic sues by his committee, but if he has no committee, or if the committee has some interest adverse to the lunatic, he sues by his next friend. A next friend has full power over the proceedings in the action as if he were an ordinary plaintiff, and he is therefore responsible for paying the costs, but he is not entitled to be heard in person. (See LUNACY.)

NEXT-OF-KIN: see KIN.

NEY, MICHEL (1769–1815), duke of Elchingen, prince of the Moskowa, marshal of France, was born at Saarlouis on Jan. 10, 1769. His father was a cooper, and he received only a rudimentary education. In 1788 he went to Metz and enlisted in a regiment of hussars; in 1792 he was elected lieutenant; and in 1794 he became captain and was placed by Kléber at the head of a special corps of light troops. He was soon promoted *chef de brigade*, and in 1796 general of brigade. He commanded the right wing of Hoche's army up to the peace of Campo Formio. On the resumption of hostilities he again took the field, and for his surprise of Mannheim in 1799 received the grade of general of division. He fought in the Swiss campaign of Masséna, and when Masséna turned against the Russians, who were approaching from Italy, Ney was left in command holding his ground successfully against the Austrians, although his opponent was the famous Archduke Charles. In 1800 he was present at Hohenlinden. In May 1802 he married Mâdemoiselle Auguié, whom Josephine had chosen for him at Bonaparte's request. This event marks a change in Ney's political opinions which can only be explained by Napoleon's power of captivating men. He was henceforward as ardent and sincere an admirer of Napoleon as hitherto he had been of revolutionary principles, and was one of the very few officers of the Army of the Rhine who became a trusted lieutenant of the emperor. He carried out an important mission in Switzerland, and in 1803 he was placed in command of the camp of Montreuil. While there he begged Napoleon to declare himself emperor, and on the establishment of the empire he was made marshal of France, and received the grand eagle of the Legion of Honour. In 1805 he commanded the VI. corps of the Grand Army, and his great victory at Elchingen (for which in 1808 he was made duke of Elchingen) practically secured the surrender of the Aus-

trians at Ulm. He was then ordered to the upper Adige, when he led the decisive attack at Friedland. After Friedland Napoleon gave him the title, "the bravest of the brave."

In 1808, after the first disaster to the French arms in Spain, Ney accompanied Napoleon there as commander of the VI. corps. He took part in the Peninsular War from 1808 to 1811. When acting under Masséna in the invasion of Portugal in 1810-11, he quarrelled bitterly with his former chief, and in spite of his distinguished service he was recalled to France by Napoleon and censured. He was re-employed with the *Grande Armée* in central Europe under Napoleon himself. In the 1812 expedition to Russia Ney commanded the centre at Borodino, and was created prince of the Moskowa on the evening of the victory. In the retreat he was a tower of strength, animating the rearguard with his own sublime courage, keeping the harassed and famished soldiers together under the colours and personally standing in the ranks with musket and bayonet. He was the last to recross the frontier, and threw the remaining muskets into the Niemen. In 1813 he commanded a corps in the German campaign, and in 1814 he shared in the campaign in France. At the fall of the Empire the fact that Ney acted in the negotiations in concert with Macdonald and Caulaincourt is sufficient proof of his desire to avert Napoleon's abdication. Less satisfactory was his loud protestation of devotion to the Bourbons, when the Restoration was a *fait accompli*. But he was mortified by the disdain of the returned *émigrés*, and retired to his country seat. While on his way to take up a command at Besançon, he heard of Napoleon's return. He hurried at once to assure Louis XVIII. of his fidelity. With the famous remark that the usurper ought to be brought to Paris in an iron cage, he proceeded to Lons-le-Saulnier to bar Napoleon's progress. But he deserted with his troops, and Napoleon's march became a triumphal progress. Ney's act was undeniably treason to his sovereign, but it was hardly the calculated treason that his *émigré* detractors saw fit to imagine. Napoleon received him kindly, but did not give him a command until just before the Waterloo campaign. The marshal took up the command of the left wing on the northern frontier on June 13. The next day the army moved into Belgium. Ney took part in the campaign successively in the rôles of strategist, tactician and soldier. (See WATERLOO CAMPAIGN.) Much controversy has raged over his actions of June 15 and 16. At Waterloo he was subordinated to the personal command of Napoleon, but his advice was often offered and sometimes accepted, and he personally led several charges of the French up to the British squares. But when all was lost, his courage was extinguished. He made no attempt to second Davout and Grouchy in the last days of Napoleon's reign, and in despair advocated the restoration of the Bourbons. Soon a fresh order was issued denouncing him by name, and he was arrested on Aug. 5. When Louis heard of Ney's arrest he exclaimed, "By letting himself be caught he has done us more harm than he did on the 13th of March!" But neither king nor ministers were in a position to resist the clamour of the ultra-royalists for blood. Every fresh delay in the process of Ney's trial raised a new outcry at the court, in the salons and in the Chamber of Deputies; and fiercest of all in demanding immediate execution was the king's niece, the unhappy duchess of Angoulême, who lived to confess that had she known the record of Ney's services to France she would never have consented to his death. Ney was placed on trial before a court martial composed chiefly of his former brothers-in-arms, whose participation in the tragedy was probably never forgiven them by their countrymen. Others of the marshal's old comrades refused to serve, and were disgraced in consequence, until public opinion forced their reinstatement. The court took advantage of the plea of Ney's counsel that he was entitled to be tried by his equals in the Chamber of Peers. In spite of the courageous and eloquent appeal of the young duc de Broglie, the result of the trial before the latter body was a foregone conclusion; de Broglie was alone in voting for his acquittal. In the early morning of Dec. 7, 1815, Ney was shot in the Luxembourg gardens, near the Observatory. He met his death quietly and with a perfect soldierly dignity.

Ney left materials for memoirs, but in an incomplete state. The

Mémoires du maréchal Ney, published in 1833, were collected from these papers by his brother-in-law Gamot and by General Foy. They cover only the earlier part of his career, and end with the battle of Elchingen (October 1805). An edition in English was published the same year.

Androix, *Ney* (1914).

NEZ PERCÉ, a tribe of Sahaptin lineage on Snake river in Idaho and Oregon, now on Lapwai reservation, Idaho. The estimated population was 6,000 in 1805, 1,400 in 1885, 1,500 in 1921. In 1877, under Chief Joseph, they fought the United States, winning some engagements and engaging in a notable but finally unsuccessful retreat almost to Canada. They were the largest and easternmost Sahaptin tribe and most affected by influences from the Plains Indians.

NGAMI, a shallow lake of variable size forming the centre of an inland drainage system in the Bechuanaland (*q.v.*) Protectorate, South Africa. The lake once extended to a length of 20 m. and a width of 10 m., but is now little more than an expanse of reeds growing in a soft soil, below which brackish water is found. It is cut by 20½° S. and 23° E. Ngami is the lowest point of a large depression in the great plateau of South Africa. The area which drains to it is bounded south by the basin of the Orange, east by the Matabele hills, north by the western affluents of the Zambezi. The greater part of the Ngami water-system lies, however, north-west of the lake in the Angola highlands. On the high plateau of Bihe, in the hinterland of Benguela, rise two large rivers, the Okavango and the Kwito, which uniting discharged their waters into Ngami. From the north-east end of Ngami issued the Botletle or Zuga, a stream which runs south-east and drains towards the Makarikari marsh, from which there is no outlet.

Although Ngami has contracted in size in modern times the Okavango and its tributary the Kwito remain large rivers. The Okavango is known in its upper course as the Kubango. Its most remote source lies in about 12½° S. and 16½° E. and its length is over 900 m. It flows first south then south-east and east. In about 18° S. and 20½° E. it is joined on the north bank by the Kwito, a large navigable stream rising almost as far north as the Okavango. Its general course is south-east, but between 15° and 17° S. it flows south and even south-west. Below the Kwito confluence the Okavango, which is also joined by various streams from the south-west, is a rapid stream, generally navigable as far as the Popa falls, in 21° 50' E. In the dry season, the water-level is from 4 to 20 ft. below the banks, but these are overflowed during the rains. At this period, April-June, some of the surplus water finds its way (in about 19° S.) by the Magwekwana to the Kwando or Linyanti (Zambezi system), to which, it is thought, the whole body of water may have once flowed. Below the Magwekwana outlet the Okavango, now called the Taukhe or Tioghe, turns almost due south, enters a swampy reed-covered plain and is broken into several branches. In this region the effects of desiccation are marked. Through the swamps the river formerly entered Ngami. Through the swamp some of the waters of the Okavango find their way eastward through a channel called Tamalakane to the Zuga or Botletle, the river which formerly flowed out of Ngami. The Botletle, whose bed is about 100 m. in length, loses itself in a system of salt-pans—round or oval basins of varying size sunk to a depth of 30 to 45 ft. in the sandstone, and often bounded by steep banks. The outer pans are dry for a large part of the year, the whole system being filled only at the height of the flood-season in August. The Botletle, which receives in addition the scanty waters of the northern Kalahari, at this season reaches the Makarikari marsh. In 1849 Livingstone found a large shallow lake. In 1896 Lugard and Passarge both found none. (See S. Passarge, *Die Kalahari*, 1904.)

NIAGARA, FORT, an American fortification, on the east side and at the mouth of Niagara river, opposite the Canadian village of Niagara-on-the-Lake. Ft. Niagara has a reservation of 288 ac., with fairly modern equipments, and several historic

buildings of the time of French and of British possession, in one of which, the old magazine (1757), William Morgan was imprisoned in 1826. Fort Niagara was long, especially during the French occupation of Canada, one of the most important forts in North America, being the key to the Great Lakes, beyond Lake Ontario. La Salle wintered here in 1678-9, built his ship the "Griffon," and established a trading post and Fort Conti, destroyed not long afterwards. Fort Denonville, built in 1687 by Jacques René de Brésey, marquis de Denonville, governor-general of Canada, in his cruel campaign against the Iroquois, was abandoned in 1688, after the garrison, commanded by Pierre de Troyes (d. 1687), had been wiped out by an epidemic. The first Fort Niagara, to be so named, was built in 1725-1727 at the instance of Charles le Moyne, 1st baron of Longueil (1656-1729), and became a very important military and trading post; the fort was rebuilt by François Pouchot (1712-1769) in 1756, but in July 1759, after a siege of about sixteen days, it was surrendered to Sir William Johnson by Pouchot. On the 14th of September 1763 a British force marching from Fort Schlosser (about 2 m. above the Falls; built 1761) to Fort Niagara was ambushed by Indians, who threw most of their captives into Devil's Hole, along the Niagara river. In July 1764 a treaty with the Indians was signed here, which detached some of them from Pontiac's conspiracy. Joseph Brant, John Butler and, in general, the Indians of north-western New York favouring the British during the Revolutionary War, made Fort Niagara their headquarters, whence they ravaged the frontier, and many loyalists and Indians took refuge here at the time of Gen. Sullivan's expedition into western New York in 1779. The fort was not surrendered to the United States until Aug. 1796. In the War of 1812 it was bombarded by the guns of Ft. George immediately across the river, and on Dec. 19, 1813 was surprised and taken by assault—most of the garrison being killed or taken prisoners—by British troops under John Murray. After the close of the war, on March 27, 1815, Ft. Niagara was restored to the United States, and a garrison was kept there until 1826. The fort was regarrisoned about 1836, and has since remained a post of the regular army.

NIAGARA FALLS (formerly Clifton or Suspension Bridge), a city and port of entry of Welland county, Ontario, Canada, 40 m. S.S.E. of Toronto, on the west bank of the Niagara river and opposite the Falls. Pop. (1921) 14,764. It is a station on the Canadian National and Michigan Central and St. Catharines and Niagara Central railways, and has electric railway communication with the chief towns in the neighbourhood. Three large steel bridges connect it with the American town of Niagara Falls on the opposite bank. Its importance was chiefly due to the tourist traffic, but the unrivalled water power is being more and more employed. Factories have sprung up and large electric power plants, and power is transmitted to Toronto and other cities. A beautiful park, named after Queen Victoria, extends along the bank of the river for $2\frac{1}{2}$ m. above the Falls.

NIAGARA FALLS, a city and a port of entry of Niagara county, New York, U.S.A., at the great falls of the Niagara river (q.v.) 22 m. N.N.W. of Buffalo. It is served by the Lehigh Valley, the Michigan Central, the New York Central, three electric railways and for freight also by the Erie and the Niagara Junction railways. Pop. (1920) 50,760 (35% foreign-born white); 1928 estimate 68,300. The city extends along the summit of the cliffs from above the falls (where the river makes a sharp curve) to 3 m. below them. Goat island separates the American fall (165 ft. high and 1,000 ft. wide) from the Horseshoe fall on the Canadian side (160 ft. high, with a crest of over 2,000 ft. in a deep curve), and between them is the delicate Bridal Veil. Below the falls the river rushes between perpendicular walls 300 ft. high, in a series of rapids to the whirlpool. Goat island, several smaller islands, and Prospect park (10 ac. on the brink of the gorge) have been a State reservation since 1885. Every evening (since 1925) the falls are illuminated with changing colours by 24 gigantic searchlamps

developing a total of 1,440,000,000 candle-power, set in Queen Victoria park across the river. Niagara Falls probably attract more visitors than any other single natural phenomenon of America. To protect their aesthetic value, the amount of water which may be diverted from either the Canadian or the American fall is limited by an international treaty. Practically all the permitted American diversion is now utilized in a hydro-electric development with an installation of over 500,000 h.p., serving half the population of the State. The city is an important manufacturing centre, especially of the electro-chemical industries, which are largely concentrated here. Others of importance are the manufacture of abrasives, shredded wheat, caustic soda, paper, aluminium, ferro-alloys and a great variety of chemical compounds. The aggregate factory output in 1925 was valued at \$108,479,229. Bank clearings in 1927 amounted to \$60,800,000. The assessed valuation of property was \$135,331,043. Since 1916 Niagara Falls has operated under a commission-manager form of government. It is the seat of Niagara university (Roman Catholic; 1856). Old Ft. Niagara (q.v.) 14 m. N., was in 1928 in process of restoration to its original condition.

A fort (Little Niagara) was built on the site of Niagara Falls in 1750, and after its destruction Ft. Schlosser was built in 1761. In 1806 Judge Porter founded the village of Manchester here, on the banks of the falls. It was burned by the British in 1813, and remained a straggling little settlement until the construction of the Hydraulic canal in 1852 and the subsequent development (especially after 1877) of power from the falls. The first bridge across the river was completed in 1835; the first railroad bridge (a suspension bridge by John A. Roebling) in 1855. In 1892 the villages of Manchester and Suspension Bridge were merged and chartered as the city of Niagara Falls, which in 1900 had a population of 19,457. Electric energy generated from the falls was first used for lighting Prospect park in 1879, and in 1881 power was sold for commercial use; but the great modern development dates from the World War, and the city's growth as a manufacturing centre has followed the development of the power resources. The falls have been the scene of many daring exploits, ever since Sam Patch in 1829 successfully leaped into the river twice, only to lose his life in a similar leap at the Genesee falls in Rochester. Several men and women have safely plunged over one or the other fall or through the whirlpool in barrels, and in 1859, and again in 1860 (on the occasion of the visit of Edward VII., then Prince of Wales) Blondin performed amazing feats on a tightrope stretched across the gorge.

NIAGARA RIVER flows in a northerly direction from Lake Erie to Lake Ontario, a distance of about 34 miles. It constitutes part of the boundary between the United States and Canada, separating the State of New York from the Province of Ontario. It is the principal drainage outlet of the four upper Great Lakes, whose aggregate basin area is about 248,500 sq. miles. Its discharges at standard low water and standard high water of Lake Erie (570 and 575.11 ft. above mean tide at New York) are about 153,000 and 267,000 second-feet, respectively. The river is navigable from its source to the upper rapids, 20 m., and from Lewiston to the mouth, 7 miles. The current is rapid for the upper navigable portion, where the average fall is about 0.5 ft. per mile. The total fall of the lower 7 m. is 0.5 foot. The intermediate section of the river, consisting of 7 m., includes a series of rapids and Niagara Falls, and has a total fall of 315 feet. The average width is about 3,500 feet.

Niagara Falls.—The falls of Niagara are justly celebrated for their grandeur and beauty, and are viewed every year by over 2,000,000 visitors. They are in two principal parts, separated by an island. The greater division, adjoining the left bank, is called the Horseshoe Fall; its height is 155 ft., and the length of its curving crest line is about 2,600 feet. The American Fall, adjoining the right bank, is 165 ft. high and about 1,400 ft. broad. The water is free from sediment, and its clearness contributes to the beauty of the cataract. In recognition of the importance of the waterfall as a great natural spectacle, the Province of Ontario and the State of New York have retained or acquired title to the adjacent lands and converted them into parks, which are main-

tained at public expense for the convenience of visitors.

The scenic grandeur of Niagara Falls depends upon the volume of water flowing over the falls, but also on its distribution as it approaches the crest. The statement that the Horseshoe Fall is in danger of destroying itself as a spectacle by cutting a narrow "notch," destroying the symmetry of the horseshoe, possibly degenerating into a cascade and eventually draining the American Falls, has unfortunately been widely circulated. The mean annual rate of recession of the crest at the central part of the Horseshoe has been determined as being about 5 ft. since 1764, 3.7 ft. since 1842 and 2.3 ft. per year since 1906. The Horseshoe is now cutting back at a decreasing rate and the rate will continue to decrease. The recession of the American Falls is negligible. By proper action, supervision and control by the two Governments concerned, the scenic beauty of the Falls can be preserved, the tendency toward erosion in the Horseshoe can be checked, water can be distributed over the at present bared flanks of the Canadian Fall and a more dependable flow over the American Fall ensured.

Geologic Age.—The problem of the river's age is of much interest to geologists, because its solution would aid in establishing a relation between the periods and ages of geologic time and the centuries of human chronology. The great Canadian glacier, which in the glacial period alternately crowded forward over the Great Lakes region and melted back again, so modified the face of the land by erosion and by the deposit of drift that the waters afterwards had to find new courses. The Niagara river came into existence when the waning of the glacier laid bare the western part of the Ontario basin, and the making of the gorge was then begun. If it were supposable that the lengthening of the gorge proceeded at a uniform rate, the computation of the time would be easy, but there are various modifying conditions. A weighing of the evidence now available indicates 25,000 years as a lower limit for plausible estimates of the age of the river, but yields no suggestion of an upper limit.

Navigation.—Between Lake Erie and Lake Ontario, navigation passes through the Canadian Welland canal. The old canal has 25 lift locks, with a total lift of 326½ feet. These locks are each 270 ft. long (usable length about 255 ft.) by 45 ft. wide, and were designed to have 14 ft. depth on the sills. The new Welland canal under construction by the Dominion of Canada in 1928, will admit the largest existing lake freighters. The southern portion of the new canal is chiefly an enlargement of the old canal. The northern portion follows a new location, entering Lake Ontario at Port Weller, about 3 m. east of the terminus of the old canal. The new canal will be 25 m. long, with a total lockage of 325½ feet. It will have 4 single locks, one flight of 3 double locks and 1 guard lock. The locks have a usable length of 820 ft., clear width 80 ft., and 30 ft. depth of water on the sill at lowest lake stages. All locks have a lift of about 46 feet. The gates are of the mitring type. The canal prism is 200 ft. wide at the bottom, 310 ft. wide at the water line, and from 25 to 26½ ft. deep at low water. All masonry structures are so designed as to allow an ultimate deepening to 30 ft. at low water. The estimated total cost of the canal is \$115,600,000. The construction of this canal was commenced in 1913; it was largely suspended during the World War, but later resumed, and it is now estimated the canal will be opened to navigation about 1930.

Water Diversion for Hydro-electric Power.—By treaty stipulation the amount of water that may be diverted from the Niagara river for power purposes has been limited to 36,000 cu.ft. per second on the Canadian side and 20,000 cu.ft. per second on the United States side. Of the Canadian diversion all but about 10,000 cu.ft. per second is used by the Hydroelectric Power Commission of Ontario, in three plants, the largest of which, near Queenstown, has a gross head of over 300 ft. and develops about 450,000 h.p. from the nine turbo-generators installed. Of the American diversion practically all the water is utilized by one concern with an installation of 560,000 horsepower. Three of the units of the latter company are rated at 70,000 h.p. each and are the largest hydro-electric units in existence. At all the plants electricity is generated at 11,000 volts, 25 cycles. Much is used in nearby electro-chemical industries for the manufacture of

aluminium, ferro-silicon, carborundum, artificial graphite, liquid chlorine, calcium carbide, cyanamide and other products. The remainder is transmitted to various cities for miscellaneous uses. The maximum distance to which this power is transmitted is somewhat in excess of 200 miles. (E. J.A.)

NIAM-NIAM: see AZANDE.

NIAS, largest of the chain of islands off the western coast of Sumatra, D.E. Indies. It is 80 m. long and nearly 30 wide, hilly, with coasts rocky or sandy, and landing is often dangerous: it is partly volcanic and earthquakes occur. There are three small rivers. Pop. 159,799. The islets Nako, Bunga, etc., near the north and west coasts are inhabited by a race which appears to be Indonesian in character and to have some affinity with the Bataks of Sumatra. Though intelligent, they have a reputation for treachery and thieving. They squander their means on feasting and ornaments, but are hospitable and have a high code of sexual morality, any infringement of which is severely punished. Marriage is exogamic and wives are bought. At death, wife and property pass to a man's brother. Land belongs to the settler and is inherited in the direct line. A council of notables assists hereditary chiefs in administration. Slave trade has been suppressed by the Dutch. Simple tattooing, teeth-filing and circumcision are practised. Weapons are carried and vendettas are common. Houses are built on piles, and sometimes are fortified with double walls. They have windows, a common room in the centre, and separate rooms for the various families which occupy one house, the entrance being through the floor, from underneath, in the house centre. Houses of chiefs are costly and have carved statues, or seats of wood, or stone, outside. The Niasese are pagans: human sacrifice on the death of a chief, also head-hunting, have been prohibited by the Dutch. Statues of the household gods are hung up in the houses, the phallic symbol is known, and in South Nias menhirs and large dissoliths exist. The funeral rites of an important person are celebrated by the sacrifice of pigs. There are good craftsmen in gold, silver, and wood, the coco-nut is cultivated and the oil traded with Malay and Achinese settlers, or taken to the Sumatran coast. Pigs are kept and form an important article of trade. Coal, of poor quality, iron, and copper have been found; gold is said to exist. Nias is administered by the residency of Tapanuli, in Sumatra, with an assistant resident at Gunung Situli, the chief town. It has no telegraphic or steamer communication with the mainland.

NIBELUNGENLIED, or DER NIBELUNGE NÖT, a mediaeval German heroic epic. The story on which it is based belongs to the general stock of Teutonic saga, and was very widespread under various forms, some of which are preserved. Thus it is touched upon in *Beowulf*, and fragments of it form the most important part of the northern *Eddas*, the poets of which evidently assumed that the tale as a whole was well known and that their hearers would be able to put each piece in its proper place. In the prose *Edda*, or *Volsungasaga*, which though largely primitive in spirit dates from the 13th century, it is set forth in full. The substance of this Norse version is as follows:—

"The three Anses—Odin, Loki and Hörnir—saw an otter devouring a salmon beside a waterfall. They killed and skinned the otter and, taking the skin with them, sought shelter for the night with Rodmar the giant. But Rodmar recognized the skin as that of his son, and demanded as *weregild* gold enough to cover it completely. Loki thereupon went back to the stream, where Andvari in the form of a pike was guarding a great treasure, caught him in a net, and forced him to surrender his hoard. But the piled-up gold left one hair exposed; in order to cover it Loki returned to Andvari and forced him to surrender a magic ring, which had the virtue of breeding gold. Thereupon Andvari, enraged, laid upon the hoard and all who should possess it a curse. This curse, the *Leitmotif* of the whole story, began to operate at once. Rodmar, for the sake of the treasure, was slain by his sons Fafnir and Regin; and Fafnir, seizing the whole, retired to a desolate heath and in the form of a snake or dragon brooded over the hoard. Regin, cheated of his share, plotted vengeance

and conquest of the treasure.

"To Regin, a notable smith, was sent Sigurd—son of the slain hero Sigmundr the Volsung and his wife Hiortis, now wife of the Danish king Alf—to be trained in his craft. To him Regin told of Fafnir and the hoard, and the young hero offered to go out against the dragon if Regin would weld him a sword. But every brand forged by the smith broke under Sigurd's stroke; till at last he fetched the fragments of the sword Gram, Odin's gift to his father, which Hiortis had carefully treasured. These Sigurd forged into a new sword, so hard that with it he could cleave the anvil, and so sharp that it would sever a flock of wool floating against it down stream; and, so armed, he sought and slew the dragon. But while roasting Fafnir's heart, which Regin had cut out, Sigurd burned his finger with the boiling fat and, placing it to his lips, found that he could understand the language of birds, and so learned from the chattering of the woodpeckers that Regin was planning treachery. Thereupon he slew the smith, and loading the treasure on the magic steed Grani, given to him by Odin, set out on his travels.

"On a fire-girt hill Sigurd found the Valkyrie Brunhild in an enchanted sleep, and ravished by her beauty awakened her; they plighted their troth to each other and, next morning, Sigurd left her to set out once more on his journey. Coming to the court of Giuki, a king in the Rhine country, Sigurd formed a friendship with his three sons, Gunnar, Hogni and Guthorm; and, in order to retain so valuable an ally, it was determined to arrange a match between him and their sister Gudrun. Queen Grimhild, skilled in magic, therefore gave him an enchanted drink, which caused him to forget Brunhild. Gunnar, on the other hand, wished to make Brunhild his wife, and asked Sigurd to ride with him on this quest, which he consented to do on condition of receiving Gudrun to wife. They set out; but Gunnar was unable to pass the circle of fire round Brunhild's abode, the achievement that was the condition of winning her hand. So Sigurd, assuming Gunnar's shape, rode through the flames on his magic horse, and in sign of troth exchanged rings with the Valkyrie, giving her the ring of Andvari. So Gunnar and Brunhild were wedded, and Sigurd, resuming his own form, rode back with them to Giuki's court, where the double marriage was celebrated. But Brunhild was moody and suspicious, remembering her troth with Sigurd and believing that he alone could have accomplished the quest.

"One day the two queens, while bathing in the river, fell to quarrelling as to which of their husbands was the greater. Brunhild taunted Gudrun with the fact that Sigurd was Gunnar's vassal, whereupon Gudrun retorted by telling her that it was not Gunnar but Sigurd who rode through the flames, and in proof of this held up Brunhild's ring which Sigurd had given to her. Brunhild, maddened by jealousy and wounded pride, now incited the three kings to murder Sigurd by exciting their jealousy of his power. The two elder, as bound to him by blood-brotherhood, refused; but the youngest, Guthorm, who had sworn no oaths, consented to do the deed. Twice he crept into Sigurd's chamber, but fled when he found the hero awake and gazing at him with flashing eyes. The third time, finding him asleep, he stabbed him; but Sigurd, before he died, had just strength enough to hurl his sword at the murderer, whom it cut in two. Brunhild, when she heard Gudrun wailing, laughed aloud. But her love for Sigurd was great as ever, and she determined not to survive him; distributing her wealth to her hand-maidens she mounted Sigurd's funeral pyre, slew herself with his sword, and was burnt with him.

"In course of time Gudrun married Atli (Attila), king of the Huns, Brunhild's brother. Atli, intent on getting hold of the hoard which Gudrun's brothers had seized, invited them to come to his court. In spite of their sister's warnings they came, after sinking the treasure in the Rhine. On their refusal to surrender the hoard or to say where it was concealed, a fierce fight broke out in which all the followers of Gunnar and Hogni fell. Atli then once more offered to spare Gunnar's life if he would reveal his secret; but Gunnar refused to do so until he should see the heart of Hogni. So Hogni's heart was cut out, the victim laughing while; but when Gunnar saw it he cried out that now he alone knew where the hoard was and that he would never reveal

the secret. His hands were then bound, and he was cast into a den of venomous serpents; but he played so sweetly on the harp with his toes that he charmed the reptiles, except one adder, by which he was stung to death. Gudrun, however, avenged the death of her brothers by slaying the sons she had borne to Atli and causing him unwittingly to drink their blood and eat their hearts. Finally, in the night, she killed Atli himself and burned his hall; then, leaping into the sea, she was carried by the waves to new scenes, where she had adventures not connected with those recorded in the *Nibelungenlied*."

This story, in spite of the late date of the *Volsungasaga*, represents a very primitive version. The setting of the *Nibelungen* story, on the other hand, is mediaeval rather than primitive, though its extant versions are of much earlier date, and it contains primitive elements not found in the other. Everywhere the supernatural elements are eliminated or subordinated. The gods have vanished from the scene; there is nothing of Loki and his theft of Andvar's hoard, nothing of Odin and his gifts of the sword Gram, and the magic horse Grani; and not till the third *Aventiure*, when Siegfried comes to Worms, are we given even a hint that such things as the sword and treasure exist.

In the legend of Sigurd the Volsung, the plot had turned upon the love and vengeance of Brunhild, so in the song of the *Nibelungs* it is the love and vengeance of Kriemhild, the Gudrun of the northern saga, that forms the backbone of the story and gives it from first to last an artistic unity which the *Volsungasaga* lacks. The tragedy of the close of the story is emphasized by the pomp and circumstance that surround the ill-fated hero. The primitive setting of the northern version has vanished utterly. Sigmund is king of the Netherlands; the boy Siegfried is brought up by "wise men that are his tutors" (*Avent. ii.*); and when, attracted by the fame of Kriemhild's beauty, he rides to Worms to woo her, it is as the typical handsome, accomplished and chivalrous king's son of mediaeval romance.

It is at this point (*Avent. iv.*) that some primitive elements are suddenly and awkwardly introduced. As Siegfried approaches Worms, Kriemhild's brothers, the Burgundian kings Gunther, Giselhâr and Gêrnot watch his coming, and to them their faithful retainer, "the grim Hagen," explains who he is. This can be no other than the hero who slew the two kings of the *Nibelungs*, Schilbunc and Nibelunc, and seized their treasure, together with the sword Balmunc and the *tarnkappe*, or cape of darkness, which has the virtue of making him who wears it invisible. Another adventure, too, he can tell of him, namely, how he slew a dragon and how by bathing in its blood his skin became horny, so that no weapon could wound him save in one place, where a linden leaf had fallen upon him as he stooped, so that the blood did not touch this spot. In spite of Hagen's distrust and misgivings, Siegfried now fights as the ally of the Burgundians against the Saxons (*Avent. iv.*), and undertakes, on condition of receiving Kriemhild to wife, to help Gunther to woo Queen Brunhild, who can only be won by the man who can overcome her in three trials of strength (*Avent. vi.*). Siegfried and Gunther accordingly go together to Brunhild's castle of Isenstein in Iceland, and there the hero, invisible in his *tarnkappe*, stands beside Gunther, hurling the spear and putting the weight for him, and even leaping, with Gunther in his arms, far beyond the utmost limit that Brunhild can reach (*Avent. vii.*). Brunhild confesses herself beaten and returns with the others to Worms, where the double marriage is celebrated with great pomp (*Avent. x.*). But Brunhild is ill content; though she saw Siegfried do homage to Gunther at Isenstein she is not convinced, and believes that Siegfried should have been her husband; and on the bridal night she vents her ill humour on the hapless Gunther by tying him up in a knot and hanging him on the wall. "I have brought the evil devil to my house!" he complains to Siegfried next morning; and once more the hero has to intervene; invisible in his *tarnkappe* he wrestles with Brunhild and, after a desperate struggle, takes from her her girdle and ring before yielding place to Gunther. The girdle and ring he gives to his wife Kriemhild (*Avent. x.*).

One day, while Siegfried and his wife were on a visit to the Burgundian court, the two queens fell to quarrelling on the ques-

tion of precedence, not in a river but on the steps of the cathedral (*Avent.* xiv.). Kriemhild was taunted with being the wife of Gunther's vassal; whereupon, in wrath, she showed Brunhild the ring and the golden girdle taken by Siegfried, proof that Siegfried, not Gunther, had won Brunhild. So far the story is essentially the same as that in the *Volsungasaga*; but now the plot changes. Brunhild drops out, becoming a figure altogether subordinate and shadowy. The death of Siegfried is compassed, not by her, but by the "grim" Hagen, Gunther's faithful henchman, who thinks the glory of his master unduly overshadowed by that of his vassal. Hagen easily persuades the weak Gunther that the supposed insult to his honour can only be wiped out in Siegfried's blood; he worms the secret of the hero's vulnerable spot out of Kriemhild on pretence of shielding him from harm (*Avent.* xv.) and then arranges a great hunt in the forest, so that he may slay him when off his guard. The 16th *Aventiure* describing this hunt and the murder of Siegfried is perhaps the most powerful scene in all mediaeval epic. When the hunters sat down to feast, it was found that the wine had been forgotten. Hagen thereupon proposed that they should race to a spring some way off in the forest. Siegfried readily agreed, and though handicapped by carrying shield, sword and spear, easily reached the goal first, but waited, with his customary courtesy, until the king had arrived and drunk before slaking his own thirst. Then, laying aside his arms, he stooped and drank. Hagen, seizing the spear, thrust it through the spot marked by Kriemhild on Siegfried's surcoat. The hero sprang up and, finding that his sword had been removed, attacked Hagen with his shield.

Then reproaching them for their cowardice and treachery, Siegfried fell dying "amid the flowers" while the knights gathered round lamenting. The whole spirit of this scene is primitive Teutonic rather than mediaeval. The same is true, indeed, of the whole of the rest of the poem. Siegfried, to be sure, is buried with Catholic rites; but Kriemhild, while praying for his soul like a good Christian, plots horrible vengeance like her pagan prototype. Mistress now of the Nibelungen hoard, she sought to win a following by lavish largesses; but this Hagen frustrated by seizing the treasure, with the consent of the kings, and sinking it in the Rhine, all taking an oath never to reveal its hiding-place (*Avent.* xix.). At last, however, after 13 years, Kriemhild's chance came, with a proposal of marriage from Etzel (Attila) king of the Huns, which she accepted on condition that he would help her to vengeance (*Avent.* xx.). Then more years passed; old feuds seemed to be forgotten; and the Burgundian kings, in spite of Hagen's warnings, accepted their sister's invitation to visit her court (*Avent.* xxiii.-xxiv.).

The journey of the Burgundians into Hunland is described by the poet at great length (*Avent.* xxv.-xxvii.). From this point onward the story is dominated by the figure of the grim Hagen, who, twitted with cowardice and his advice spurned, is determined that there shall be no turning back and that they shall go through with it to the bitter end. With his own hands he ferries the host over the Danube and then destroys the boat, so that there may be no return. At Attila's court (*Avent.* xxviii.) it is again Hagen who provokes the catastrophe by taunting Kriemhild when she asks him if he has brought with him the hoard of the Nibelungen:

"The devil's what I bring you!" Hagen then replied,
"What with this heavy harness and my shield beside,
I had enough to carry; this helmet bright I brought;
My sword is in my right hand, and that, be sure, I bring you not!"

The sword was Siegfried's. It is Hagen, too, who after the first onslaught of the Huns, strikes off the head of Ortlieb, the son of Etzel and Kriemhild, and who, amid the smoke and carnage of the burning hall, bids the Burgundians drink blood if they are thirsty.

But for all their prowess, after a prolonged struggle (*Avent.* xxix.-xxxvii.) the Burgundians were at last overwhelmed. Most of the chief figures of heroic saga had come up against them; Attila, Hildebrand, the Ostrogoth Theodoric (Dietrich von Bern). To the last named even Hagen armed with Siegfried's sword had to yield (*Avent.* xxxviii.). Kriemhild came to him as he lay in bonds and demanded the Nibelung treasure. He refused to reveal

its hiding place so long as Gunther, also a prisoner, should live. Gunther was accordingly slain by the queen's orders and his head was brought to Hagen, who cried out when he saw it that all had been accomplished as he had foretold:

"Now none knows where the hoard is save God and I alone:
That to thee, devil-woman, shall nevermore be known!"

Whereupon Kriemhild slew him with Siegfried's sword. But Kriemhild was not destined, like Gudrun, to set out on further adventures. Hildebrand, horrified at her deed, sprang forward and cut her to pieces with his sword.

In sorrow now was ended the king's high holiday,
As ever joy in sorrow ends and must end alway.

To some mss. of the *Nibelungenlied* is added a supplementary poem called the *Klage* or *Lament*, a sequel of 2,160 short-line couplets, describing the lament of the survivors—notably Etzel—over the slain, the burying of the dead, and the carrying of the news to the countries of the Burgundians and others. At the end it is stated that the story was written down, at the command of Bishop Pilgrim of Passau, by a writer named Konrad (Kunrât) in Latin and that it had since been sung (*getichtet*) often in the German tongue.

Sources of the Story.—The origin and nature of the various elements that go to make up the story of the *Nibelungenlied* have been, and continue to be, the subject of debate. The view at one time most generally accepted was that first propounded by Karl Lachmann in his "Kritik der Sage von den Nibelungen" (*Rheinisches Museum für Philologie*, num. 249, 250, 1829, republished in his *Zu den Nibelungen . . . Anmerkungen* in 1836), namely that the story was originally a myth of the northern gods modified into a heroic saga after the introduction of Christianity, and intermingled with historical elements. This view was also maintained by Richard von Muth in his *Einleitung in das Nibelungenlied* (Paderborn, 1877). On the other hand, so early as 1783 Johannes von Müller of Göttingen had called attention to the historical figures appearing in the Nibelungenlied, identifying Etzel as Attila, Dietrich of Bern as Theodoric of Verona, and the Burgundian kings Gunther, Giselhâr and Gernot as the Gundaharius, Gislarius and Godomar of the *Lex Burgundiorum*; in 1820, Julius Liechten (*Neuaufgefundenes Bruchstück des Nibelungenliedes*, Freiburg-im-Breisgau) roundly declared that "the *Nibelungenlied* rests entirely on a historical foundation, and that any other attempt to explain it must fail." This view was, however, overborne by the great authority of Lachmann, whose theory, in complete harmony with the principles popularized by the brothers Grimm, was accepted by a long series of critics. In later years criticism tended to revert to the standpoint of Müller and Leichten and to recognize in the story of the Nibelungen a misty and confused tradition of real events and people. Mythical elements it certainly contains; and to those figures which—like Siegfried, Brunhild, or Hagen—cannot be traced to historical originals, a mythical origin is still provisionally ascribed, though Theodor Abelung (*Das Nibelungenlied*, 1907) made out a plausible case for identifying Siegfried with Segerio, son of the Burgundian king Sigimund and Brunhild with the historical Brunichildis.

The basis of the story is then, according to this view, historical, not mythical; a medley of Franco-Burgundian historical traditions, overlaid with mythical fancies. The historical nucleus is the overthrow of the Burgundian kingdom of Gundahar by the Huns in 436; and round this there gathered an accretion of other episodes, equally historical in their origin, however distorted, with a naïve disregard of chronological possibility. In the *Eddas* the identity of the original Franco-Burgundian sagas is fairly preserved. In the *Nibelungenlied*, on the other hand, the influence of other wholly unconnected stories is felt: thus Hildebrand appears during the final fight at Etzel's court, and Theodoric the Great (Dietrich von Bern; see THEODORIC).

Origin of the Poem.—The controversy as to the underlying elements of the Nibelung legend extends to the question of the authorship and construction of the poem itself. Was it from the first—whatever additions and interpolations may have followed—conceived as a single, coherent story, or is it based on a number

of separate stories, popular ballads akin to the *Eddas*, which the original author of the *Nibelungenlied* merely collected and strung together? The answer to these questions has been sought by a succession of scholars in a critical comparison of the mediæval mss. of the poem still surviving. Of these 33 are now known, of which ten are complete, the rest being more or less fragmentary. The most important are those first discovered, viz., the mss. lettered C (Hohenems 1755), B (Schloss Werdenberg, 1769), A (Hohenems 1779); and round these the others more or less group themselves. They exhibit many differences: put briefly C is the most perfectly finished in language and rhythm; A is rough, in places barbarous; B stands half-way between the two. Which is nearest to the original? Karl Lachmann (*Zu den Nibelungen und zur Klage, Anmerkungen*, 1836) decided in favour of A. He applied to the *Nibelungenlied* the method which Friedrich August Wolf had used to resolve the *Iliad* and *Odyssey* into their elements. The poem, according to Lachmann, was based on some 20 popular ballads, originally handed down orally, but written down about 1190 or 1200. This original is lost, and A—as its roughness of form shows—is nearest to it; all other mss. including B and C are expansions of A. Lachmann's view was first seriously assailed by Adolf Holtzmann (*Untersuchungen über das Nib.*, Stuttgart, 1854), who argued that the original could not have been strophic in form—the fourth lines of the strophes are certainly often of the nature of "padding"—that it was written by Konrad (Kunrât of the *Klage*) writer to Bishop Pilgrim of Passau about 970–984, and that of existing mss. C is nearest to this original, B the copy of a ms. closely akin to C, and A an abbreviated corrupt copy of B. This view was adopted by Friedrich Zarncke, who made C the basis of his edition of the *Nibelungenlied* (Leipzig, 1856). A new hypothesis was developed by Karl Bartsch in his *Untersuchungen über das Nibelungenlied* (Leipzig, 1865). According to this the original was an assonance poem of the 12th century, which was changed between 1190 and 1200 by two separate poets into two versions, in which pure rhymes were substituted for the earlier assonances; the originals of the *Nibelungenlied* and *Der Nibelunge Nôt* respectively. Bartsch's subsequent edition of the *Nibelunge Nôt* (1st ed., Leipzig, 1870) was founded on B, as the nearest to the original. To this view Zarncke was so far converted that in the 1887 edition of his *Nibelungenlied* he admitted that C shows signs of recension and that the B group is purer in certain details.

It is impossible here to follow the further developments of the question. Theodor Abelung's *Das Nibelungenlied und seine Literatur* gives a very full bibliography from 1756 to 1905. Other important contributions since are: Andreas Heusler, in the *Sitzungsberichte der Königl. Preuss. Akad. der Wissenschaften*, xlvii. (1914), in which he investigates anew the genesis of the saga; Hermann Fischer, *Über die Entstehung des Nibelungenliedes*, in *Sitzungsber der Königl. Bayer. Akad. der Wiss., Philos. und hist. Klasse*, 1914, who traces the various influences at work on the poem and concludes that it was written under that of Bishop Wolfger of Passau. With this Friedrich Wilhelm (in *Müncher Archiv*, part 7, 1916) is in agreement. There have also been during latter years advocates of a Latin original of the poem; e.g., R. Pestalozzi, *Die Nibelungias* (*Neue Jahrbücher*, 39, 1916–17), but this idea is generally discredited.

There are English translations of the poem by A. G. Foster-Barham (1887) and Margaret Armour (prose, 1897); and Alice Horton (1898). (W. A. P.)

NICAËA or NICE (mod. *İznik*, i.e., *ἐς Νικαίαν*), an ancient town of Asia Minor, in Bithynia, on the Lake Ascania. Antigonus built the city (316 B.C.?) on an old deserted site, and soon afterwards Lysimachus changed its name from Antigonía to Nicaea, calling it after his wife. Under the Roman empire Nicaea and Nicomedia disputed the title of metropolis of Bithynia. Strabo describes the ancient Nicaea as built regularly, in the form of a square, with a gate in the middle of each side. From a monument in the centre of the city all the four gates were visible at the extremities of great cross-streets. After Constantinople became the capital of the empire Nicaea grew in importance, and after the conquest of Constantinople by the Crusaders became the temporary seat of the Byzantine emperor; the double line of

walls with the Roman gates is still well preserved. The possession of the city was long disputed between the Greeks and the Turks. It remained an important city for some time after its final incorporation in the Ottoman empire; but became subsequently an insignificant village.

NICAËA, COUNCIL OF. The Council of Nicaea (A.D. 325) is an event of the highest importance in the history of Christianity. Its convocation by Constantine and its course illustrate the radical revolution which the position of this religion, within the confines of the Roman empire, had undergone in consequence of the Edict of Milan. From his accession Constantine had shown himself the friend of the Christians; and, when his victory over Licinius (A.D. 323) gave him undisputed possession of the crown, he adhered to this religious policy, distinguishing and fortifying the Christian cause by gratuities and grants of privilege. This propitiatory attitude originated in the fact that he recognized Christianity—which had successfully braved so many persecutions—as the most vital and vigorous of religions, and as the power of the future. Consequently he directed his energies toward the establishment of a positive relationship between it and the Roman state. But the Church could only maintain its great value for the politician by remaining the same compact organism which it had proved itself to be under the stormy reign of Diocletian. Scarcely, however, did it find itself in the enjoyment of peaceful relations with the state, when violent feuds broke out in its midst, whose extent, and the virulence with which they were waged, threatened to dismember the whole religious body. Donatism in the West was followed by the Arian struggle in the East. The former movement had been successfully arrested, though it survived in North Africa till the 5th century. The conflict kindled by the Alexandrian presbyter Arius with regard to the relation of Christ to God assumed a more formidable character (see *ARIUS*). Constantine therefore had recourse to an institution previously evolved by the Christian Church—the convocation of a synod to pronounce on burning questions—enlarging it, however, to correspond with the altered circumstances. He convened a council, designed to represent the whole Church of the empire, at Nicaea in Bithynia, a town situated no great way from the imperial summer-residence of Nicomedia and within easy reach by sea of the Oriental bishops. In consequence of the vast distances, the West was not largely represented, but the able theologian Hosius, bishop of Cordova, was present. The three most important bishoprics of the East were represented (Alexandria, Antioch, and Jerusalem); a prominent part was also taken by Eusebius, bishop of Nicomedia, and his namesake of Caesarea (the historian), along with a very large number of others from the east. Among the attendant clergy, the still youthful deacon Athanasius, destined to succeed Alexander in the see of Alexandria, was prominent as the most powerful antagonist of Arianism (see *ATHANASIUS*). The synod sat from May 20 to July 25.

The deliberations on the Arian question passed through several distinct stages before the final condemnation of Arius and his doctrines was reached. A clearly defined standpoint with regard to this problem—the relationship of Christ to God—was held only by the comparatively small group of Arians and a not much larger group who adhered with unshaken conviction to the Alexandrian view. The bulk of the members occupied a position between these two extremes. They rejected the formulae of Arius, and declined to accept those of his opponents; that is to say, they were merely competent to establish negations, but lacked the capacity, as yet, to give their attitude of compromise a positive expression. That the majority of the council should have adopted this neutral tendency is easily intelligible when we consider the state of theology at that period. True, at Nicaea this majority eventually acquiesced in the ruling of the Alexandrians; yet this result was due, not to internal conviction, but partly to indifference, partly to the pressure of the imperial will—a fact which is mainly demonstrated by the subsequent history of the Arian conflicts. For if the Nicaean synod had arrived at its final decision by the conscientious agreement of all non-Arians, then the confession of faith there formulated might indeed have evoked the continued antagonism of the Arians, but must necessarily have

been championed by all else. This, however, was not the case; in fact, the creed was assailed by those very bodies which had composed the *laissez-faire* centre at Nicaea; and we are compelled to the conclusion that, in this point, the voting was no criterion of the inward convictions of the council.

In the synod, an Arian confession of faith was first brought forward and read; but it aroused such a storm of indignation that obviously, in the interests of a restoration of ecclesiastical peace, there could be no question of its acceptance. On this, Eusebius of Caesarea submitted the baptismal creed of his community. Since the creed dated from a period anterior to the outbreak of the Arian struggle, its reception would have been equivalent to a declaration on the part of the council that it declined to define its position with reference to the controversy of the hour. That the greater number of delegates were not disinclined to adopt this subterfuge, and to shelve the actual solution of the whole problems by recognition of this or some similar neutral formula, is extremely probable. But the emperor saw that, if the difficulties were eluded in any such way, it was inevitable from the very nature of the case, that they should rise again in an accentuated form, and that consequently no pacification could be expected from this policy.

Accordingly Constantine proposed that the Caesarean creed should be modified by the insertion of the Alexandrian passwords (including the decisive term *ὁμοούσιος*, "identical in nature"), as if for the purpose of more accurate definition, and by the deletion of certain portions. That he appreciated the import of these alterations, or realized that this revision was virtually the proclamation of a new doctrine, is scarcely probable. The creed thus evolved by an artificial unity was no ratification of peace: in fact, it paved the way for a struggle which convulsed the whole empire. For it was the proclamation of the Nicene Creed that first opened the eyes of many bishops to the significance of the problem there treated; and its explanation led the Church to force herself, by an arduous path of theological work, into compliance with those principles, enunciated at Nicaea, to which, in the year 325, she had pledged herself without genuine assent.

BIBLIOGRAPHY.—See the Histories of Dogma by Harnack, Loofs and Seeberg; articles in Hastings, *Encyclopaedia of Religion and Ethics* and Herzog-Hauck, *Realencyclopädie*, 3rd ed.; Bethune-Baker, *Introduction to the early History of Christian Doctrine*; Gore, *Dissertations on Subjects connected with the Incarnation*; and (from another point of view) Mellone, "Athanasius the Modernist" in *The Price of Progress* (1924). In addition to the Arian problem, the council dealt with the question of the "lapsed" in the recent persecution, the question of "heretical baptism" and other matters (see Helele, *History of Councils*, vol. i.).

NICANDER (2nd cent. B.C.), Greek poet, physician and grammarian, was born at Claros, near Colophon, where his family held the hereditary priesthood of Apollo. He flourished under Attalus III. of Pergamum. He wrote a number of works both in prose and verse, of which two are preserved. The longest, *Theriaca*, is an hexameter poem (958 lines) on the nature of venomous animals and the wounds which they inflict. The other, *Alexipharmaca*, consists of 630 hexameters treating of poisons and their antidotes. In his facts Nicander followed the physician Apollodorus. Among his lost works may be mentioned: *Aetolica*, a prose history of Aetolia; *Heteroeumena*, a mythological epic, used by Ovid in the *Metamorphoses* and epitomized by Antoninus Liberalis; *Georgica* and *Melissourgica*, of which considerable fragments are preserved, said to have been imitated by Virgil (Quintilian x. i. 56).

Editions by J. G. Schneider (1792, 1816); O. Schneider (1856) (with the Scholia); H. Klausner, "De Dicendi Genere . . . Nicandri" (*Dissertationes Philologicae Vindobonenses*, vi. 1898). The Scholia (from the Göttingen ms.) have been edited by G. Wentzel in *Abhandlungen der k. Gesellschaft der Wiss. zu Göttingen*, xxxviii. (1892). See also W. Vollgraf, *Nikander und Ovid* (Groningen, 1909 seq.).

NICARAGUA, the largest country of Central America, lying between Honduras and Costa Rica, which form its north and south boundaries, respectively, and reaching from the Caribbean sea on the east to the Pacific ocean on the west. Its area, which is still undetermined owing to boundary disputes with Honduras and incomplete surveys, is generally put at from 49,200 to 51,660 sq.m., the former being the most generally accepted. Pop. (1920

census) 638,118, 13 to the square mile. The coast line is about 300 m. on the Caribbean and 200 m. on the Pacific. The Honduran boundary as generally accepted starts at Cape Gracias a Dios, follows the Segovia river inland and then at 86° W. takes an imaginary line to the upper waters of the Río Negro, which it follows to the Gulf of Fonseca. The Costa Rican boundary is now agreed upon, under treaties of 1858, confirmed in 1888 and settled in 1896, to be a line 2 m. S. of the San Juan river and Lake Nicaragua.

Physical Features.—Nicaragua is crossed by the two mountain chains that traverse the Western Hemisphere, and which provide some fine highland valleys. Its most striking natural features, however, are the two great lakes, Lake Nicaragua, about 100 m. long and 45 m. wide, and Lake Managua, to the north of it, and connected with it by the Tipitapa river. Lake Managua's length is 38 m. and its width varies from 10 to 16 miles.

The coasts of Nicaragua are strikingly different in configuration. The low, swampy and monotonous shore of the Caribbean, with its numerous lagoons and estuaries, and its fringe of reefs and islets, contains only three harbours: Gracias a Dios, Bluefields and Greytown (San Juan del Norte). The Pacific coast is bold, rocky and unbroken by any great indentation; here, however, are the best harbours of the republic—the southern arm of the Bay of Fonseca (q.v.), Corinto, Brito and San Juan del Sur.

The surface of the country is naturally divided into five clearly distinct zones: (1) the series of volcanic peaks which extend parallel to the Pacific at a little distance inland; (2) the plains and lakes of the great depression which lies to the east of these mountains and stretches from sea to sea, between the Bay of Fonseca and the mouths of the San Juan; (3) the main cordillera, which skirts the depression on the east, and trends north-west from Monkey Point or Punta Mico on the Caribbean sea, until it is merged in the ramifications of the Honduran and Salvadorian highlands; (4) the plateaux which slope gradually away from the main cordillera towards the Caribbean; (5) the east or Mosquito coast (q.v.), with its low-lying hinterland. The chain of volcanic cones, which constitutes a watershed quite equal in importance to the cordillera itself, consists for the most part of isolated igneous peaks, sometimes connected by low intervening ridges.

The main Nicaraguan cordillera, which flanks the depression on the east, has often been called the Cordillera de los Andes, from

SCENE IN A JUNGLE SWAMP OF THE LOW COAST-LAND OF NICARAGUA

its supposed continuity with the mountain-chains of Panama and the west coast of South America. There is in fact no such continuity, for the San Juan valley completely separates the mountains of Panama from the main Nicaraguan system. The main cordillera bears different names in different parts of Nicaragua. Thus the important section which terminates at Monkey Point is commonly called the Cordillera de Yolaina. The summits of the main cordillera seem nowhere to exceed 7,000 ft. in altitude; the mean elevation is probably less than 2,000 ft.; the declivity is sheer towards the lakes, and gradual towards the Caribbean. On

the east, the cordillera abuts upon the region of plateaux and savannas, which occupies nearly half of the area of Nicaragua.

Climate.—The climate along the coasts, where most of the population lives, is hot and often sultry; in the highland sections there is the usual relatively cool and even climate of the tropical upland. There are two seasons, wet and dry, the former extending from May or June to November or December and dry in the remaining period, although on the east coast, the rainy season often extends well into the so-called dry period. Rainfall varies in different sections, as much as 297 in. a year having been recorded at Bluefields, on the Caribbean coast; the mean at Rivas, on the Pacific side, is 102 in. a year.

Inhabitants.—The census of 1882 placed the population of Nicaragua at 275,816; in 1890, it was 375,000; in 1900, 500,000; in 1905, 550,000; in 1920, as noted, the census reported 638,118. None of these tabulations is entirely accurate, as the difficulties of census-taking entail costs which the Nicaraguan Government has wisely deemed greater than the advantages. The population is increasing, however, and in approximately the rate shown by the various censuses recorded. The overwhelming proportion of the population is of mixed Indian and Spanish blood, the pure Indians being estimated at 30,000 and those of white descent, purely, at about the same number; foreigners and their descendants number about 2,000, according to local estimates.

Political Organization.—The present Constitution of Nicaragua was proclaimed in Dec. 1911, superseding those of 1905 and 1894. The legislative power is now vested in a congress composed of two chambers, senate and chamber of deputies (under the previous Constitution there was but one chamber). The country is divided into departments, to be fixed by law, representation in congress being from the departments, on the basis of one deputy for every 15,000 inhabitants, and one senator to each two deputies; deputies are elected for four and senators for six years, each having an alternate, elected at the same time, who succeeds him in case of disability. The executive power is vested in the president, elected by popular vote for a four-year term; he must be over 30 years of age and a native citizen of Nicaragua: a vice president is chosen at the same time, to succeed the president in case of death or disability. In case the vice president is eliminated, the senate elects a "designate," who assumes the office of president under the same circumstances as the vice president. The presidential cabinet consists of six ministers, appointed by the president, these being ministers of government and police, foreign relations, public instruction, treasury and public credit, war and marine, promotion (*fomento*), justice and public works. The judiciary is exercised by a supreme court of justice with five members, three courts of appeal and inferior courts. Congress elects justices of the supreme court for six years, and of the courts of appeals for four years.

Education and Religion.—Illiteracy in Nicaragua is estimated at 50%, but the Government, in co-operation with the Roman Catholic Church (which has been close to the conservative political group which ruled Nicaragua from 1912 to 1928), has made definite efforts to reduce this and make education more general. In 1927 there were 402 State elementary schools, with 788 teachers and 24,800 pupils; three State secondary schools, with 37 teachers and 260 pupils; five professional schools with 219 pupils; 3 normal schools with 35 teachers and 2,500 students. There are also 79 private schools with 5,557 pupils; this includes some but not all of the parochial schools. There are three universities—at Managua, León and Granada. The Roman Catholic Church is powerful in Nicaragua, with an archbishop at Managua and bishops at Granada, León and Matagalpa, but religious tolerance is provided under the Constitution.

Finances.—Nicaragua has been under foreign supervision in financial matters since 1912, and despite the costly and destructive revolution of 1926-27, its finances, internal and external, have continued excellent. The foreign debt, of 1909, originally £1,250,000, has been reduced to (March 31, 1928) £677,400, with all arrears of interest paid and the debt on a 5% basis, to which it was reduced by agreement with the British bond-

holders on the inauguration of the American-supervised collector-generalship of customs, in 1912. There is also outstanding 2,372,000 *córdobas* (the *córdoba* is equal in value to the American dollar and is designated C\$) of the guaranteed customs bonds, issued in payment of war and revolutionary claims up to 1912. There were, at the end of 1928, some C\$17,000,000 of claims for damages and other revolutionary debts, which have still to be settled, and there is likelihood of a new loan of approximately C\$12,000,000, to refund the remainder of the 1909 issue, to pay damage claims (estimated as capable of settlement for C\$2,000,000 in cash) and to furnish some funds for starting work on a railway or highway to join the east and west coasts of the country.

The financial history of Nicaragua is made up of the usual list of loans and defaults characteristic of Central American countries. In 1912 following difficulties with President José Santos Zelaya, the loan of 1909 went into default, and as a result of this and the concomitant political developments, the so-called Financial Plan of 1912 was put into effect. This plan provided for the installation of an American collector-general of customs, and a rearrangement of Nicaraguan finances generally under the supervision of American bankers. When the interest and sinking fund, with arrears, was satisfactorily arranged, the Council of Foreign Bondholders of London accepted a reduction in the rate of interest, from 6 to 5%. In 1917, another financial plan was adopted, bringing up to date the payments on the foreign debt, which had been suspended owing to financial difficulties incident to the war. In that year Nicaragua received from the United States \$3,000,000 in payment for an option to the site and defences of any proposed Nicaraguan interoceanic canal; this money was applied to the settlement of old war claims and arrears of interest on the debt. Under the Financial Plan of 1917, a high commission, with one resident American member, was installed to handle the Guaranteed Customs Bonds issued to take care of the balance of war damage claims awarded by a mixed commission.

The National Bank of Nicaragua was founded under the Financial Plan of 1917, with the New York bankers in control, but the Nicaraguan Government holding 49% of the stock; the bank was operated by the Bank of Central and South America, New York, now dissolved. At the time (1925) that the interests of the Bank of Central and South America were transferred, so far as Latin American branches were concerned, to the Royal Bank of Canada, the Bank of Nicaragua was sold to the Nicaraguan Government; American management was retained, however, and the Government elected as directors, in New York, the men from the interested banks who had been in charge previously. This bank was given full power to issue currency in the form of bank notes, with the new unit of currency, the *córdoba*, equal to the American dollar.

Defence.—Nicaragua has been virtually without an army since 1912, when American marines were first landed, to remain 13 years, and furnished ample defence to the Government from enemies within and without. A small guard was maintained at the capital, largely for parade purposes. When the marines were withdrawn on Aug. 3, 1925, a National Guard had been designed, but was organized only with difficulty by former American army officers employed by the Nicaraguan Government. Following the return of the American marines in 1927, the guard was organized on a new basis, with active American army officers and non-commissioned officers detailed to the work. The Guardia Nacional numbered (1929) between 2,000 and 2,500 men and is used as both police and military; the American marine guard continues in the country.

Economics and Trade.—Nicaragua is prosperous when the coffee crop is good and the world prices high; other factors in its economic life are dependent almost alone on the political and financial situation. The coffee crop in 1927, owing to revolutionary disturbances and somewhat lowered world prices, was the lowest since 1923, a year of low prices throughout the world. Coffee, even in 1927, amounted to about 45% of the total exports. The figures of imports and exports for the five years 1923-27 are

as follows:—

Year	Imports	Exports
1923	C\$7,268,432	C\$11,028,300
1924	8,806,896	12,990,026
1925	10,376,291	12,359,585
1926	10,254,512	13,028,726
1927	10,208,242	9,025,677

Coffee exports in 1927 were 10,255,112 kilo., valued at C\$4,081,605. In 1926 they were 17,671,644 kilo., valued at C\$8,100,397. Lumber, the second item of export, was valued at C\$1,725,749 in 1927, and at C\$1,342,238 in 1926. Bananas were exported in 1927 to a total of 2,386,191 bunches, worth C\$1,442,383, and in 1926 2,162,745 bunches, worth C\$1,225,661.

In the import trade of Nicaragua, the United States is the chief source, sending C\$6,777,574 in 1927; Great Britain second with C\$1,169,632 and Germany third with C\$687,812. The United States also receives the bulk of the exports. In 1927 France was second, Germany third and Great Britain fourth. Nicaragua exports a considerable number of cattle, including draught animals, to the other Central American countries. It is also a producer of gold and silver, the gold mines in the interior on the Caribbean side of the country having been the scene of the depredations of the *insurrecto* Sandino in 1927-28.

Communications.—Nicaragua has one excellent port, Corinto (*q.v.*), on the Pacific coast; and San Juan del Sur is also used for the southern part of the country. On the Caribbean coast, Bluefields (*q.v.*) and San Juan del Norte or Greytown (*q.v.*) are the chief ports, although San Juan is now virtually isolated by sand bars. Within the country communications are limited. The only railway is the Pacific railway, extending from Corinto to Granada, a distance of 118 m., but reaching en route Chinandega, León, Managua and Masaya, among the principal towns of the country. Highways are not greatly developed.

History.—The history of Nicaragua in connection with the other Central American countries and down to the dissolution of the Union is discussed in the article on CENTRAL AMERICA. The first white man to see Nicaragua was Gil González de Avila, who landed on the coast of Chirique in 1522. The leading Indian tribe of the country was then led by a great chief called Nicarao, from whom the country doubtless derived its name. Nicarao was baptized, and his tribe converted to the Roman Catholic faith, and moved with the Spaniards to the conquest of the other tribes. Hernán de Córdoba, who succeeded Gil González in command of the province for Spain, founded Granada in 1524, the city, then being situated between the two great lakes. Nicaragua was incorporated, for administrative purposes, in the captain-generalcy of Guatemala. Nicaragua, with independent existence dating from the dissolution of the Central American Union in 1838, early developed into a battle between the two rival cities of León and Granada, the former the capital of the Liberals, the latter of the Conservatives. In 1856 the American filibuster, William Walker (*q.v.*), arrived with his 66 followers, espousing the cause of León and waging a bitter war against the Granadinos which ended in his execution in 1860.

Nicaragua was in difficulties with various European powers from time to time during the ensuing period. In 1875, Germany blockaded Nicaraguan ports, and obtained an indemnity for alleged insults to a German consul. In 1895 the British blockaded Corinto to obtain redress for the arrest and expulsion of British Vice Consul Hatch at Bluefields. In 1909, two Americans, Cannon and Groce, were executed, after torture, and this led to an American naval demonstration and demands, and was one of the direct elements leading to American intervention. A period of comparative quiet existed in Nicaragua under a series of Conservative presidents until 1893, when José Santos Zelaya, a Liberal, seized the power as a result of a revolution and ruled Nicaragua until 1909. There were various attempts at revolution, but none succeeded until that of 1909, which broke out, as most insurrections in Nicaragua do, on the Caribbean seaboard. The United States broke off diplomatic relations with Zelaya as a result of the Cannon-Groce executions, describing the Zelaya

régime as a "blot on the history" of Nicaragua. The U.S. cruiser "Des Moines" prevented fighting at Bluefields on Dec. 18, 1909, thus making defeat of the Conservative revolutionists impossible, and inaugurating what is now known as the "intervention" of the United States against Zelaya and the Liberals who backed him. On Dec. 23, the Conservatives defeated the Zelaya troops at Rama, capturing most of the army, and on the following day Zelaya took refuge aboard a Mexican gunboat at Corinto and left the country. Dr. José Madriz, a Liberal, took the reins of Government, but the United States refused recognition; he was succeeded by Juan M. Estrada, an artisan, who had some Conservative and some Liberal backing and was regarded as a neutral. The United States accorded his Government recognition, but it was short-lived. Adolfo Díaz was elected provisional president in 1910. He was elected a second time in 1913, retiring in 1916; he was again chosen provisional president by vote of the senate in 1927. Under President Díaz, in 1912, the American marines were invited into Nicaragua on the plea of their need to protect foreign lives and property during the so-called Mena revolution, and the legation guard which succeeded the 1912 expeditionary force remained until 1925, and unquestionably preserved peace and gave Nicaragua the period of rest and recuperation which was marked by its prosperity. See CENTRAL AMERICA.

President Díaz was succeeded by Emiliano Chamorro in 1916, and he in turn by his nephew, Diego M. Chamorro (1920-23), who died in office and was succeeded by Dr. Bartolo Martínez, vice president. The election of 1924, under laws framed by an American expert but without the American supervision that had been planned, resulted in the election of a coalition ticket, President Solorzano being an anti-Chamorro Conservative, and Dr. Juan B. Sacasa, vice president, being the leader of the Liberals. Gen. Emiliano Chamorro, who stood again for the presidency as a Conservative, was defeated, and on Oct. 24, 1925, he led a *coup d'état* which captured the Loma, the fortified hill overlooking Managua, and forced the resignation and departure first of Vice President Sacasa and next of President Solorzano. Gen. Chamorro was named "designate" for the presidency by the senate, which had been changed in political complexion through the support of the Chamorro charges of fraud in the previous election (although previously these claims had been disallowed). Dr. Sacasa was declared to have given up his rights by his departure from the country and Gen. Chamorro assumed the presidency. The United States refused recognition, as did other Central American and European Governments. Dr. Sacasa, meanwhile, had pressed Washington for his own recognition as the legitimate president, but this was refused on the ground that he was not in his country nor in possession of the power. He left Washington and went to Mexico, where he had been recognized and where President Calles furnished him with arms, ammunition and men. The appearance of the Mexican element in the situation greatly disturbed Washington, and while before the attitude had been one of neutrality, the United States immediately moved to outwit the Mexican smuggling of arms, to isolate the fighting (the Sacasa forces had formed their bases on both the Caribbean and Pacific coasts) and to bring the revolution to an end with the elimination of Dr. Sacasa.

The American policy of isolating the fighting and landing marines and bluejackets to protect foreign interests and important cities resulted in the weakening of the Liberal offensive, and also in the resignation and flight of Gen. Chamorro. The Nicaraguan senate, reorganized with alternates or with the original members in their seats, elected Adolfo Díaz "designate" and thus automatically president. An outcry arose throughout Latin America that this appointment had been forced by the United States. Col. Henry L. Stimson, ex-secretary of War of the United States, went to Nicaragua as a personal representative of President Coolidge to find a way of stopping the revolution and settling difficulties. He succeeded in a remarkably short time in obtaining the consent of the Liberal leaders and the Conservative Government to an armistice, followed by the surrender of rifles, at C\$10 each, by the soldiers, and the agreement to an election at the end of 1928, supervised by American marines and officers.

The Liberals laid down their arms, with the exception of a single band of *insurrectos* led by Sandino, who were practically eliminated before the election. The new Guardia Nacional was organized, and American officers brought in to superintend the registration and election. The vote was taken on Sunday, Nov. 4, 1928, and resulted in an overwhelming victory for Gen. José M. Moncada, who was the leader of the Liberal army at the time of the signing of the Stimson armistice, as president, and Dr. Enoc Aguado, a Liberal jurist of Managua, as vice president.

(W. THO.)

NICASTRO, a town and episcopal see of Calabria, Italy, in the province of Catanzaro, 17 m. W.N.W. of it by rail, and 5½ m. E. of S. Eufemia, a station on the line along the west coast from Naples to Reggio di Calabria. Pop. (1921) 19,339 (town), 21,629 (commune). It is on the isthmus between the gulfs of S. Eufemia and of Squillace, the narrowest part of Calabria, 970 ft. above sea-level, and commands a fine view. Frederick II.'s son Henry was imprisoned in the castle. The place suffered greatly from the earthquake of 1638, which also destroyed the Benedictine abbey of S. Eufemia, founded by Robert Guiscard.

NICCOLI, NICCOLO DE' (1363–1437), Italian humanist, was born and died at Florence. He was one of the chief figures in the company of learned men which gathered round Cosimo de' Medici. Niccoli's chief services to classical literature consisted in his work as a copyist and collator of ancient mss. Many of the most valuable mss. in the Laurentian library are by his hand, amongst them those of Lucretius and of 12 comedies of Plautus. Niccoli's private library was the largest and best in Florence; he also possessed a small but valuable collection of ancient works of art, coins and medals. He regarded himself as an infallible critic, and could not bear the slightest contradiction.

See the *Life in Traversarii Epistolae* (ed. L. Mehus, 1759); G. Voigt, *Die Wiederbelebung des klassischen Altertums* (1893); G. Zippel, *Niccolò Niccoli* (Florence, 1890).

NICCOLITE, a mineral consisting of nickel arsenide, NiAs, containing 43.9% nickel. Crystals are hexagonal, but are rare and indistinct. It usually occurs as compact masses of a pale copper-red colour, with metallic lustre on the uneven fractured surfaces. It is opaque and brittle, and the streak is brownish-black. The specific gravity is 7.5 and the hardness 5½. Niccolite occurs with ores of cobalt, silver and copper at Annaberg and Schneeberg in Saxony, at Sangerhausen and Mansfeld in Prussian Saxony and other localities.

NICE, a city of France, the chief town of the department of the Alpes Maritimes, and previous to 1860 the capital of the county of Nice (Nizza) in the kingdom of Sardinia, 739 m. by rail from Paris. Pop. (1926) 144,360. The population fluctuates with the seasons, owing to the influx of winter visitors.

The town is situated at the mouth of the Paillon (Paglione), at the northern end of the Baie des Anges. The historical nucleus of the town is an isolated limestone hill, running back for some distance from the shore and formerly crowned by a castle. Towards its south-west corner stands a tower (Tour Bellanda or Clérissy) dating, it is said, from the 5th century. The old town stretches along the western base of the hill; the "town of the 18th century" on ground farther west slopes gently towards the Paillon; and to the north-east and north and west beyond the stream lies the modern city. To the east of the hill the commercial quarter sur-

rounds the port. The whole frontage of Nice is composed of fine embankments, notably the Promenade des Anglais begun 1822–24 at the cost of the English colony, and the course of the Paillon also is embanked on both sides. Besides a Roman Catholic cathedral—Ste. Réparate, dating from 1650—Nice possesses two Russian churches, two synagogues and an Anglican chapel. Architecturally the most remarkable church is Notre Dame du Voeu, a modern Gothic building. The lycée was founded by the Jesuits in the 17th century and at some distance from the town there is an astronomical and meteorological observatory on Mont Gros (1,220 ft.).

Industry and Trade.—The industrial establishments are perfumery factories, distilleries, oil-works, furniture and woodwork factories, confectionery works, soap-works, factories for silk goods, straw hats, rubber goods, pianolas, metal goods and a national tobacco factory. Besides the vine, the trees principally cultivated in the neighbourhood are the olive, the orange, the mulberry and the carob; and the staple exports are oil, agricultural produce, fruits and flowers. Nice now joins on the north-east the ancient episcopal town of Cimiez, where are the most luxurious hotels. Reckoning from east to west the town is surrounded by a girdle of beautiful towns—Carabacel, St. Etienne, St. Philippe and Les Beaumettes. On the east of the port lie Montboron, Riquier and St. Roch, the last partly occupied by barracks. The entrances to the port of Nice and the outer pier have been improved; that of the outer port is 300 ft. wide, and that of the inner 220 ft. The area of the harbour is about 8 acres; vessels drawing more than 23 ft. cannot enter; its trade is mostly coastal, principally in French and Italian vessels. Nice is an episcopal see (first mentioned at the end of the 4th century) under the archbishop of Aix. It belongs to the XV. military division (Marseilles). It is the seat of a prefect, of tribunals of first instance and of commerce, and of a board of trade arbitrators. The coastal railway is the main line of communication; an extension of the branch line up the Paillon valley to l'Ecarène joining the Ventimiglio-Coni (Cuneo)

THE GARDEN OF KING ALBERT I. IN NICE

line at Breil was opened on Oct. 30, 1928.

Climate.—Protected towards the north by hills which rise stage behind stage to the main ridge of the Alps, Nice is celebrated for the mildness of its climate. The mean temperature is 60°, that of winter being 49°, of spring 56°, of summer 72° and of autumn 63°. For a few nights in winter there is frost, but snow is practically unknown. The highest reading of the thermometer is rarely above 90°. There are sixty-seven days with rain in the course of the year; but it usually falls in heavy showers which soon leave the sky clear again; the whole annual amount exceeds

32 in. Fine days and rainy days are almost equally distributed throughout the different seasons. The winds are very variable, sometimes changing several times a day, but the most frequent is the east wind. April and May are the most windy months. The south-west wind (called *Libeccio*, or wind of Lybia) is moist and warm; the north-east (or *Gregau*, Greek), which is happily rare, brings storms of hail and even snow in winter. The mistral (from the north-west) and the tramontane (from the north) are generally stopped by the mountains. For two thousand years the climate of Nice has been considered favourable in chest complaints; it also benefits cases of gout, asthma, catarrhs, rachitic affections, scrofula, stone; but the reverse is the case when heart disease, nervous disorders or ophthalmia are concerned. Autumn is the best season; in spring the sudden changes of temperature demand great care. The city is famous for its carnival festivities, especially the "battle of flowers."

History.—Nice (*Nicaea*) was founded about two thousand years ago by the Phocaeans of Marseilles, and was named in honour of a victory (*νίκη*) over the neighbouring Ligurians. It soon became a busy trading station, but had a rival in the town of Cemenelum, in existence till the time of the Lombard invasions, which has left its ruins at Cimiez. In the 7th century Nice joined the Genoese league formed by the towns of Liguria. In 729 it repulsed the Saracens; but in 859 and 880 they pillaged and burned it, and for the most of the 10th century remained masters of the surrounding country. As an ally of Pisa Nice was the enemy of Genoa, and both the king of France and the emperor endeavoured to subjugate it; but it maintained its liberties. In the course of the 13th and 14th centuries it fell more than once into the hands of the counts of Provence; and at length in 1388 it placed itself under the protection of the counts of Savoy. The maritime strength of Nice now rapidly increased till it was able to cope with the Barbary pirates; the fortifications were largely extended and the roads to the city improved. During the struggle between Francis I. and Charles V. great damage was caused by the passage of the armies invading Provence; pestilence and famine raged in the city for several years. In 1543 Nice was attacked by the united forces of Francis I. and Barbarossa; and the inhabitants were ultimately compelled to surrender, and Barbarossa was allowed to pillage the city and to carry off 2,500 captives. Pestilence appeared again in 1550 and 1580. In 1600 Nice was taken by the duke of Guise.

By opening the ports of the countship to all nations, and proclaiming full freedom of trade, Charles Emmanuel in 1626 gave a great stimulus to the city. Captured by Catinat in 1691, Nice was restored to Savoy in 1696, but it was again besieged by the French in 1705, and in the following year its citadel and ramparts were demolished. The treaty of Utrecht in 1713 once more gave the city back to Savoy; and in the peaceful years which followed the "new town" was built. From 1744 till the peace of Aix-la-Chapelle (1748) the French and Spaniards were again in possession. In 1775 the king of Sardinia destroyed all that remained of the ancient liberties of the commune. Conquered in 1792 by the armies of the French Republic, the county of Nice continued to be part of France till 1814; but after that date it reverted to Sardinia. By a treaty concluded in 1860 between the Sardinian king and Napoleon III. it was again transferred to France.

NICEPHORUS, the name of three emperors of the East.

NICEPHORUS I., emperor 802–811, was a native of Seleucia in Pisidia, who was raised by the empress Irene to the office of *logothetes*. With the help of the patricians and eunuchs he contrived to dethrone Irene, and to be elected emperor. His sovereignty was endangered by the revolt of his general Bardanes. But Nicephorus achieved the submission of Bardanes, who was relegated to a monastery. A conspiracy headed by the patrician Arsaber had a similar issue. Nicephorus set himself with great energy to increase the empire's revenue. By his rigorous imposts he alienated the favour of his subjects, and especially of the clergy. In 803 and 810 he made a treaty with Charlemagne, by which the limits of the two empires were amicably fixed. Venice, Istria, the Dalmatian coast and South Italy were assigned to the East, while Rome, Ravenna and the Pentapolis were included in the Western realm. By withholding the tribute which Irene had

agreed to pay to Harun al-Rashid, Nicephorus committed himself to a war with the Saracens. Compelled by Bardanes's disloyalty to take the field himself, he sustained a severe defeat at Crasus in Phrygia (805), and only obtained peace on condition of paying a yearly contribution of 30,000 gold pieces. By the death of Harun in 809, Nicephorus was left free to deal with the Bulgarian king, Krum, who was harassing his northern frontiers. In 811 Nicephorus invaded Bulgaria and drove Krum to ask for terms, but in a night attack he allowed himself to be surprised and was slain along with a large portion of his army.

See Gibbon, ed. Bury (1911) vol. v., p. 204–205, Bury's *Eastern Roman Empire*.

NICEPHORUS II. (Phocas), emperor 963–969, belonged to a Cappadocian family which had produced several distinguished generals. He was born about 912, joined the army at an early age, and, under Constantine VII., became commander on the eastern frontier. In the war with the Saracens he began with a severe defeat (956), which he retrieved in the years following by victories in Syria. In 960 he led an expedition to Crete, and wrested the whole island from the Saracens. He then returned to the east with a large and well-equipped army. In the campaigns of 962–963 he forced his way through Cilicia to Syria and captured Aleppo, but made no permanent conquests. Upon the death of Romanus II., Nicephorus was proclaimed emperor by the eastern troops, and was eventually acknowledged at Constantinople as colleague of the infant sons of Romanus. In 964–966 he definitely conquered Cilicia and again overran Mesopotamia and Syria, while the patrician Nicetas recovered Cyprus. In 968 he reduced most of the fortresses in Syria, and after the fall of Antioch and Aleppo (969), which were recaptured by his lieutenants, secured his conquests by a peace. On his northern frontier he began a war against the Bulgarians, to whom the Byzantines had of late been paying tribute (967), and by instigating an attack from the Russians distracted their attention effectively. Nicephorus was less successful in his western wars. After renouncing his tribute to the Fatimite caliphs, he sent an expedition to Sicily under Nicetas (964–965), but was forced by defeats on land and sea to evacuate that island completely. In 967 he made peace with the Saracens of Kairawan and turned to defend himself against their common enemy, Otto I. of Germany, who had attacked the Byzantine possessions in Italy; but after some initial successes his generals were defeated and driven back upon the southern coast. Owing to the care which he lavished upon the proper maintenance of the army, Nicephorus was compelled to exercise rigid economy in other departments. By his heavy imposts and the debasement of the coinage he forfeited his popularity with the rest of the community, and gave rise to riots. He was finally assassinated in his sleeping apartment by his nephew and successor John Zimisces. Nicephorus was the author of an extant treatise on military tactics.

NICEPHORUS III. (Botaniates), emperor 1078–1081, rose to be commander of the troops in Asia. He revolted in 1078 from Michael VII., and with the connivance of the Turks assumed the purple. In face of another rebellious general, Nicephorus Bryennius, his election was ratified by the aristocracy and clergy. With the help of Alexius Comnenus he drove out of the field Bryennius and other rivals, but failed to clear the invading Turks out of Asia Minor. Nicephorus ultimately quarrelled with Alexius, and was banished to a monastery.

See Gibbon, *Decline and Fall* (ed. Bury, 1911); Finlay, *Hist. of Greece*; G. Schlumberger, *Nicéphore Phocas* (Paris, 1890); K. Leonardt, *Kaiser Nicephorus II.* (Halle, 1887).

NICEPHORUS PATRIARCHA (c. 758–829), Byzantine historian and patriarch of Constantinople (806–815). He was, like his father Theodorus, a zealous opponent of Iconoclasm. He was secretary to the imperial commissaries at the council of Nicaea in 787, which witnessed the triumph of his opinions; but, feeling dissatisfied with court life, he retired into a convent. In 806 he suddenly succeeded Tarasius as patriarch of Constantinople, but was deposed by the Iconoclast Leo V. in 815 and died in exile 827. After his death he was included among the saints of the Orthodox Church.

Nicephorus is the author of two important works on the iconoclastic questions: the *Apologeticus Maior* (817) and the *Apologeticus Minor*; his historical works are two: the *Chronologia Compendiaria*, a table of dates from Adam to the year of his own death; the *Breviarium Historicum*, a history of the years 602-799—a very poor composition, only valuable owing to the paucity of other materials. Editions: Complete, J. P. Migne, *Patrologia Graeca*, vol. c. Theological: A Mai, *Nova Patrum Bibliotheca* i., ii. and iii. Historical: de Boor Teubner, 1880. See also Krumbacher, *Geschichte der byzantinischen Literatur* (1897) and A. Burckhardt in *Byzantinische Zeitschrift* 5. p. 465.

NICHOLAS, ST., bishop of Myra, in Lycia, a saint honoured by the Greeks and the Latins on the 6th of December. His cult is as celebrated as his history is obscure. He was bishop of Myra in the time of the emperor Diocletian, was persecuted, tortured for the faith, and kept in prison until the more tolerant reign of Constantine, and is said to have been present at the council of Nicaea, though Athanasius, who knew all the notable bishops of the period, never mentions Nicholas, bishop of Myra. The oldest known monument of the cult of St. Nicholas seems to be the church of SS. Priscus and Nicholas built at Constantinople by the emperor Justinian. (See Procopius, *De aedif.* i. 6.) In the West, the name of St. Nicholas appears in the 9th century martyrologies, and churches dedicated to him are to be found at the beginning of the 11th century. It is more especially, however, from the time of the removal of his body to Bari, in Apulia, that his cult became popular. The inhabitants of Bari organized an expedition, seized his remains by means of a ruse, and transported them to Bari, where they were received in triumph on May 9, 1087, and where the foundations were laid of a new basilica in his honour. This was the origin of a famous and still popular pilgrimage. There are nearly 400 churches in England dedicated to St. Nicholas. He is the patron saint of Russia; the special protector of children, scholars, merchants and sailors; and is invoked by travellers against robbers. In art St. Nicholas is represented with various attributes, being most commonly depicted with three children standing in a tub by his side.

A legend of his surreptitious bestowal of dowries upon the three daughters of an impoverished citizen, who, unable to procure fit marriages for them, was on the point of giving them up to a life of shame, is said to have originated the old custom of giving presents in secret on the Eve of St. Nicholas, subsequently transferred to Christmas Day. Hence the association of Christmas with "Santa Claus," an American corruption of the Dutch form "San Nicolaas," the custom being brought to America by the early Dutch colonists. (For the ceremony of the boy-bishop elected on St. Nicholas's Day see BOY-BISHOP.)

Nitti di Vito, *Le Pergamene di S. Nicola di Bari* (Bari, 1901); Charles Cahier, *Caractéristiques des saints* (Paris, 1867), p. 354; Frances Arnold-Forster, *Studies in Church Dedications* (London, 1899), i. 495-501 and iii. 21; L'abbé Marin, *Saint Nicholas, évêque de Myre* (1917).

NICHOLAS I., sometimes called The Great, and certainly the most commanding figure in the series of popes between Gregory I. and Gregory VII., succeeded Benedict III. in April 858. According to the annalist Prudentius of Troyes, "he owed his election less to the choice of the clergy than to the presence and favour of the emperor Louis II. and his nobles"—who can hardly have foreseen with what ability and persistency the rights of the Holy See as supreme arbiter of Christendom were to be asserted even against themselves by the man of their choice. Of the previous history of Nicholas nothing is recorded. His pontificate of nine years and a half was marked by at least three memorable contests which have left their mark in history. The first was that in which he supported the claims of the unjustly degraded patriarch of Constantinople, Ignatius (*q.v.*); but two of its incidents, the excommunication of Photius (*q.v.*), the rival of Ignatius, by the pope in 863, and the counter-deposition of Nicholas by Photius in 867, were steps of serious moment towards the permanent separation between the Eastern and the Western Church.

The second great struggle was that with Lothair (*q.v.*) the king of Lorraine (second son of the emperor Lothair I., and brother of the emperor Louis II.), about the divorce of his wife Theut-

berga or Thietberga. The pope not only quashed the whole proceedings against Theutberga, but excommunicated and deposed bishops Gunther and Thietgaud, who had been audacious enough to bring to Rome in person the "libellus" of the synod which had given judgment. The archbishops appealed to Louis II., then at Benevento, to obtain the withdrawal of their sentence by force; but, although he actually occupied the Leonine city (864), he was unsuccessful in obtaining any concession, and had to withdraw to Ravenna.

The third great ecclesiastical cause which marks this pontificate was that in which the right of bishops to appeal to Rome against their metropolitans was maintained in the case of Rothad of Soissons, deposed by Hincmar of Reims. In the course of the controversy with the great and powerful Neustrian archbishop papal recognition was first given (in 865) to the False Decretals, which had probably been brought by Rothad to Rome in the preceding year. (See DECETALS.) Nicholas was the pope to whom Boris, the newly converted king of Bulgaria, addressed himself for practical advice in some of the difficult moral and social problems arising out of the transition from heathenism to Christianity. The pope's letter in reply to the hundred and six questions and petitions of the barbarian king is perhaps the most interesting literary relic of Nicholas I. now extant. He died on Nov. 13, 867, and was succeeded by Adrian II.

The *epistolae* of Nicholas I. are printed in Migne, *Patrologia Lat.* vol. 119, p. 769 seq. See F. Gregorovius, *Rome in the Middle Ages*, vol. iii. (Eng. trans., London, 1900-1902); H. Lämmer, *Nikolaus I. und die byzantinische Staatskirche seiner Zeit* (Berlin, 1857); J. Roy, *Saint-Nicolas I.* (Paris, 1900); J. Richterich, *Papst Nikolaus I.* (Bern, 1903); A. Greinacher, *Die Anschauungen des Papstes Nikolaus I. über das Verhältnis von Staat und Kirche* (1909).

NICHOLAS II., pope from December 1058 to July 1061, was a Burgundian named Gerard, who at the time of his election was bishop of Florence. He was set up by Hildebrand, with the support of the empress-regent Agnes and of the powerful Duke Godfrey of Lorraine, against Benedict X., the nominee of the Roman nobles, and was crowned at Rome, after the expulsion of Benedict, on Jan. 24, 1059. He continued the policy of ecclesiastical reform associated with the name of Hildebrand (afterwards Gregory VII.). He entered into relation with the Normans, now firmly established in southern Italy, and the new alliance was cemented at Melfi, where Nicholas II., invested (1059) Robert Guiscard with the duchies of Apulia, Calabria and Sicily, and Richard of Aversa with the principality of Capua, in return for fealty and the promise of assistance. The first fruits of this arrangement, based on no firmer foundation than the forged "Donation of Constantine" (*q.v.*), but destined to make the papacy more independent in both the Eastern and Western Empires, was the reduction in the autumn, with Norman aid, of Galera, where the anti-pope had taken refuge, and the end of the subordination of the papacy to the Roman nobles.

Meanwhile Nicholas had sent legates to Milan to adjust the difference between the Patarenes and the archbishop and clergy. Archbishop Wido, in face of the ruinous conflict in the Church of Milan, was forced to submit to the terms proposed by the legates, involving the subordination of Milan to Rome; the new relation was advertised by the unwilling attendance of Wido and the other Milanese bishops at the council summoned to the Lateran palace in April 1059. This council continued the Hildebrandine reforms by sharpening the discipline of the clergy, and regulated future elections to the Holy See. (See LATERAN COUNCILS, and CONCLAVE.) The emperor's traditional rights in the matter of papal elections were completely ignored. Stephen, cardinal priest of S. Chrysogonus, was sent to the German court to attempt to allay the consequent ill-feeling, but was not received. Pope Nicholas, moreover, had offended the German bishops by what they regarded as arbitrary interference with their rights; they retaliated, in a synod held early in 1061, by declaring the new electoral law annulled, and the pope himself deposed. But party strife in Germany enabled the pope to ignore these proceedings. Nicholas II. died at Florence in July 1061.

His *Diplomata, epistolae, decreta* are in Migne, *Patrolog. Lat.* 143, pp. 1301-1366. See the article "Nikolaus II." by C. Mibt in Herzog-

Hauck, *Realencyklopädie* (3rd ed., Leipzig, 1904), with bibliography. Other lists of authorities are in Potthast, *Biblioth. Hist. Med. Aev.* (2nd ed., Berlin, 1896), p. 854; and Ulysse Chevalier, *Répertoire des sources hist. bibliogr.* (Paris, 1905), vol. 3347, s.v. "Nicolas II."

NICHOLAS III. (Giovanni Gaetano Orsini), pope from Nov. 25, 1277 to the 22nd of August 1280, was a Roman nobleman who had served under eight popes. He succeeded John XXI., largely through family influence, after a six-months' vacancy in the Holy See. A born politician, he concluded a concordat with Rudolph of Habsburg in May 1278, by which the Romagna and the exarchate of Ravenna were guaranteed to the pope; and in July he issued an epoch-making constitution for the government of Rome, which forbade foreigners taking civil office. Nicholas issued the bull *Exiit* on Aug. 14, 1279, to settle the strife within the Franciscan order between the parties of strict and loose observance. He repaired the Lateran and the Vatican at enormous cost. Nicholas brought just reproach on himself by his nepotism. See also the *Catholic Encyclopaedia* (s.v.).

Roman.* vol. 2 (Berlin, 1875); A. Demski, "Papst Nikolaus III.," in *Kirchengeschichtliche Studien* (Münster, 1903); F. Gregorovius, *Rome in the Middle Ages*, vol. 5, trans. by Mrs. G. W. Hamilton (London, 1900-1902); Fr. Wertsch, *Die Beziehungen Rudolfs von Habsburg zur röm. Kurie bis zum Tode Nikolaus III.* (Bochum, 1880); G. Palmieri, *Introiti ed esiti di Papa Niccolò III.* (Rome, 1889).

NICHOLAS IV. (Girolamo Masci), pope from Feb. 22, 1288, to April 4, 1292, a native of Ascoli and a Franciscan monk, succeeded St. Bonaventura as general of his order in 1274, was made cardinal-priest of Sta. Prassede and Latin patriarch of Constantinople by Nicholas III., cardinal-bishop of Palestrina by Martin IV., and succeeded Honorius IV. after a ten-months' vacancy in the papacy. He was a pious, peace-loving monk with no ambition save for the church, the crusades and the extirpation of heresy. He steered a middle course between the factions at Rome, and sought a settlement of the Sicilian question. In May 1289 he crowned Charles II. king of Naples and Sicily after the latter had expressly recognized papal suzerainty, and in February 1291 concluded a treaty with Alphonso III. of Aragon and Philip IV. of France looking toward the expulsion of James of Aragon from Sicily. The loss of Ptolemais in 1291 stirred the pope to renewed enthusiasm for a crusade. He sent the celebrated Franciscan missionary, John of Monte Corvino (q.v.), with some companions to labour among the Tatars and Chinese. He issued an important constitution on July 18, 1289, which granted to the cardinals one-half of all income accruing to the Roman see and a share in the financial management, and thereby paved the way for that independence of the college of cardinals which, in the following century, was to be of detriment to the papacy. Nicholas was succeeded by Celestine V.

Kirsch, "Die Finanzverwaltung des Kardinalkollegiums im 13. u. 14. Jahrhundert," in *Kirchengeschichtliche Studien* (1895). See also the *Catholic Encyclopaedia* (s.v.).

NICHOLAS V. (Tomaso Parentucelli or Tomaso da Sarzana), pope from March 6, 1447, to March 24, 1455, was born at Sarzana, where his father was a physician, in 1398. In 1444 he was made bishop of Bologna by Pope Eugenius IV., who sent him to Frankfort to negotiate an understanding between the Holy See and the empire with regard to the reforming decrees of the council of Basel. On his return to Rome, he was made cardinal priest of Sta. Susanna (December 1446). He was elected pope in succession to Eugenius IV. on March 6, 1447.

With the German king, Frederick III., he made the Concordat of Vienna, or Aschaffenburg (Feb. 17, 1448), by which the decrees of the council of Basel against papal annates and reservations

were abrogated so far as Germany was concerned; and in the following year he secured a still greater triumph when the resignation of the anti-pope Felix V. (April 7), and his own recognition by the rump of the council of Basel, assembled at Lausanne, put an end to the papal schism. The next year, 1450, Nicholas held a jubilee at Rome. In March 1452 he crowned Frederick III. as emperor in St. Peter's, the last occasion of the coronation of an emperor at Rome. Under the generous patronage of Nicholas humanism made rapid strides. He employed hundreds of copyists and scholars, giving as much as ten thousand *gulden* for a metrical translation of Homer, and founded a library of nine thousand volumes. He restored the walls and numerous churches of Rome and began the rebuilding of the Vatican and St. Peter's.

In 1452 a formidable conspiracy for the overthrow of the papal government, under the leadership of Stefano Porcario, was discovered and crushed. This revelation of disaffection, together with the fall of Constantinople, darkened the last years of Nicholas; "As Thomas of Sarzana," he said, "I had more happiness in a day than now in a whole year." He died on March 24, 1455.

NICHOLAS V. (Pietro Rainalducci), antipope in Italy from 1328 to 1330 during the pontificate of John XXII. at Avignon, a native of Corbara in the Abruzzi, joined the Franciscan order in 1310. He was elected through the influence of the excommunicated emperor, Louis the Bavarian, by an assembly of priests and laymen, and consecrated at St. Peter's on May 12, 1328, by the bishop of Venice. After spending four months in Rome, he withdrew with Louis to Viterbo and thence to Pisa, where he was guarded by the imperial vicar. He was excommunicated by John XXII. in April 1329, and sought refuge with Count Boniface of Donoratico near Piombino. Having obtained assurance of pardon, he presented a confession of his sins first to the archbishop of Pisa, and then (Aug. 25, 1330) to the pope at Avignon. He remained in honourable imprisonment in the papal palace until his death in October 1333.

Christophe, *Histoire de la papauté pendant le XIV^{ème} siècle*, vol. 1 (Paris, 1853); E. Marcour, *Anteil der Minoriten am Kampfe zwischen König Ludwig IV. von Bayern und Papst Johann XXII.* (Emmerich, 1874); Eubel, "Der Gegenpapst Nikolaus V. u. seine Hierarchie," in *Hist. Jahrbuch*, vol. 12 (1891).

NICHOLAS I. [NIKOLAI PAVLOVICH], emperor of Russia (1796-1855), eighth child of the emperor Paul I. and his wife Maria Feodorovna, was born at Tsarskoe-Selo on June 25 (July 6, N.S.), 1796. He was only five years old when his father's murder brought his brother Alexander I. to the throne (1801). His education was supervised by M. von Lambsdorff, director of the 1st cadet corps and ex-governor of Courland. But Nicholas and his brother Constantine had little taste for learning. They were interested mainly in military matters.

The grand-duke Nicholas joined the Russian headquarters in France in 1814, but not to take part in any fighting. In 1815 he was with the Allies in Paris, and in the following year set out on the *grand tour*, visiting Moscow and the western provinces of Russia, Berlin (where he was betrothed to Princess Charlotte Louise, daughter of Frederick William III.), and England. His marriage marked the beginning of intimate relations between the courts of Berlin and St. Petersburg. On the 17/29th of April 1818 their first child, the future emperor Alexander II., was born. In the autumn Nicholas was placed in command of the 2nd brigade of the 1st division of the Guard.

Alexander I. died at Taganrog on Dec. 1, 1825. Constantine was at Warsaw; Nicholas was too conscious of his unpopularity in the army—the fruit of his drastic discipline—to dare to assume the crown without a public abdication on the part of the legitimate heir. The result (see CONSTANTINE PAVLOVICH) was a three weeks' interregnum, of which the discontented spirits in the army took advantage to bring to a head a plot that had long been

hatching in favour of constitutional reform. When on Dec. 14 the troops who had already taken the oath to Constantine were ordered to take another to Nicholas, it was easy to persuade them that this was a treasonable plot against the true emperor. The Moscow regiment refused to take the oath, and part of it marched, shouting for Constantine and "Constitution," to the square before the Senate House, where they were joined by a company of the Guard and the sailors from the warships. In this crisis Nicholas showed high personal courage, if little decision and initiative. For hours he stood, or sat on horseback, amid the surging crowd, facing the mutinous soldiers—who had loaded their muskets and formed square—while effort after effort was made to bring them to reason, sometimes at the cost of life—as in the case of Count Miloradovich, military governor of St. Petersburg, who was mortally wounded by a pistol shot while arguing with the mutineers. When at last the emperor consented to use force, a few rounds of grape-shot sufficed to quell the mutiny. The chief conspirators—Prince Shchepin-Rostovski, Suthoff, Ryleyev, Prince Sergius Trubetskoi, Prince Obolenski and others—were arrested the same night and interrogated by the emperor in person. A special commission, consisting entirely of officers, was then set up; and before this, for five months, the prisoners were subjected to a rigorous inquisition. The prisoners were kept in solitary confinement in the casemates of the inner fortress of St. Peter and St. Paul. They were brought blindfolded before the commission, and then suddenly confronted with their interrogators. Many went mad under the ordeal, one died, and one starved himself to death (Schiemann, ii. 73). It was soon clear that the Dekabrist (December) rising was but one manifestation of a vast conspiracy permeating the whole army. A military rising on a large scale in the south was only averted by the news of the failure of the mutiny at St. Petersburg; and at Moscow there were many arrests, including that of Colonel Paul Pestel, the chief of the revolutionary southern league. The 121 prisoners were finally brought to trial before a supreme criminal court, established by imperial *ukaz* (June 1-12, 1826). Some were condemned to death, others to solitary confinement in fortresses, others to the Siberian mines and colonies. Of the latter many were accompanied by their wives, though the Russian law allows divorce in the case of such sentences; the emperor unwillingly allowed the devoted women to go, but decreed that any children born to them in Siberia would be illegitimate.

In spite of his reverence for his brother's memory, Nicholas made a clean sweep of "the angel's" Bible Society; as for Alexander's projects of reform, the pitiful legacy of a life of unfulfilled purposes, these were reported upon by committees, and shelved. Nicholas too saw the need for reform; the Dekabrist conspiracy had burnt that into his soul; but he had his own views as to the reform needed. The state was corrupt, disorganized; what was wanted was not more liberty but more discipline. So he put civil servants, professors and students into uniform, and for little offences had them marched to the guard-house; thought was disciplined by the censorship, the army by an unceasing round of parades and inspections. The one great gift of Nicholas I. to Russia, a gift which he really believed would be welcome because it would bring every subject into immediate contact with the throne, was—the secret police, the dreaded Third Section of the Private Chancery of the emperor.

The crowning fault of Nicholas was, however, that he would not delegate his authority; whom could he trust but himself? In this he resembled his contemporary the emperor Francis I. But Francis would "sleep upon" a difficult problem; Nicholas never slept. His constitution was of iron, his capacity for work prodigious; reviews and parades, receptions of deputations, visits to public institutions, then eight or nine hours in his cabinet reading and deciding on reports and despatches—such was his ordinary day's work. Under the "Iron Tsar" the outward semblance of authority was perfectly maintained; but behind this imposing façade the whole structure of the Russian administrative system continued to rot and crumble.

Revelations of the rottenness of the under-structure had, indeed, begun before the outbreak of the war with Turkey in 1828. The newly organized squadron which in 1827 set out on the cruise

which ended at Navarino only reached Plymouth with difficulty, and there had to be completely refitted. The disastrous Balkan campaign of 1828 was an even more astounding revelation of corruption, disorganization and folly in high places. The weary and starving soldiers were forced to turn out amid the marshes of the Dobrukscha before the emperor as spick and span as on the parade grounds of St. Petersburg; but he could do nothing to set order in the confusion of the commissariat, which caused the troops to die like flies of dysentery and scurvy; or to remedy the scandals of the hospitals. His presence hampered the initiative of Prince Wittgenstein, the nominal commander-in-chief; for Nicholas was incapable of leaving him a free hand.

These then were the leading principles which underlay Nicholas's domestic and foreign policy from first to last: to discipline Russia, and by means of a disciplined Russia to discipline the world. The mission of Russia in the West was, in accordance with the principles of the Holy Alliance as Nicholas interpreted them, to uphold the cause of legitimacy and autocracy against the Revolution; her mission in the East was, with or without the co-operation of "Europe," to advance the cause of Orthodox Christianity, of which she was the natural protector, at the expense of the decaying Ottoman empire. The sympathy of Europe with the insurgent Greeks gave the tsar his opportunity. The duke of Wellington was sent to St. Petersburg in 1826 to congratulate the new tsar on his accession and arrange a concert in the Eastern Question. The upshot proved the diplomatic value of Nicholas's apparent sincerity of purpose and charm of manner; the "Iron Duke" was to the "Iron Tsar" as soft iron to steel; Great Britain, without efficient guarantees for the future, stood committed to the policy which ended in the destruction of the Ottoman sea-power at Navarino and the march of the Russians on Constantinople. By the treaty of Adrianople in 1829 Turkey seemed to become little better than a vassal state of the tsar, a relation intensified, after the first revolt of Mehemet Ali, by the treaty of Unkiar-Skelessi in 1833. In the West, Nicholas himself proposed an armed intervention of the Alliance "to restore order" in Belgium and France; and when his allies held back even proposed to intervene alone, a project rendered impossible by the outbreak of the great insurrection in Poland, which tied the hands of all three powers.

Then, the insurrection in Poland once crushed, and Poland itself scarce surviving even as a geographical expression, he drew the three eastern autocratic powers together in a new "Holy Alliance" by the secret convention of Berlin (Oct. 3, 1833) reaffirming the right and duty of intervention at the request of a legitimate sovereign. The cordial understanding with Austria, cemented at Münchengrätz and Berlin, was renewed, after the accession of the emperor Ferdinand, at Prague and Töplitz (1835); on the latter occasion it was decided "without difficulty" to suppress the republic of Cracow, as a centre of revolutionary agitation. He allowed himself to be persuaded by Metternich to support the cause of Don Carlos in Spain, and so early as May 1837, in view of the agitation in Hungary, he announced that "in every case" Austria might count on Russia.

These cordial ties were loosened, however, by the fresh crisis in the Eastern Question after 1838. Metternich was anxious to summon a European conference to Vienna, with a view to placing Turkey under a collective guarantee. Nicholas refused to be a party to it. Moreover, as Austria showed an inclination to approach the maritime powers, he determined to come to an agreement with Great Britain, in order to settle the Eastern Question according to his own views; this is the explanation of those concessions in the Eastern Question which ended in the Quadruple Alliance of 1840 and the humiliation of Louis Philippe's government. The new Anglo-Russian *entente* led in 1844 to a visit of the tsar to the English court. (See EASTERN QUESTION.)

When the storm of revolution burst over Europe in 1848, Nicholas remained entrenched behind the barriers of his own disciplined empire. But in 1849 he intervened in Hungary, at the entreaty of Francis Joseph, crushed the insurgent Hungarians and handed back their country as a free gift to the Habsburg king. Scarcely less valuable to Austria was the tsar's intervention in the quarrel between Austria and Prussia arising out of the Hesse inci-

dent and the general question of the hegemony of Germany. In October 1850 he had a meeting with Francis Joseph at Warsaw, at which Count Brandenburg and Prince Schwarzenberg were present. Prussia, he declared, must in the German question return to the basis of the treaties of 1815 and renew her *entente* with Austria; this was the only way of preserving the old friendship of Prussia and Russia. In face of the threat conveyed in this, the Prussian government decided to maintain peace (Nov. 2), Radowicz resigning as a protest. Thus Nicholas, who refused to believe in the perfidy ascribed by Frederick William to Austria, was the immediate cause of Prussia's humiliation at Olmütz.

Nicholas was soon to have personal experience of the perfidy of Austria in the troubles that led up to the Crimean War. Gratitude, in the tsar's opinion, should have made her neutral if not friendly. When the dispute arose with Napoleon III. over the guardianship of the Holy Places Nicholas could not believe that Christian powers would resent his claim to protect the Christian subjects of the sultan; he believed he could count on the friendship of Austria and Prussia; as for Great Britain, he would try to come to a frank understanding with her. The disillusionment that followed was profound. In October 1853 Nicholas met his brother monarchs of the triple alliance at Warsaw for the last time. In December, at the conference of Vienna, Austria had already passed over to the enemy. Prussia was wavering, neutral indeed, but joining the other powers in a guarantee of the integrity of Turkey (April 9, 1854), urging the tsar to accept the decisions of the Vienna conference, and on his refusal signing a defensive alliance with Austria (April 20, 1854), which included among the *casus belli* the incorporation in Russia of the banks of the Danube and a Russian march on Constantinople. Thus Nicholas, the pillar of the European alliance, found himself isolated and at war, or potentially at war, with all Europe. The invasion of the Crimea followed, and with it a fresh revelation of the corruption and demoralization of the Russian system. At the outset Nicholas had grimly remarked that "Generals January and February" would prove his best allies. These acted, however, impartially; and if thousands of British and French soldiers perished of cold and disease in the trenches before Sevastopol, the tracks leading from the centre of Russia into the Crimea were marked by the bones of Russian dead. The revelation of his failure broke the spirit of the Iron Tsar, and on March 2, 1855, he threw away the life which a little ordinary care would have saved.

BIBLIOGRAPHY.—All other works on Nicholas I. were more or less superseded by Professor Theodor Schiemann's *Geschichte Russlands unter Kaiser Nikolaus I.*, of which the 1st vol., *Kaiser Alexander I. und die Ergebnisse seiner Lebensarbeit*, was published at Berlin in 1904; the 2nd, carrying the history of Nicholas's reign down to the revolutions of 1830, in 1908. It is based on a large mass of unpublished material, and considerably modifies, e.g., the account of the accession of Nicholas and of the Dekabrist conspiracy given in chapter xiii. of vol. x. of the *Cambridge Modern History*, and tells for the first time the secret history of the Russo-Turkish War of 1828–29. The great *Recueil des traités conclus par la Russie* of T. T. de Martens (St. Petersburg, 1874–1909) contains admirable introductory essays, based on the unpublished Russian archives, and giving much material for the study of Nicholas's character and policy. Many documents are published for the first time in Schiemann's work; some, from the archives of Count Nesselrode, are published in the *Lettres et papiers du Chancelier Comte de Nesselrode*, t. vi. seq. For other works see bibliographies attached to the chapters on Russia in vol. x. and xi. of the *Cambridge Modern History*. (W. A. P.; X.)

NICHOLAS II. (1868–1918), tsar of Russia, eldest son of Alexander III., was born at St. Petersburg (Leningrad), on May 18, 1868. An English tutor, Mr. Charles Heath, taught him excellent English, and inspired a love of sports and healthy exercise, while a Russian general, Danilovich, supervised his military training, but there was no attempt to provide him with the comprehensive knowledge required from one whom fate had destined to rule an immense empire. The only occasion which was offered to the young tsarevich to acquaint himself with the problems of the world was his journey to the Far East, so abruptly cut short in Kyoto by the sabre cut of a Japanese fanatic.

He wedded Princess Alix of Hesse at the deathbed of his father; at the festival of his coronation more than 3,000 people were crushed to death through the negligence of the officials who had

to arrange a distribution of bounties; and during the coronation itself the imperial chain on his breast fell to the ground. Such impressions contributed strongly to inspire him with a mystic resignation, especially unsuitable for a monarch who had to lead the nation through times of great crisis at home and in foreign affairs. Nicholas II. followed in the footsteps of his father, seeking to preserve peace in foreign relations, and continuing in home affairs, though in a much milder form, the policy of centralization and Russification which had characterized the previous reign. His pacific tendencies were shown by his systematic opposition to all bellicose excitement, by his maintaining M. de Giers in the post of minister of foreign affairs, by his offering the post, on the death of that statesman, to M. de Staal, by his restraining France from dangerous adventures, and by initiating the Peace Conference at The Hague. To these ought perhaps to be added the transformation of the Franco-Russian *entente cordiale* into a formal alliance, since the alliance in question might be regarded as favourable to the preservation of the *status quo* in Europe. In the internal administration during the first years of his reign he introduced by his personal influence, and without any great change in the laws, a more humane spirit towards those of his subjects who did not belong by language and tradition to the dominant nationality, and who were not members of the Eastern Orthodox Church; but he disappointed the men of liberal views by giving it to be clearly understood soon after his accession that he had no intention of circumscribing and weakening the autocratic power by constitutional guarantees or parliamentary institutions. In spite, however, of his desire for peace he let his country drift into the disastrous war with Japan; and notwithstanding his sincere attachment to the principles of bureaucratic autocracy, it was he who granted the constitutional reforms which altered the whole political outlook in Russia. (See RUSSIA.)

Nicholas II.'s political outlook was dominated by a kind of theocratic or hieratic spirit; he was looking back for inspirations to the ideas and customs of the Muscovite period; he was induced to impersonate the figure of Alexis Mikhailovich, the father of the western reformer Peter the Great; in 1913 the tercentenary of Michail Feodorovich's accession to the throne after the "Great Troubles" was celebrated with much splendour and emphasis. Pilgrimages were performed with great devotion and circumstance.

The courtiers and bureaucrats in the immediate surroundings of the tsar, men like Sipiaguin, Nicolas Maklakov and Sabler, took advantage of these prepossessions in order to keep up a constant hostility against progressive reformers and western adaptations. But the most dangerous representative of mystic reaction was the tsar's consort, the Empress Alexandra Feodorovna. Of German descent on her father's side and of English descent on the side of her mother (Princess Alice, the daughter of Queen Victoria), she had received her education in England, but, on coming to Russia, she surrendered completely to the most extreme form of theocratic exaltation.

While her sister, the widow of the Grand Duke Sergius, killed by a terrorist, had devoted herself to a simple life at the head of a community of hospital nurses, Alexandra Feodorovna, highly strung and hysterical, sought providential guidance in the midst of unbalanced women and false prophets like the French medium Philippe and the famous Rasputin. The latter obtained a hold on her through the hypnotising influence he exercised over her son, the tsarevich Alexis, a boy affected by the rare disease of hereditary haemophilia. But the crafty peasant had contrived to obtain gradually a psychical domination over the empress and her friends which made it possible for him to distribute political favours and to have his say in the most important affairs of state. The empress considered him as the God-sent representative of the Russian nation, of that mass of peasants which, as she was convinced, was the firm mainstay of autocracy in Russia. And in the later years of Nicholas II.'s reign, the years of great trial and danger, Alexandra Feodorovna stepped in more and more often to direct the tsar's choice of his ministers and to prevent him from making concessions to the spirit of the time. For the circumstances which brought Russia into the World War see RUSSIA: History.

The suspicion that Alexandra Feodorovna was secretly favour-

ing the cause of Germany and revealing military secrets to the Kaiser—a suspicion often expressed abroad and popularly accepted in Russia—is, according to most competent witnesses, devoid of any basis in fact. The empress was intensely patriotic in her own way, opposed to the aggressive policy of the Hohenzollerns, and never advocated a treacherous compromise with the Central Powers. A former lady-in-waiting, Princess Vassiltchikov, who towards the close of 1916 brought the project of such a compromise from Germany, was promptly ordered out of St. Petersburg (Leningrad). Nevertheless, Alexandra Feodorovna proved to be the evil genius of the Russian dynasty, by her blind and obstinate support of reactionary tendencies and of worthless adventurers, at a time when a wise and firm policy of reform was more needed than ever. All the better representatives of the dynasty—the Dowager Empress, the Grand Duke Nicholas Mikhailovich, the Grand Duchess Victoria—warned her of the imminent danger of that régime of fleeting ministerial shadows which set in after the catastrophe of the War Office in 1915.

The emperor remained passive as commander-in-chief at headquarters while the Empress Alexandra spurned all advice with contempt and continued to pull the strings by dismissing men like Sazonov and Palivanov, and appointing timeservers like Sturmer, Protopopov or Galitzin. The assassination of Rasputin did not frighten but enraged her; she erected a kind of shrine over the body of the prophet and sent the Grand Duke Dmitry Pavlovich, who had taken part in the murder, into exile. Her power was broken only by the revolution.

The thread of the Romanov dynasty was cut without much resistance. When in March 1917 the emperor received at headquarters a telegram from the president of the Duma informing him of the events of St. Petersburg and demanding his abdication, and Gutchkov and Shulgin arrived with the act of abdication itself, he submitted with fatalistic composure. He refused to give up his crown to his son with Grand Duke Michael as regent, because he did not wish to trust the boy to the danger of a political storm; and his abdication was made in favour of the Grand Duke Michael, who in his turn refused to accept the crown unless it was tendered to him by the will of the people. The last chance of a régime of constitutional monarchy was cut short. Proposals were made on behalf of the British Government to allow Nicholas II. and his family to take up their abode in England; but the Provisional Government in St. Petersburg did not accede to that plan. Kerensky and Milyukov declared that the imperial family were in safety in Russia. Later on the emperor submitted meekly to be transferred from Pskov to Tsarskoe Selo and thence to Tobolsk, where he was interned with his family—his wife, his son and his four daughters—for months.

The end came in connection with Kolchak's advance on the Ural in 1918. The Soviet of Commissaries in Moscow enjoined the greatest vigilance to the Ekaterinburg commissar, Yourkovsky, and the commander of the guard, Medvediev, without indicating any means for removing the prisoners from the threatened zone. The communists of Ekaterinburg held a secret meeting in which they decided to put the tsar and his family to death, and sent an order in this sense to Yourkovsky. The latter demanded that it should be duly signed, and 16 signatures were affixed to it. On the night of July 16 Yourkovsky roused the prisoners and conducted them into a cellar of the house. Medvediev, with the Lettish guards, entered the room while some Russian soldiers were looking in from the staircase. Yourkovsky placed the seven doomed persons at one end of the room and read the sentence hurriedly by torchlight. The tsar stepped forward and said something indistinctly, when Yourkovsky drew his revolver and shot him in the head. A general fusillade followed. During the next few days the corpses were removed to an isolated spot in the neighbourhood of Ekaterinburg and destroyed by fire, after having been soaked with petroleum. A few objects of apparel were later picked up on the spot. (See RUSSIA.)

NICHOLAS I. (1841–1921), king of Montenegro, was born at Njeguš, the ancient home of the Njeguš-Petrović dynasty, on Sept. 1, 1841. His father, Mirko Petrović, was brother of the Vladika Danilo II. who had declined episcopal office, married and declared the succession hereditary in the direct male line. As, however, Danilo II. left no male issue, and Mirko declined the succession, Nicholas became heir to the throne of Montenegro. He was educated in Trieste and at the Academy of Louis le Grand in Paris, returning to Montenegro on the assassination of his uncle (Aug. 13, 1860). He took part in the campaign against Turkey of 1862, which, after Austria's intervention, was followed by a prolonged peace. In 1868 he travelled to St. Petersburg (Leningrad) to meet the tsar Alexander II., who received him with favour, and afterwards regularly supplied him with subventions of arms and money, referring to him on a memorable occasion as his "only friend." During the Near Eastern crisis of 1876 (see EASTERN QUESTION), Nicholas declared war on the Porte, and winning brilliant successes in this and the following wars at Vučid, Podgorica and Nikšić, captured Antivari and Dulcigno. The Congress of Berlin (q.v.) brought Montenegro formal recognition as a sovereign State and doubled her area, besides giving her an outlet on the sea at Antivari. Nicholas now entered on a long period of peace largely filled with intrigues with and against his son-in-law, Peter, later King Peter I. of Serbia (q.v.) regarding a possible later Yugoslav state to comprise both Serbia and Montenegro. On Dec. 19, 1900, Nicholas assumed the title of Royal Highness.

In 1905 he was forced by public opinion, which was revolting against his despotic methods, to grant a constitution. He was at once involved in quarrels with his political opponents, culminating in the scandalous but obscure "Cetinje bomb plot" of 1905. On Aug. 28, 1910, encouraged by Austria, who helped to estrange him further from Serbia, Nicholas assumed the title of king. In the Balkan Wars (q.v.) he was the first to declare war on Turkey, but although these wars gave Montenegro an accession of territory, the dynasty lost prestige, its unpopularity and with it the movement for the union of Serbia with Montenegro, increased. In the World War Montenegro threw in her lot with Serbia; Nicholas, however, maintained touch with Austria, from whom he begged a separate peace (Jan. 13, 1916). On Jan. 19, Nicholas fled to Italy and France. The breach widened between him and his people, and the "Great National Assembly" on Nov. 26, 1918, proclaimed his deposition and that of his dynasty. The old ex-king passed the remainder of his days in Italy. He died at Antibes on March 1, 1921.

A rude but often benevolent despot of the fighting type, Nicholas was also a poet of talent. His works include *Balkanska Tsaritsa* and *Knyaz Arvaniti* (dramas); *Haidana*, *Potini Abenserage* and *Pesnik i Vila* (poems), *Skupljene Pesme* and *Nova Kola* (songs). In Nov. 1860, Nicholas married Milena (1847–1923) daughter of the *voivode* Petar Vukotić. On the death of Nicholas, his eldest son Danilo was proclaimed by the small monarchist party king of Montenegro (Mar. 1, 1921), but abdicated on Mar. 7, 1921, in favour of his nephew Michael, eldest son of Prince Mirko (b. Sept. 1, 1908).

NICHOLAS (1856–1929), Russian Grand Duke and soldier. Nikolai Nikolaievich was born on Nov. 6, 1856, the grandson of the emperor Nicholas I. and first cousin of the emperor Alexander III. Educated at the school of military engineers, he received his commission in 1872, and in the following year, at the early age of 16, entered the military academy. In the war of 1877–78, as a general staff officer for special service, he joined the staff of his father, the very popular Grand Duke Nikolai Nikolaievich (Senr.), who had been appointed commander-in-chief of the Russian forces. He distinguished himself at the crossing of the Danube at Zimnicea on April 15, 1877, and in the attack on the Shipka.

After the war the Grand Duke joined the Guard Hussar Regiment, in which the emperor Nicholas afterwards served, and passed through every stage as officer till appointed commander in 1884—a position he occupied for 6½ years. He then commanded in succession a brigade and a division, and in 1895 was appointed

inspector-general of cavalry. He held this post for ten years, a period which is regarded as a bright epoch in the history of the Russian cavalry, for he carried through fundamental reforms in training and in the organization of the cavalry schools, of the cavalry reserves and of the remount service.

In 1905 Nicholas was appointed commander-in-chief of the St. Petersburg military district, a post he held till the outbreak of the World War in Aug. 1914. Here, as elsewhere, he gave proof of his zeal for efficiency. Setting himself the task of instilling the lessons of the Japanese war, he encouraged musketry and work in extended order, but at the same time allowed no slackness in ceremonial. To help him in his work he called from the Far East men like Generals Ivanov, Lesh and Lechitski, who were of comparatively humble origin but had made their reputation in the field. The appointment of such men to high command in the Imperial Guard was characterized in his diary at the time by another grand duke as "revolutionary," but the men selected justified their choice in the World War.

In the same year (1905) as he was appointed commander-in-chief of the St. Petersburg military district, Nikolai Nikolaievich became the first president of the newly created council of national defence, and he held this position till 1908, when the council was abolished. During this time the emperor seems to have hesitated between the final adoption of a military system analogous to that of Germany, under which the chief of the general staff, as well as the minister of war, should have the right of access and of direct report to the sovereign, and of the system in vogue in countries with a constitutional Government, under which that right was confined to the minister of war. On the council the Grand Duke worked in close co-operation with General Palitsin, who, in 1908, on the emperor's decision in favour of the latter system, gave way to General Sukhomlinov as chief of the general staff, the latter, in the following year, replacing General Rediger as minister of war.

From 1908 to 1914 Nicholas took no part in the strategical preparation for the war, the work being delegated by the emperor to General Sukhomlinov and his nominees on the general staff. At the outbreak of war the emperor first intended to take command himself, and actually appointed the grand duke Commander-in-chief of the VI. (Reserve) Army at St. Petersburg (Leningrad). It was only on the evening of Aug. 1, the day of Germany's declaration of war, that he yielded to the entreaties of his ministers and decided to hand over the supreme command to the grand duke.

Services During the War.—The commander-in-chief was responsible for carrying out a plan which he had no hand in drawing up, a plan which was dependent on promises previously made, without his cognisance, to the French general staff. He had to work in accordance with the "Regulations for the Direction of the Army in the Field," a new edition of which had been issued on the very eve of the war, handing over much power to the two group commanders.

The plan of the Russian general staff consisted of the invasion of East Prussia by a right group (I. and II. Armies), while a left group (IV., V., III. and VIII. Armies) operated against the Austrians in Galicia, and a centre group (IX. and X. Armies) assembled at Warsaw to advance on Posen. It was owing to the decision of the grand duke that this centre group was broken up, the X. Army being sent north to fill the gap left by the failure in East Prussia, and the IX. Army sent south to overwhelm the Austrians in southern Poland.

When the Germans came to the rescue of their discomfited ally by advancing in Oct. 1914 to the outskirts of Warsaw, the transfer of the Russian armies from left to right in rear of the Vistula, and the concentration of superior forces on the enemy's left or northern flank which compelled his retreat, were masterly movements. If the next German advance, culminating in the operation of Łódź owing to mistakes by Russian army commanders, definitely removed all possibility of an invasion of Posen, the Russians held on through the winter of 1914-15 to the line of the Narev-Vistula-San-Carpathians, and were only compelled by lack of munitions in the spring and summer of 1915

to retreat to a line that they held substantially through 1916-17.

There was no demand from the fighting men at the front for the change at G.H.Q. which occurred on Aug. 21, 1915, when the emperor announced that he would assume the supreme command. It is said that Rasputin had prophesied that the Russian armies would continue to be defeated till the emperor placed himself at their head. Certainly the impostor had no reason to love the Grand Duke Nicholas. A story repeated among the soldiers relates that he had applied to the commander-in-chief for permission to come to the front "to bless the troops," and the latter had telegraphed in reply two Russian words which being translated run—"Come, I shall hang you."

The grand duke was appointed viceroy and commander-in-chief in the Caucasus. Up to that time the brunt of the fighting against Turkey had been borne by the British in Gallipoli, the Sinai Peninsula and Mesopotamia. The advent of the new commander put new life into the Russian forces. He pushed forward an expeditionary force under General Baratov through Enzeli and Hamadan to screen Persia from further German penetration, and to establish touch with the British troops in Mesopotamia. He collected guns and stores, and raised and trained efficient troops, and, in spite of immense difficulties in supply, ably assisted by Generals Yudenich and Prjvalski, occupied in three successful offensives all Armenia, including the fortress of Erzerum, the port of Trebizond and the town of Erzincan.

The revolution of March 12, 1917, found the grand duke still in the Caucasus. The emperor's last official act was to nominate him to be once more supreme commander-in-chief. His journey from the Caucasian headquarters at Tiflis to the headquarters at Mogilev was in the nature of a triumphal procession, patriotic demonstrations and crowds of people greeting him at every station on the way. Twenty-four hours after his arrival at Mogilev he received a telegram from Prince Lvov, the chief of the provisional Government, cancelling his appointment. The next two years the grand duke spent in the Crimea, taking no part in politics. At last, in March 1919, he left Russian soil on the British cruiser "Marlborough," and lived quietly near Paris. He died in Jan. 1929. (A. W. F. K.)

NICHOLAS, SIR EDWARD (1593-1669), English statesman, was born on April 4, 1593, of a Wiltshire family. He was educated at Salisbury grammar school, Winchester college and Queen's college, Oxford. After studying law at the Middle Temple, Nicholas became secretary to Lord Zouch, warden and admiral of the Cinque ports, in 1618, and continued in a similar employment under the duke of Buckingham. In 1625 he became secretary to the Admiralty; then extra clerk of the privy council with duties relating to Admiralty business, and from 1635 to 1641 he was one of the clerks in ordinary to the council. In this situation Nicholas was concerned with the levy of ship-money. He had Charles's confidence, became a privy councillor and a secretary of State, and attended the king at Oxford, and carried out the business of the treaty of Uxbridge. Nicholas arranged the details of the king's surrender to the Scots, though he does not appear to have approved of the step; and he arranged the capitulation of Oxford. He went to France, and after the king's death he remained on the Continent concerting measures on behalf of the exiled royal family, but he never had any real influence with Charles II. After the Restoration he lived in retirement.

See *The Nicholas Papers*, ed. by G. F. Warner (Camden Society, 1886-97), containing Nicholas's correspondence and some autobiographical memoranda. Private correspondence between Nicholas and Charles I. will be found in the *Memoirs of John Evelyn*, ed. by W. Bray (1827); *The Egerton Mss.* and the *Ormonde Papers* contain many references to Nicholas.

NICHOLAS, NORTHERN or **LENIN LAND** lies in the Arctic sea, about 30 m. N. of Cape Chelyuskin, extending in a north-easterly direction from 77° 50' N., 99° E. to beyond 81° N. The small Alexis (Little Taimir) and Starokadomski islands lie at the eastern end of Alexis strait, which separates Nicholas Land from the mainland. This land was discovered in 1913 by the Russian hydrographical expedition in the "Taimir" and "Vaigach" under B. A. Vilkitski. He took possession for Russia and charted the eastern side. In the following year he returned and

charted the southern coast. The northern and western sides are unknown. The east coast is much indented and a deep gulf or strait occurs in about 79° N. In the south there is a low plain covered with tundra, but on the east the land is lofty (1,500 ft.) and flat-topped with large valley glaciers. Both sedimentary and volcanic rocks occur, but details are lacking. Water of over 100 fathoms depth lies close to the eastern side.

See papers in *Petermann's Mitteilungen*, 60 (1914); *Geographical Journal* (Dec. 1919), and *Geographical Review* (July 1925).

(R. N. R. B.)

NICHOLS, JOHN (1745–1826), English printer and author, was born at Islington on Feb. 2, 1745. He edited the *Gentleman's Magazine* from 1778 till his death, and in that periodical, and in his numerous volumes of *Anecdotes and Illustrations*, he made invaluable contributions to the personal history of English men of letters in the 18th century. He was apprenticed in 1757 to "the learned printer," William Bowyer, who took him into partnership in 1766. On the death of his friend and master in 1777 Nichols published a brief memoir, which afterwards grew into the *Anecdotes of William Bowyer and his Literary Friends* (1782). The *Literary Anecdotes of the 18th Century* (1812–1815), into which the original work was expanded, forms only a small part of Nichols's production. It was followed by the *Illustrations of the Literary History of the 18th Century, consisting of Authentic Memoirs and Original Letters of Eminent Persons*, which was begun in 1817 and completed by his son John Bowyer Nichols (1779–1863) in 1858. He died on Nov. 26, 1826.

Nichols's other works include: *A Collection of Royal and Noble Wills* (1780); *Select Collection of Miscellaneous Poems* (1782), with subsequent additions, in which he was helped by Joseph Warton and by Bishops Percy and Lowth; *Bibliotheca Topographica Britannica* (1780–1790); with Richard Gough, *The Progresses and Public Processions of Queen Elizabeth* (1788); and the *History and Antiquities of the Town and County of Leicester* (8 vols., 1795–1815).

A full memoir of John Nichols by Alexander Chalmers is contained in the *Illustrations*, and a bibliography in the *Anecdotes* (vol. vi.) is supplemented in the later work. See also R. C. Nichols, *Memoirs of J. G. Nichols* (1874).

NICHOLS, ROBERT MALISE BOWYER (1893–), English poet and writer, the son of J. B. B. Nichols, also a poet, was born on Sept. 6, 1893, and educated at Winchester and at Trinity college, Oxford. In 1914 he obtained a commission in the Royal Field Artillery, and served in France until 1916. From 1918 to 1919 he was engaged on propaganda work in the United States for the Ministry of Information. From 1921 to 1924 he was professor of English literature at the Imperial college, Tokyo. His first volume of poetry, *Invocation*, appeared in 1916. In addition to his poetry, he has written *The Smile of the Sphinx* (1920) and contributed to *The London Mercury* and other periodicals.

His published work includes *Ardours and Endurances* (1917); *The Budded Branch* (1918); *Aurelia* (1920); *Guilty Souls* (drama) (1922); *Fantastica* (1923).

NICHOLSON, JOHN (1822–1857), Anglo-Indian soldier and administrator, son of Alexander Nicholson, a north of Ireland physician, was born on Dec. 11, 1822, and educated at Dungannon College. He was presented with a cadetship in the Bengal infantry in 1839 by his uncle Sir James Hogg, and served in the first Afghan War of 1839–42; he distinguished himself in the defence of Ghazni, and was one of the prisoners who were carried to Bamian and escaped by bribing the guard upon General Pollock's successful advance. In Afghanistan Nicholson first met Sir Henry Lawrence, who got him the appointment of political officer in Kashmir and subsequently on the Punjab frontier. In 1847 he was given charge of the Sind Sagar district, and did much to pacify the country after the first Sikh War. On the seizure of Multan by Mulraj, he rendered great service in securing the country from Attock, and was wounded in an attack upon a tower in the Margalla Pass, where a monument was subsequently erected to his memory. On the outbreak of the second Sikh War he was appointed political officer to Lord Gough's force, when he rendered great service in the collection of intelligence and in furnishing supplies and boats.

On the annexation of the Punjab he was appointed deputy

commissioner of Bannu. There he became a kind of legendary hero, and many tales are told of his stern justice, his tireless activity and his commanding personality. In the course of five years he reduced the most turbulent district on the frontier to such a state of quietude that no crime was committed or even attempted during his last year of office, a condition of things never known before or since. He would go personally to the scene of a crime or a legal dispute and decide the question on the spot. Every man in his district, whether mountain tribesman or policeman, felt that he was controlled by a master hand, and the natives said of him that "the tramp of his war-horse could be heard from Attock to the Khyber." It is little wonder that the natives worshipped him as a god under the title of Nikalsain.

When the Mutiny broke out in May 1857 Nicholson did more than any other single man to keep the Punjab loyal and to bring about the fall of Delhi. When the news of the rising at Meerut arrived, Nicholson was with Edwardes at Peshawar, and they took immediate steps to disarm the doubtful regiments in that cantonment. Together they opposed John Lawrence's proposal to abandon Peshawar, in order to concentrate all their strength on the siege of Delhi. In June Nicholson was appointed to the command of a movable column, with which he again disarmed two doubtful regiments at Phillaur. In July he made a forced march of 41 m. in a single day in the terrific heat of the Punjab summer, in order to intercept the mutineers from Sialkot, who were marching upon Delhi. He caught them on the banks of the Ravi near Gurdaspur, and utterly destroyed them, thus successfully achieving what hardly any other man would have attempted. In August he had pacified the Punjab and was free to reinforce General Wilson on the Ridge before Delhi.

Before Nicholson's arrival the counsels of the commanders before Delhi, like those at Meerut, suffered from irresolution and timidity. As General Wilson's health declined, his caution became excessive, and Nicholson was specially sent by Sir John Lawrence to put more spirit into the attack. His first exploit after his arrival was the victory of Najafgarh, which he won over the rebels who were attempting to intercept the British siege train from Ferozepore. After marching through a flooded country scarcely practicable for his guns, Nicholson, with a force of 2,500 troops, defeated 6,000 disciplined sepoys after an hour's fighting, and thenceforth put an end to all attempts of the enemy to get in the rear of the British position on the Ridge. Nicholson grew fiercely impatient of General Wilson's procrastination, and at one time was thinking of appealing to the army to set Wilson aside and elect a successor; but at last, on Sept. 13, he forced Wilson to make up his mind to the assault, and he himself was chosen to lead the attacking column. On the morning of the 14th, he led his column, 1,000 strong, in the attack on the Kashmir gate, and successfully entered the streets of Delhi. But in trying to clear the ramparts as far as the Lahore Gate, he undertook a task beyond the powers of his wearied troops. In encouraging them as they hesitated, he turned his back on the enemy and was shot in the back. The wound was mortal; he died on Sept. 23.

His best epitaph is found in the words of Sir John Lawrence's Mutiny Report:—

Brigadier-General John Nicholson is now beyond human praise and human reward. But so long as British rule shall endure in India, his fame can never perish. He seems especially to have been raised up for this juncture. He crowned a bright, though brief, career by dying of the wound he received in the moment of victory at Delhi. The Chief Commissioner does not hesitate to affirm that without John Nicholson Delhi could not have fallen.

See J. L. Trotter, *Life of John Nicholson* (1904); Sir John Kaye, *Lives of Indian Officers* (1889); Bosworth Smith, *Life of Lord Lawrence* (1883); Lady Edwardes, *Memoirs of Sir Herbert Edwardes* (1886); and S. S. Thorburn, *Bannu* (1826).

NICHOLSON, JOSEPH SHIELD (1850–1927), British economist, son of an Independent minister, was born on Nov. 9, 1850 at Wrawby in Lincolnshire, and educated at Edinburgh university and Trinity college, Cambridge, where he won the Cobden Prize in 1877 (the first award), and again in 1880. After studying at Heidelberg and at London university, he became a private tutor at Cambridge.

In 1880 he went to Edinburgh university as professor of political economy. He wrote more than twenty volumes on economics, of which the chief are: *The Silver Question* (1886); *Money and Monetary Problems* (1888); *Bankers' Money* (1903); *The Tariff Question* (1903); *The History of the English Corn Laws* (1903); *Project of Empire* (1909); and *Principles of Political Economy* (3 vols., 1893, 1897, 1901). In all his economic writings he advocated the principles of Adam Smith, of whom he was a fervent disciple. He resigned his chair in 1925, and died in Edinburgh on May 12, 1927.

NICHOLSON, MEREDITH (1866–), American writer, was born at Crawfordsville (Ind.), Dec. 9, 1866, and educated in the public schools of Indianapolis. He was a reporter and later editor on the *Indianapolis News*, and has been the recipient of various honorary degrees.

He has published the following novels: *The Main Chance* (1903), *The House of a Thousand Candles* (1905), *The Port of Missing Men* (1907), *The Little Brown Jug at Kildare* (1908), *The Lords of High Decision* (1909), *A Hoosier Chronicle* (1912), *The Poet* (1914), *And They Lived Happily Ever After* (1925); also *Poems* (1906); and several volumes of historical and critical essays, among them *The Hoosiers* (1900) and *The Valley of Democracy* (1918).

NICHOLSON, WILLIAM (1753–1815), English writer on natural philosophy, was born in London in 1753. Nicholson occupied himself with writing and lecturing on natural philosophy, including chemistry, and with the construction of various machines and the first voltaic pile in England. In 1797 the *Journal of Natural Philosophy, Chemistry and the Arts*, generally known as *Nicholson's Journal*, the earliest work of the kind in Great Britain, was begun; it was carried on till 1814. He died in London on May 21, 1815.

Besides contributions to the *Philosophical Transactions*, Nicholson wrote translations of Fourcroy's *Chemistry* (1787) and Chaptal's *Chemistry* (1788), *First Principles of Chemistry* (1788) and a *Chemical Dictionary* (1795); he also edited the *British Encyclopaedia*, or *Dictionary of Arts and Sciences* (6 vols., 8vo, London, 1809).

NICHOLSON, WILLIAM (1872–), English painter, engraver and illustrator, was born at Newark-on-Trent in 1872. He first became known to the wider public by his illustrative work in *An Alphabet, An Almanack of Sports* (with Rudyard Kipling), and *London Types* (with W. E. Henley) in 1898; by the "Portrait of Queen Victoria," a delightful coloured wood engraving, the *Velveteen Rabbit* with its clever end-papers, and by the whole series of quaint and witty books and posters which he produced in collaboration with his brother-in-law, James Pryde (as "the Beggarstaff Brothers"). His more serious work is found in his painting, whether dealing with a portrait, a landscape, or still-life. Among his paintings in oil are "The Black Pansy," "The Landlord" (Manchester City Art gallery), "The Girl with the Tattered Gloves," "Fish," and the portraits of "Marie Tempest," "Ursula Lutyens" and "The Master of Jesus." Other works are the "Square Book of Animals" and the "Buildings of Oxford."

See monograph in *Contemporary British Artists*, by S. K. North (1923).

NICHOLSON'S NEK: see SOUTH AFRICAN WAR.

NICIAS (d. 414 B.C.), a soldier and statesman in ancient Athens, inherited from his father Niceratus a considerable fortune invested mainly in the silver mines of Laurium. Evidence of his wealth is found in the fact that he had no less than 1,000 slaves whom he hired out. He was several times colleague with Pericles in the strategia, and on Pericles' death became the leading advocate of the Periclean policy of pinpricks (*ἐπιτροχισμοί*) and concentration on the Thracian region against the offensive policy of the democrats under Cleon. At the amphibious tactics of the *ἐπιτροχισμός* he was unsurpassed. Having been largely responsible for the "Peace of Nicias" (421) he appears in the rather obscure history of the following years as the leader of the peace party, in opposition to Alcibiades. In 415 much against his will, he was appointed leader of the Sicilian expedition with Alcibiades and Lamachus, and the recall of Alcibiades, followed by the death of Lamachus, left him in sole command. Demosthenes came out with reinforcements early in 413, and took charge for a brief space, but at the end the main responsibility for the delay, and so perhaps for the disaster, rests with Nicias.

He was put to death during that year by the Syracusans.

Besides Thucydides see Plutarch's *Nicias* and Diod., xii. 83; also GREECE, and PELOPONNESIAN WAR.

NICKEL (symbol Ni, atomic number 28, atomic weight 58.69, isotopes 58 and 60), a greyish-white metallic element of considerable malleability and ductility. It has been known from the earliest times, being employed by the Chinese in the form of an alloy called pakfong. It was first isolated in an impure condition in 1751 by A. F. Cronstedt from nicolite, and his results were afterwards confirmed by T. O. Bergman in 1775 (*De niccolo*, *opusc.* 2, p. 231; 3, p. 459; 4, p. 374). It occurs in the uncombined condition and alloyed with iron in meteorites; as sulphide in millerite and nickel blende, as arsenide in kupfernickel, and frequently in combination with arsenic and antimony in the form of complex sulphides. It is found in considerable quantities in New Caledonia in the form of a hydrated silicate of nickel and magnesia approximating to the constitution $(\text{NiO}, \text{MgO})\text{SiO}_3 \cdot n\text{H}_2\text{O}$, and in Canada in the form of nickeliferous pyrrhotines, which consist of sulphides of iron associated with sulphides of nickel and copper, embedded in a matrix of gneiss; these form the chief sources of nickel. When the former is used it is roasted with calcium sulphate or alkali waste to form a matte which is then blown in a Bessemer converter or heated in a reverberatory furnace with a siliceous flux with the object of forming a rich nickel sulphide. This sulphide is then by further heating converted into the oxide and finally reduced to the state of metal by ignition with carbon in clay crucibles. The process adopted for the Canadian ores, which are poor in copper and nickel, consists in a preliminary roasting in heaps and smelting in a blast furnace in order to obtain a matte, which is then further smelted with a siliceous flux for a rich matte. This matte is then mixed with coke and salt-cake and melted down in an open hearth furnace, or in a Bessemer converter with a silicate lining.

In the Mond process, this refined matte, which contains copper, nickel and iron sulphides, is roasted to remove the sulphur, and extracted by sulphuric acid, whereby the iron and copper contents are diminished and the nickel content is relatively increased. Reduction by "water-gas" at 300° C. then leaves nickel and copper as metals and iron oxide unaffected; at the same time, the water-gas is largely deprived of its hydrogen and becomes relatively richer in carbon monoxide, the content of which is raised to 80% by passage through a retort of hot coke. This enriched gas is then passed over the metallic mixture at about 80° C., whereby the nickel is "volatilised" as the carbonyl $\text{Ni}(\text{CO})_4$; the product is passed through towers at 180–200° C., where it decomposes and is deposited (often on pellets of pure nickel), the resulting carbon monoxide being used again. The nickel so obtained is of a high degree of purity.

The following tables show the output of nickel from Canada and the shipments of nickel ore from New Caledonia in recent years as metric tons:—

	Canada	New Caledonia
1913	22,539	164,406
1918	41,960	90,650
1923	28,329	3,520
1925		4,447
1926	29,817	

The metal may also be obtained on the small scale by the reduction of the oxide by hydrogen or by carbon, by ignition of the oxalate or of nickel ammonium oxalate by reduction of the chloride in a current of hydrogen (E. Péligot), by electrolysis of nickel ammonium sulphate, as in the process of nickel plating.

Its specific gravity varies according to the method employed for its preparation, being about 8.8. It melts at 1,452° C. Its specific heat increases with rise of temperature, the mean value from 15° to 100° C. being 0.1084. It is magnetic, but loses its magnetism when heated, the loss being complete at about 340–350° C. Nickel occludes hydrogen readily, is attacked by the halogen elements, and oxidizes easily when heated in air. In the massive state it is unacted upon by dry air, but if moistened with acidified water, oxidation takes place slowly. When obtained by reduction

processes at as low a temperature as possible the finely divided metal so formed is pyrophoric, *i.e.*, it may ignite spontaneously in the air. It decomposes water at a red heat. Sheet nickel is passive to fairly concentrated nitric acid, and the metal remains passive even when heated to redness in a current of hydrogen. Nickel is largely used as a catalyst for the reduction of organic compounds by hydrogen—a process first used by P. Sabatier and J. B. Senderens (*see* HYDROGEN and HYDROGENATION).

It rapidly oxidizes when fused with caustic soda, but is scarcely acted upon by caustic potash. Hydrochloric and sulphuric acids are almost without action on the metal, but it dissolves readily in dilute nitric acid. Nickel salts are antiseptic; they arrest fermentation and stop the growth of plants. Nickel carbonyl, however, is extremely poisonous. On the toxic properties of nickel salts *see* A. Riche and Laborde, *Jour. Pharm. Chem.*, 1888 (5), 17, pp. 1, 59, 97.

Nickel is used for the manufacture of domestic utensils, for crucibles, coinage, plating and for the preparation of various alloys, such as German silver, nickel steels such as invar (nickel, 35.7%; steel, 64.3%), which has a negligible coefficient of thermal expansion, and constantan (nickel, 45%; copper, 55%), which has a negligible thermal coefficient of electrical resistance.

COMPOUNDS

Nickel Oxides.—Several oxides of nickel are known. The *monoxide*, NiO, occurs naturally as bunsenite, and is obtained artificially when nickel hydroxide, carbonate, nitrate or sulphate is heated. It may also be prepared by the action of nickel on water, by the reduction of the oxide Ni_2O_3 with hydrogen at about 200°C ., or by heating nickel chloride with sodium carbonate and extracting the fused mass with water. It is a green powder which becomes yellow when heated. It dissociates at a red heat, and is readily reduced to the metal when heated with carbon or in a current of hydrogen. It is readily soluble in acids, forming salts. The *hydroxide*, $\text{Ni}(\text{OH})_2$, is obtained in the form of a greenish amorphous powder when nickel salts are precipitated by the caustic alkalis. It is readily soluble in acids and in an aqueous solution of ammonia. Nickel sesquioxide, Ni_2O_3 , is formed when the nitrate is decomposed by heat at the lowest possible temperature. It is a black powder, the composition of which is never quite definite, but approximates to the formula given above. When heated with oxyacids it dissolves, with evolution of oxygen, and with hydrochloric acid it evolves chlorine. Numerous hydrated forms of the oxide have been described. A *peroxide*, NiO_2 , has been obtained as a salt of barium, $\text{BaO} \cdot 2\text{NiO}_2$, by heating the monoxide with anhydrous baryta in the electric furnace. G. Pellini and D. Meneghini obtained a greyish green powder by adding an alcoholic solution of potassium hydrate to nickel chloride and hydrogenperoxide at -50° . It has all the reactions of hydrogenperoxide and S. Tanatar regards it as $\text{NiO} \cdot \text{H}_2\text{O}_2$. An oxide, Ni_3O_4 , has been obtained by heating nickel chloride in a current of moist oxygen at about 400°C ., or by heating the sesquioxide in hydrogen at 190°C . The former method yields greyish, metallic-looking, microscopic crystals, the latter a grey amorphous powder. A hydrated form, $\text{Ni}_3\text{O}_4 \cdot 2\text{H}_2\text{O}$, is obtained when the monoxide is fused with sodium peroxide at a red heat, and the fused mass extracted with water.

Nickel Salts.—Only one series of salts is known, namely those corresponding to the monoxide. In the anhydrous state they are usually of a yellow colour, whilst in the hydrated condition they are green. They may be recognized by the brownish violet colour they impart to a borax bead when heated in an oxidizing flame. The caustic alkalis added to solutions of nickel salts give a pale green precipitate of the hydroxide, insoluble in excess of the precipitant. This latter reaction is hindered by the presence of many organic acids (tartaric acid, citric acid, etc.). Potassium cyanide gives a greenish yellow precipitate of nickel cyanide, $\text{Ni}(\text{CN})_2$, soluble in excess of potassium cyanide, forming a double salt, $\text{Ni}(\text{CN})_2 \cdot \text{KCN}$, which remains unaltered when boiled with excess of potassium cyanide in presence of air (*cf.* COBALT). Ammonium sulphide precipitates black nickel sulphide, which is somewhat soluble in excess of the precipitate (especially if yellow ammonium sulphide be used), forming a dark-coloured solution. Ammo-

nium hydroxide gives a green precipitate of the hydroxide, soluble in excess of ammonia, forming a blue solution. Numerous methods have been devised for the separation of nickel and cobalt, the more important of which are:—the cobaltinitrite method in which the cobalt is precipitated in the presence of acetic acid by means of potassium nitrite (the alkaline earth metals must not be present); the cyanide method, in which the two metals are precipitated by excess of potassium cyanide in alkaline solution, bromine being afterwards added and the solution warmed, when the nickel is precipitated; the dimethyl glyoxime method, whereby nickel is precipitated as $\text{Ni}(\text{C}_2\text{H}_5\text{O}_2\text{N}_3)_2$, a scarlet flocculent compound stable at 120°C . Similar separations are based on the insoluble cobalt compound of nitroso- β -naphthol, $\text{C}_{10}\text{H}_7(\text{NO}) \cdot \text{OH}$, and on the insoluble compound $\text{Ni}(\text{C}_2\text{H}_5\text{ON})_2 \cdot 2\text{H}_2\text{O}$, formed by nickel with dicyanodi-amidine.

Nickel Fluoride, NiF_2 , obtained by the action of hydrofluoric acid on nickel chloride, crystallizes in yellowish green prisms which volatilise above $1,000^\circ\text{C}$. It is difficultly soluble in water, and combines with the alkaline fluorides to form double salts. *Nickel chloride*, NiCl_2 , is obtained in the anhydrous condition by heating the hydrated salt to 140°C ., or by gently heating the finely divided metal in a current of chlorine. It readily sublimes when heated in a current of chlorine, forming golden yellow scales. It is easily reduced when heated in hydrogen. It forms crystalline compounds with ammonia and the organic bases. It is soluble in alcohol and in water. Three hydrated forms are known, *viz.*, a mono-, di- and hexa-hydrate, the last being the form usually obtained by the solution of the oxide or carbonate in hydrochloric acid. *Nickel chloride ammonia*, $\text{NiCl}_2 \cdot 6\text{NH}_3$, is obtained as a white powder when anhydrous nickel chloride is exposed to the action of ammonia gas, or in the form of blue octahedra by evaporating a solution of nickel chloride in aqueous ammonia. When heated to 100°C . it loses four molecules of ammonia (*see* AMMINES). Numerous double chlorides of nickel and other metals are known. The *bromide* and *iodide* of nickel resemble the chloride and are prepared in a similar fashion.

Several sulphides of the element have been obtained. The monosulphide, NiS , is obtained by heating nickel with sulphur, by heating the monoxide with sulphuretted hydrogen to a red heat, and by heating potassium sulphide with nickel chloride to 160 – 180°C . When prepared by dry methods it is an exceedingly stable, yellowish, somewhat crystalline mass. When prepared by the precipitation of nickel salts with alkaline sulphide in neutral solution it is a greyish black amorphous compound which readily oxidizes in moist air, forming a basic nickel sulphate. The freshly precipitated sulphide is somewhat soluble in hydrochloric acid and yellow ammonium sulphide. Nickel sulphate, NiSO_4 , is obtained anhydrous as a yellow powder when any of its hydrates are heated. When heated with carbon it is reduced to the metal. It forms hydrates containing one, two, five, six and seven molecules of water. The heptahydrate is obtained by dissolving the metal or its oxide, hydroxide or carbonate in dilute sulphuric acid (preferably in the presence of a small quantity of nitric acid), and allowing the solution to crystallize between 15° and 20°C . It crystallizes in emerald green rhombic prisms and is moderately soluble in water. It effloresces gradually on exposure to air and passes into the hexahydrate. It loses four molecules of water of crystallization when heated to 100°C . and becomes anhydrous at about 300°C . Nickel sulphate combines with many metallic sulphates to form double salts, and also forms additional compounds with ammonia, aniline and hydroxylamine. The *nitrate*, $\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$, is obtained by dissolving the metal in dilute nitric acid and concentrating the solution between 40° and 50°C . It crystallizes in green prisms which deliquesce rapidly on exposure to moist air.

Nickel Carbonyl, $\text{Ni}(\text{CO})_4$, is obtained as a colourless mobile liquid by passing a carbon monoxide over reduced nickel, at a temperature of about 80°C . (*see* above). It boils at 43°C . (751 mm.), and sets at -25°C . to a mass of crystalline needles. It is readily soluble in hydrocarbon solvents, in chloroform and in alcohol. Its critical pressure is 30 atmospheres and its critical temperature is in the neighbourhood of 195°C . It decomposes

with explosive violence when heated rapidly, and is decomposed by the halogens (dissolved in carbon tetrachloride) with liberation of carbon monoxide and formation of a nickel halide. With aromatic hydrocarbons in the presence of anhydrous aluminium chloride, in the cold, there is a large evolution of hydrochloric acid gas, and an aldehyde is formed; at 100° C., on the other hand, anthracene derivatives are produced. Thus by using benzene, benzaldehyde and anthracene are obtained. Nickel carbonate, NiCO_3 , is obtained in the anhydrous state by heating nickel chloride with calcium carbonate in a sealed tube to 150° C. It crystallizes in microscopic rhombohedra insoluble in cold acids. By precipitation of nickel salts with solutions of the alkaline carbonates, basic carbonates of variable composition are obtained. (X.)

PRODUCTION

The world's chief source of nickel is Canada: in 1913 she contributed 69% of the world's production. The heavy World War demand caused the Canadian output to increase, and by 1918 it had risen from 20,000 tons in 1914 to 41,000 tons in 1918, which latter figure represented 87% of the world's production for that year. The highest percentage was reached in 1920, when Canada produced 88% of the world's supply. As a result of the market being congested with large stocks and accumulated scraps at the end of the war, Canadian production declined, reaching its lowest ebb in 1922, when less than 8,000 tons of Canadian nickel were mined. When the congested supplies had been absorbed, the industry quickly revived; demand soon exceeded production, and a steadily increasing output has since been maintained. The world's output in 1923 was estimated at about 30,000 tons, of which approximately 27,000 tons were produced from the nickel mines in Canada, including a relatively small quantity of nickel recovered as a by-product from the cobalt-silver ores in that Dominion.

With regard to foreign producers of nickel, the most important is the island of New Caledonia, a French possession about 1,250 m. north-east of Australia. This island's output, in spite of the increased demand for the metal between 1914 and 1918, has since then gradually fallen, being in 1921 only about 14% of the world's output. Norway, which in the earliest days of the industry held a monopoly of the world's supply, closed down her mines in 1921 for economic reasons. In the United States the nickel deposits are nowhere being worked for the metal, though a small quantity is incidentally recovered there each year in the process of electrolytic refining of blister copper. Under the exigencies of war Germany produced from her own low-grade mines a small tonnage of nickel ore, but since the close of hostilities she has reverted to the practice of importing refined metal. Besides the above, there have been obtained from time to time small supplies of ore from Greece, Tasmania, Sweden, etc.

Practically the whole of the Canadian output is obtained from the Sudbury district in the Province of Ontario, relatively small quantities being obtained from the deposits 150 m. due north of Sudbury in the Temiscaming district, and from the cobalt-silver area in the same province. Other occurrences are known in the townships of MaCart, Munro, Strathy and near Lake Shebendowan in the district of Thunder Bay, Ontario, and nickeliferous

pyrrhotite associated with copper occurs in the Gabbro copper mines, Vancouver Island, British Columbia.

For nickel plating see ELECTRO-PLATING.

NICKEL-CHROMIUM STEEL, an alloy of iron, nickel, chromium and carbon. Nickel strengthens the alloy and increases its toughness. Chromium unites first with the carbon to form complex carbides, and forms a material that, after quenching even at a slow rate, is hard both at the surface and inside. The two elements in one steel seem to intensify these respective effects, and after proper heat treatment produce unexampled alloys, strong, hard, tough, with great resistance to shock, penetration and repeated stresses. Nickel-chromium steel for armour plate is made as follows: a steel ingot containing 0.40% carbon, 3.75 to 4.0 nickel and 1.5 to 2.0 chromium after forging into a thick slab is placed in a carbonizing furnace, covered with a pile of charcoal and heated for several days until the steel at the surface has absorbed an additional 1% carbon, gradually tapering off to the original content at a depth of about 1½ inches. It is later given a complex heat treatment designed to produce maximum toughness at the back and maximum hardness at the carbonized surface. Even more intricate and skilful heat treatment is required for armour-piercing shells, with their glass hard piercing point (often protected by a soft wrought iron cap) and a tough body which will retain its shape and contents of high explosive even after passing through a 12 in. plate. Such alloy steels must be very carefully made of clean raw materials—acid open-hearth and electric furnaces are preferred (although American armour is usually basic steel). Since chromium is oxidized readily, and its oxides are quite detrimental to the steel, the ferro-chromium is added near the end of the heat after the bath has been thoroughly deoxidized. Ingots are cast of cool metal, stripped and placed in soaking pits as soon as possible. Air-hardening steels such as these are "tender" in the ingot; surface cracks are frequent and must be carefully chipped out of the billet. Reheating of large masses must be very deliberate to avoid interior cracks.

Nickel-chromium steels now hold first place in use in the United States for important parts which are to be case-hardened, or for highly stressed forgings. About 2½ times as much nickel as chromium seems to withstand best the normal variations in commercial heat treatments. Some 15 analyses current in the United States fall within the following ranges:—

World's Production of Nickel Ore
Long Tons

	1913	1918	1923†	1925
Canada	22,177	41,208	27,881	32,972***
Germany	267	1,841	3**	..
Greece	943	658
Norway	492	238	61	..
Sweden	24
New Caledonia* . .	8,008	2,666	2,624	3,320
United States† . .	214	394	89	243

*Exports.

†Produced as by-product in electrolytic refining of copper.

**Ore, nickel content not stated.

††Italy produced 44 tons in this year and 6 tons in 1925.

***This figure is not comparable with the preceding columns owing to the adoption of a new method of computing the metal content of ores.

	Society of Automotive Engineers' Code No.	Chemical analysis		
		Carbon	Nickel	Chromium
	series			
Low alloy	3,100	0.10 to 0.45	1.0 to 1.5	0.45 to 0.75
Medium alloy	3,200	0.10 to 0.55	1.5 to 2.0	0.90 to 1.25
High alloy	3,300	0.07 to 0.45	3.25 to 3.75	0.25 to 1.75

During carburization of a nickel-chromium steel the carbon penetrates deeper than into a plain carbon steel or into simpler alloys. The gradation in carbon content from surface to interior is gradual, and thus avoids cracked or spalled surfaces during heat treatment or use. It is important that all nickel-chromium steels be cooled quickly after the drawing heats; air or furnace cooling is liable to cause them to lose their toughness.

Series 3100 with carbon about 0.35% is used for high quality

forgings, because it can be water quenched from a fairly wide temperature range and is somewhat cheaper than the 3½% nickel steel (*q.v.*). After a deliberate drawing operation such forgings machine easily and uniformly. Principal uses are for automobile steering knuckles, connecting rods, crank and drive shafts, axes, chisels and locomotive and car axles. Physical properties of medium size forgings after the respective draws are:

	Drawn at 600° F	Drawn at 900° F	Drawn at 1,200° F
Ultimate strength, lb. per sq. in.	230,000	165,000	115,000
Elastic limit, lb. per sq. in.	200,000	145,000	95,000
Elongation, per cent	10	15	22
Reduction in area per cent	32	50	61
Brinell hardness	430	320	230

The excellence of these steels is more than is indicated in the above table, for they have great toughness against repeated shock.

Heat-treated castings have given satisfaction when made of about 0.45% carbon, 2.6 nickel and 0.75 chromium. They can compete with cast manganese steel for street railroad crossings and special track-work because they are about as durable under traffic, cheaper and can be machined in the usual way. Joints can be welded satisfactorily with thermit and the battered points rebuilt by fusion welding. An important European use of such material in hardened and tempered condition is for railroad car couplings.

Since 1925 a considerable demand has arisen from the chemical industry for metals which will withstand corrosive action at high heat and pressure when used in the synthesis of nitrates or solvents, and for gasoline "cracking." Among other materials used for such service are the following austenitic nickel-chromium steels:

Chemical composition			Izod impact strength ft.-lb.
Carbon	Nickel	Chromium	
0.15 . . .	10.9	14.8	110
0.14 . . .	7.9	18.1	110
0.25 . . .	5.8	21.0	84

Such materials are noted for great toughness and easy workability; they are permanently soft, and do not air harden after any local heating during fabrication or use. They resist scaling at high temperature well, but if they must bear heavy loads at high heats, tungsten is added to their composition. (See ALLOYS; IRON AND STEEL.) (E. E. T.)

NICKEL SILVER. An alloy of nickel, copper and zinc, also known as German silver or argentan. The proportions of the three metals used in the alloy vary greatly in different grades, a good quality, as specified by a British government department, having 19% nickel, 59% copper and 22% zinc. Nickel silver is used as the base of the best silver-plated ware, and is also used unplated for cheap table-ware and ornaments.

NICKEL STEEL, an alloy of iron, carbon and nickel; nickel primarily conferring toughness. Research and experience gained with ordnance steels resulted in the present large use of alloy steels for making case hardened parts, for high strength castings, boiler plate, bridge steel, forgings and for special electrical alloys. High grade nickel steel is made in the acid open-hearth furnace. Nickel oxide is not stable at any stage of the process, consequently nickel in the scrap steel charged is completely recovered and the shot nickel needed for correct analysis may also be added at any time. In the World War many firms had difficulty in making this steel in basic open-hearth furnaces, probably due to inclusions of oxide particles. Surface conditions of a nickel steel ingot, slab and forging are especially important. Smooth ingot moulds with fluted walls, scrupulously clean, filled without splashing of the metal, and with hot tops are necessary to avoid later trouble. Ingots are stripped as soon as solidified and placed immediately in a hot soaking pit. The billet or slab must be cleaned during rolling of an unusually adherent scale by water sprays, salt or water-soaked burlap caught between the rolls and the hot metal. Billets are

cooled, any surface defects chipped out, then reheated slowly in a smoky flame and rolled to final dimensions. Boiler plate or structural steel to be used without heat treatment must be finished slightly above the transformation range, and slowly cooled in a pile protected from drafts. Steel forgings with 3½% nickel should be sand-blasted, pickled or machined all over before final heat treatment if uniform hardness at the surface is a requisite.

Nickel (*a*) forms a solid solution with either gamma or alpha iron; (*b*) strengthens and toughens this solid solution; (*c*) slows down the speed of the carbon reactions, and reduces the temperature at which they occur; (*d*) refines the grain in quenched and tempered steel; (*e*) prevents grain growth at elevated temperature. These effects are a desirable combination in the use of nickel steels for case-hardening purposes. The following represent the wide range of these steels used in the United States:—

	Low nickel		Medium nickel	High nickel
	A	B	C	D
	%	%	%	%
Carbon . . .	0.10-0.20	0.15	0.10-0.20	Max 0.17
Manganese . . .	0.30-0.60	0.30-0.60	0.30-0.60	0.30-0.60
Nickel . . .	0.40-0.60	1.25-1.75	3.25-3.75	4.50-5.25
Molybdenum . . .		0.25		

Steel A is used for parts requiring moderate quality; oil quenching from the carbonizing pot will give a tough core and a file-hard case. Steel B is given a complex heat treatment and used for roller bearing races. Steel C is used for important and highly stressed parts, such as clash gears and cam shafts, and is heat-treated in a variety of ways depending upon the required combination of surface hardness, toughness of core and constancy of dimension. Steel D is hard to work, either hot or cold, but after proper case hardening gives gears and like parts having extreme hardness and resistance to shock.

Probably a greater tonnage of steel containing 3 to 3.5% nickel and 0.20 to 0.55% carbon is made than any other class of alloy; it goes into heat-treated forgings, heat-treated castings and high strength structural and boiler steels. A 0.45% carbon, 3.5% nickel steel forging of moderate size oil quenched from 1,450° F will have the following properties after the respective draws:—

	Drawn at 600° F	Drawn at 900° F	Drawn at 1,200° F
Ultimate strength . . .	230,000	160,000	118,000
Elastic limit . . .	210,000	150,000	100,000
Elongation in 2 inches . . .	13	18	25
Reduction of area . . .	43	57	63
Brinell hardness . . .	450	320	240

Annealed eye-bar tension members (carbon 0.37%, nickel 3.3%) were first used in 1902 on a cantilever bridge across the East river, New York. The physical properties of this material in 16 by 2½ in. bars were:—

	Specified minimum	Average
Ultimate strength . . .	85,000	95,000
Elastic limit . . .	45,000	55,000
Elongation in 8 inches . . .		23
Elongation in 18 feet . . .	9	

Design stresses on this bridge were 30,000 lb. per square inch; 50% more than customary for regular carbon steel eye-bars. Structural shapes with slightly lower carbon have been used in many long bridges since then.

High-pressure locomotive boilers of nickel steel are used on Canadian and American railroads. Properties in comparison with plain carbon steel boiler plate follow:—

Physical properties	Nickel steel	Carbon steel
Ultimate strength, lb. per sq. in. . .	77,880	59,200
Yield point, lb. per sq. in. . .	47,550	36,200
Elongation in 8 in. per cent . . .	26.3	28.6
Izod impact, ft.-lb. . .	63.4	

Some high nickel alloys with iron have interesting properties. "Platinite" (46% nickel) has the same coefficient of expansion as glass, and is used for lead-in wires in electric light globes and radio tubes. "Nickeloy" (50% nickel) has high magnetic permeability, and is used for radio transformer cores. Permalloy (78% nickel) is discussed under TELEPHONE; and ALLOYS. Invar (35% nickel) is treated under INVAR. (See MANGANESE STEEL; ALLOYS; IRON AND STEEL.) (E. E. T.)

NICOBAR ISLANDS, a British group of twelve inhabited and seven uninhabited islands in the Bay of Bengal, between Sumatra and the Andaman Islands, to which latter they are administratively appended. They have an aggregate area of about 2,508 sq.m., Great Nicobar (*Loöng*), the largest and southernmost of any size, covering 333 sq.m. A careful census of the natives, taken by R. F. Lowis in 1911, gave a total population of 8,818. Car Nicobar (*Pu*), the most northerly island, with an area of 49 sq.m., was by far the most densely populated. The marine surveys of these islands are still meagre and unsatisfactory, but the whole of the Nicobars and outlying islands were surveyed topographically by the Indian Survey Department in 1886-1887. Some of the islands have mere flat, coral-covered surfaces; others, again, are hilly, the Great Nicobar rising to 2,105 ft. On that island there are considerable and beautiful streams, but the others generally are badly off for fresh surface water. There is one good harbour, a magnificent land-locked shelter called Nankauri Harbour.

Geology.—The Nicobars form part of a great submarine chain, of which the Andamans are a continuation. Elaborate geological reports were issued by a Danish scientific expedition in 1846 and an Austrian expedition in 1858. Dr. Rink of the former considered that the islands belong to the Tertiary age. Von Hochstetter of the Austrian expedition classified the most important formations thus: eruptive, serpentine and gabbro; marine deposits, probably late Tertiary, consisting of sandstones, slates, clay, marls, and plastic clay; recent corals. He considered the whole group connected geologically with the great islands of the Malay Archipelago farther south. Earthquakes of great violence were recorded in 1847 and 1881 (with tidal wave), and mild shocks were experienced in December 1899.

The climate is unhealthy for Europeans. The islands are exposed to both monsoons, and smooth weather is only experienced from February to April, and in October. Rain falls throughout the year, generally in sharp, heavy showers. The rainfall varies from 90 to 135 in., and the shade temperature from 64° to 92° F.

Flora and Fauna.—The vegetation of the Nicobars has not been subjected to a systematic examination by the Indian Forest Department like that of the Andamans, and indeed the forests are quite inferior in economic value to those of the more northerly group; besides fruit trees—such as the coco-nut (*Cocos nucifera*), the betel-nut (*Areca catechu*), and the mellori (*Pandanus leeram*)—a thatching palm (*Nipa fruticans*) and various timber trees have some commercial value, but only one timber tree (*Myristica irya*) would be considered first-class in the Andamans. The palms of the Nicobars are, however, exceedingly graceful. The mammals are not numerous. In the southernmost islands are a small monkey, rats and mice, tree-shrews (*Cladobates nic.*), bats, and flying-foxes, but it is doubtful if the "wild" pig is indigenous; cattle, when introduced and left, have speedily become "wild." There are many kinds of birds, notably the megapod (*Megapodius nic.*), the edible-nest-building swift (*Collocalia nidifica*), the hackled and pied pigeons (*Calaenas nic.* and *Carpophaga bicolor*), a paroquet (*Palaeornis caniceps*) and an oriole (*Oriolus macrourus*). Fowls, snipe and teal thrive after importation or migration. Reptiles—snakes, lizards and chameleons, crocodiles, turtles and an enormous variant of the edible Indian crab—are numerous; butterflies and insects, the latter very troublesome, have not yet been systematically collected. The fresh-water fish are reported to be of the types found in Sumatra.

Natives.—The Nicobarese may be best described as a Far Eastern race, having generally the characteristics of the less civilized tribes of the Malay Peninsula and the south-eastern portion of the Asiatic continent, and speaking varieties of the

Mon-Annam group of languages, though the several dialects that prevail are mutually unintelligible. Though short according to the standard of whites (average height, man, 5 ft. 3½ in.; woman, 5 ft.), the Nicobarese are a fine, well-developed race, and live to seventy or eighty years of age. Their mental capacity is considerable, though there is a great difference between the sluggish inhabitant of Great Nicobar and the keen trader of Car Nicobar. The religion is an undisguised animism, and all their frequent and elaborate ceremonies and festivals are aimed at exorcising and scaring spirits. On the whole the Nicobarese are a quiet, inoffensive people, friendly to each other, and not quarrelsome, and by inclination friendly and not dangerous to foreigners. Such government as there is, is by the village. The clothing, when not a caricature of European dress, is of the scantiest, and the waggling tags in which the loin-cloths are tied behind gave rise to fanciful stories that the inhabitants were naked and tailed. The houses are good, and often of considerable size. The natives are skilful with their lands, and though they never cultivate cereals, exercise some care and knowledge over the coco-nut and tobacco, and have had much success with the foreign fruits and vegetables introduced by the missionaries. The staple article of trade has always been the ubiquitous coco-nut, of which it is computed that 15 million are produced annually. There is an old-established internal trade, chiefly between the older islands and Chowra, for pots (which are only made there) and racing and other canoes.

History.—The situation of the Nicobars along the line of a very ancient trade route has caused them to be reported by traders and seafarers through all historical times. In the 17th century the islands began to attract the attention of missionaries. At various times France, Denmark, Austria and Great Britain all had more or less shadowy rights to the islands, the Danes being the most persistent in their efforts to occupy the group, until in 1869 they relinquished their claims in favour of the British, who at once began to put down the piracies of the islanders, and established a penal settlement, which was withdrawn in 1888. There are native agencies at Nankauri and on Car Nicobar, both of which places are gazetted ports. At the latter is a Church of England mission station under an Indian catechist.

Ethnology.—The Nicobarese inhabitants are probably of mixed Malay and Indonesian origin, with hair generally straight, sometimes wavy. The Shom Pen tribe of Great Nicobar differs from or perhaps is merely purer blooded than the coastal tribes. The use of cloth waist-belts with the end pulled between the legs under the belt, behind which it hangs down at the back has given rise to stories of tailed men. There are six tribes said, like the sexes, to be distinguishable by their smell, the natives of Chowra being malodorous on account of eating dog flesh. The marriage tie is loose, the *couvade* (*otô*) is practised, the head is flattened in infancy, the teeth blackened and the ears distended. Betel is chewed, pandanus fruit used as food, and the people dislike milk. Pigs and fowls are fed on coco-nut. Houses are built on piles; a benign Creator is believed in; disease is ascribed to sorcerers and treated by expulsion of devils or by pretended extraction of foreign matter palmed by the sorcerer. Villages are protected by scare-devils. The cross-bow is used.

See E. H. Man, *The Nicobar Islanders* (Journal of the Royal Anthropol. Inst., 1889); Kloss, *In the Andaman and Nicobar* (1903); Whitehead, *In the Nicobar Islands* (1924).

NICOLAI, CHRISTOPH FRIEDRICH (1733-1811), German author and bookseller, was born on March 18, 1733 at Berlin, son of the well-known bookseller, Christoph Gottlieb Nicolai (d. 1752). Nicolai's *Briefe über den jetzigen Zustand der schönen Wissenschaften in Deutschland*, published anonymously in 1755 and reprinted by G. Ellinger in 1894, were directed against both Gottsched and Gottsched's Swiss opponents, Johann Jakob Bodmer and Johann Jakob Breitinger; his enthusiasm for English literature won for him the friendship of Lessing and Moses Mendelssohn. In association with Mendelssohn he established in 1757 the *Bibliothek der schönen Wissenschaften*; and with Lessing and Mendelssohn *Briefe, die neueste Literatur betreffend* (1759); from 1765 to 1792 he edited the *Allgemeine deutsche Bibliothek*. The *Bibliothek* served as the organ of the so-called

"popular philosophers," who warred against authority in religion and against what they conceived to be extravagance in literature, and Nicolai showed a complete incomprehension of the new movement of ideas represented by Herder, Goethe, Schiller, Kant and Fichte. He died in Berlin on Jan. 11, 1811.

See his *Bildniss und Selbstbiographie* ed. M. S. Löwe in the *Bildnisse jetzt lebender Berliner Gelehrter*, in 1806. See also L. F. G. von Göckingk, *F. Nicolai's Leben und literarischer Nachlass* (1820); J. Minor, *Lessings Jugendfreunde*, in J. Kürschner's *Deutsche Nationalliteratur*, vol. lxxii. (1883); M. Sommerfeld, *F. Nicolai und der Sturm und Drang* (Halle, 1921).

NICOLAI, OTTO (1810–1849), German composer, was born on the 9th of June in Königsberg. He studied music in Berlin and in 1833 became organist to the German embassy in Rome. There his operas *Enrico II.* (1839) and *Il Templario* (1840) were produced, besides some church music, a series of songs, and a number of compositions for the pianoforte. He was Kapellmeister of the court opera in Vienna from 1841 to 1847, when he was appointed Hof Kapellmeister at the Berlin Opera House. There, only two days before he died (on the 11th of March, 1849), was performed his famous opera, *The Merry Wives of Windsor*.

NICOLAS, SIR NICHOLAS HARRIS, G.C.M.G., 1840 (1799–1848), English antiquary, fourth son of John Harris Nicolas (d. 1844), was born at Dartmouth on the 10th of March 1799. Having served in the navy from 1812 to 1816, he studied law and was called to the bar at the Inner Temple in 1825. His work as a barrister, however, was confined principally to peerage cases before the House of Lords, and his time was mainly devoted to genealogical and historical studies. He died near Boulogne on Aug. 3, 1848.

The most important of the works of Nicolas is his *History of the Orders of Knighthood of the British Empire; of the Order of the Guelphs; and of Medals, Clasps, etc., for Naval and Military Services* (1841–42).

See E. S. P. Haynes, *Personalia* (1918).

NICOLAUS DAMASCENUS, Greek historian and philosopher of Damascus, flourished in the time of Augustus and Herod the Great, with both of whom he was on terms of friendship. He instructed Herod in rhetoric and philosophy, and had attracted the notice of Augustus when he accompanied his patron on a visit to Rome. Later, when Herod's conduct aroused the suspicions of Augustus, Nicolaus was sent on a mission to bring about a reconciliation. He survived Herod, and it was through his influence that the succession was secured for Archelaus; but the date of his death, like that of his birth, is unknown. Fragments of his universal history (*Ἱστορία καθολική*), from the time of the Assyrian empire to his own days, his autobiography, and his life of Augustus (*Βίος Καίσαρος*) have been preserved, chiefly in the extracts of Constantine Porphyrogenitus.

Fragments in C. Müller, *Fragmenta historicorum Graecorum*, iii.; see also F. Navet, *Nikolaus von Damaskus* (1853), containing an account of his life and writings, and translation of the fragments.

NICOLAUS OF LYRA (c. 1265–1349), French commentator, was born in Lire, now Vieille-Lyre (Eure). He entered the Franciscan order at Verneuil about 1300, and studied at Paris, where, becoming a doctor some time before 1309, he taught for many years. From 1319 he was provincial of his order in France, and was present in that capacity at the general chapter at Pérouse (1321). In 1325 he was provincial of Burgundy, and as executor of the estate of Jeanne of Burgundy, widow of King Philip VI., he founded the college of Burgundy at Paris, where he died in the autumn of 1349, being buried in the chapter hall of the convent of the Cordeliers.

Among the authentic works of Nicolaus of Lyra are: (1) two commentaries on the whole Bible, one (*Postilla litteralis*, 1322–31) following the literal sense, the other (*Postilla mystica seu moralis*, 1339) following the mystic sense. There are numerous editions (Rome, 1471–72; Douai, 1617; Antwerp, 1634). (2) *Tractatus de differentia nostrae translationis* (i.e., Vulgate) *ab Hebraica veritate*, 1333. (3) Two treatises against the Jews. (4) A theological treatise on the Beatific Vision, directed against pope John XXII. (1334), unpublished. (5) *Contemplatis de vita S. Francisci*, a book of devotions.

In addition to the notices in Wadding, du Moustier, Sbaraglia and Fabricius, see C. Siegfried, in *Archiv. f. wissenschaftliche Erforschung des A.T.*, vols. i., ii.; A. Merx, *Die Prophetie des Joel und ihre Ausleger* (1879, pp. 305–366); M. Fischer in *Jahrbücher f. protestantische The-*

ologie, xv.; F. Maschkowski, in *Zeitschrift f. alttestamentliche Wissenschaft*, xv.; Neumann in *Revue des études juives*, vols. 26 and 27; H. Labrousse in *Positions des thèses de l'École des Chartes* (1906).

NICOLE, PIERRE (1625–1695), one of the most distinguished of the French Jansenists, was the son of a provincial barrister, and was born at Chartres. Sent to Paris in 1642 to study theology, he soon entered into relations with the Jansenist community at Port Royal (q.v.) through his aunt, Marie des Anges Suireau, who was for a short time abbess of the convent. For some years he was a master in the "little school" for boys established at Port Royal, and taught Greek to young Jean Racine, the future poet. With Antoine Arnauld, he acted as general editor of the controversial literature put forth by the Jansenists. He had a large share in collecting the materials for Pascal's *Provincial Letters* (1656); in 1658 he translated the *Letters* into Latin, under the pseudonym of Nicholas Wendrock. In 1664 he himself began a series of letters, *Les Imaginaires*, intended to show that the heretical opinions commonly ascribed to the Jansenists really existed only in the imagination of the Jesuits. His letters being violently attacked by Desmaretz de Saint-Sorlin, an erratic minor poet who professed great devotion to the Jesuits, Nicole replied to him in another series of letters, *Les Visionnaires* (1666). In the course of these he observed that poets and dramatists were no better than "public poisoners."

About the same time Nicole became involved in a controversy about transubstantiation with the Huguenot Claude; out of this grew a massive work *La Perpétuité de la foi de l'église catholique touchant l'eucharistie* (1669), the joint effort of Nicole and Antoine Arnauld. But Nicole's most popular production was his *Essais de morale* (14 vols., 1671 seq.), a series of short discussions on practical Christianity. In 1679, on the renewal of the persecution of the Jansenists, Nicole was forced to fly to Belgium in company with Arnauld. But the two soon parted. Nicole was elderly and in poor health; the life of a fugitive was not to his taste, and he complained that he wanted rest. "Rest," answered Arnauld, "when you have eternity to rest in!" In 1683 Nicole made a rather ambiguous peace with the authorities, and was allowed to come back to Paris. There he continued his literary labours; he was writing a refutation of the new heresy of the Quietists when death overtook him on Nov. 16, 1695. (See PORT ROYAL.)

Several abridgments of the *Essais* exist, notably a *Choix des essais de morale de Nicole*, ed. Silvestre de Sacy (1857).

Nicole's life is told at length in the 4th volume of Sainte Beuve's *Port-Royal*.

NICOLL, ROBERT (1814–1837), Scottish poet, was born on Jan. 7, 1814, at the farm of Little Tullybeltane, in the parish of Auchtergaven, Perthshire. At sixteen the boy was apprenticed to a grocer and wine-merchant at Perth. In 1833 he began to contribute to *Johnstone's Magazine* (afterwards *Tait's Magazine*), and in the next year his apprenticeship was cancelled. In 1836 he became editor of the *Leeds Times*. He died at the house of his friend William Tait, at Trinity, near Edinburgh, on Dec. 7, 1837, in his twenty-fourth year. He had published a volume of *Poems* in 1835; and in 1844 appeared a further volume, *Poems and Lyrics*, with an anonymous memoir of the author by Mrs. C. I. Johnstone. The best of his lyrics are those written in the Scottish dialect.

See P. R. Drummond, *Life of Robert Nicoll, Poet* (1884).

NICOLL, SIR WILLIAM ROBERTSON (1851–1923), Scottish Nonconformist divine and man of letters, was born at Auchindoir, Aberdeenshire, on Oct. 10, 1851, the son of a Free Church minister. He graduated M.A. at Aberdeen in 1870, and studied for the ministry at the Free Church college there until 1874, when he was ordained minister of the Free church at Dufftown. Three years later he moved to Kelsø, and in 1884 became editor of the *Expositor*. In 1886 he founded the *British Weekly*, a Nonconformist organ which obtained great influence over opinion in the free churches. Robertson Nicoll helped to make the fortunes of the paper by the papers which he contributed over the signature of "Claudius Clear." He also founded and edited the *Bookman* (1891, etc.), and acted as chief literary adviser to the publishing firm of Hodder and Stoughton. He edited *The*

Expositor's Greek Testament (1897, etc.), and a series of *Contemporary Writers* (1894, etc.), and *Literary Lives* (1904, etc.). He was knighted in 1909, and died on May 4, 1923.

NICOLLS, RICHARD (1624–1672), American colonial governor, was born probably at Amptill, Beds., England, in 1624. He commanded a royalist troop of horse during the Civil War, and on the defeat of the king went into exile. Soon after the Restoration he entered the service of the duke of York, through whose influence he was appointed in 1664 on a commission to conquer New Netherland from the Dutch and to regulate the affairs of the New England colonies and settle disputes among them. The expedition set sail from Portsmouth on May 25, 1664, and New Amsterdam was surrendered to Nicolls on Sept. 8. Under authority of a commission from the duke of York, Nicolls assumed the position of deputy governor of New Netherland (New York). His policy was vigorous but tactful, and the transition to the new regime was made smoothly and with due regard to the interests of the conquered people. The English system of law and administration was at once introduced into Long Island, Staten Island and Westchester, where the English element already predominated, but the change was made much more slowly in the Dutch sections. A code of laws, known as the "duke's laws," drafted by the governor with the help of his secretary, Matthias Nicolls (c. 1630–1687), was proclaimed in 1665 and continued in force until 1683. Nicolls returned to England in the summer of 1668 and continued in the service of the duke of York. He was killed in the naval battle of Southwold bay May 28, 1672.

See J. R. Brodhead, *History of the State of New York* (rev. ed., 1872); and Woodrow Wilson, *A History of the American People*, vol. 1. (1902). For the "Duke's Laws" see *Laws of Colonial New York*, 1. 6–100.

NICOMACHUS, a Neo-Pythagorean philosopher and mathematician, born at Gerasa in Arabia Petraea, flourished about 100 A.D. Two treatises by him are extant: (1) *The Introductio arithmetica* sets out the elementary theory and properties of numbers. Numbers are no longer denoted by lines as in Euclid, but are written in the ordinary notation; hence general principles can only be stated with reference to particular numbers taken as illustrations. Nicomachus states a rule about cubes which enables us to sum any number of forms of the series of natural cubes beginning from 1; otherwise the book is mathematically unimportant. It had, however, great vogue ("you count like Nicomachus" says a character in Lucian). A Latin translation by Apuleius of Madaura (born about 125 A.D.) is lost; but we have Boëtius's version. The commentators include Iamblichus, Heronas, Asclepius of Tralles, Joannes Philoponus, Proclus. The Greek text has been edited by R. Hoche (Teubner, 1866) and the commentaries of Iamblichus and Philoponus by Pistelli (Teubner, 1894) and Hoche (Leipzig, 1864, and Berlin, 1867) respectively. There is an elaborate English edition by F. E. Robbins and L. C. Karpinski (New York, 1926). (2) *The Enchiridion Harmonices* (edited by Jan in *Musici Scriptores Graeci*, 1895) is on the Pythagorean theory of music. Nicomachus is also said to have written *Theologumena arithmeticae* (in two books) on the properties of numbers, of which the *Theologumena arithmeticae* edited by Ast (1817) contains no more than fragments, at most.

(T. L. H.)

NICOMACHUS, of Thebes, Greek painter, active c. 390–340 B.C., was a contemporary of the greatest painters of Greece; Vitruvius observes that if his fame was less than theirs, it was the fault of fortune rather than of demerit. Pliny (xxxv. 108) gives a list of his works; among them a "Rape of Persephone," "Victory in a Quadriga," a group of Apollo and Artemis, and the "Mother of the Gods seated on a Lion." Pliny tells us that he was a very rapid worker and used but four colours.

NICOMEDIA (mod. *İsmid*), an ancient town at the head of the Gulf of Astacus, which opens on the Propontis, was built in 264 B.C. by Nicomedes I. of Bithynia, and has ever since been one of the chief towns in this part of Asia Minor. It was the metropolis of Bithynia under the Roman empire (see **NICAEA**), and Diocletian made it the chief city of the East. Owing to its position at the convergence of the Asiatic roads to the new

capital, Nicomedia retained its importance even after the foundation of Constantinople and its own capture by the Turks (1338).

NICOPOLIS ("Victory-City"), **ACTIA**, an ancient city of Epirus, founded 31 B.C. by Octavian (Augustus) in memory of his victory over Antony and Cleopatra at Actium. The colony, composed of settlers from many neighbouring towns, succeeded and became the capital of southern Epirus and Acarnania, with the right of sending five representatives to the Amphictyonic council. On the spot where Octavian's tent had stood he built a sanctuary to Neptune adorned with beaks of captured galleys, and instituted the Actian games in honour of Apollo. The city was restored by the emperor Julian, and again (after the Gothic invasion) by Justinian; but in the middle ages it was supplanted by Prevesa. The ruins, now known as Palaeoprevesa (Old Prevesa), lie about 3 m. north, on a small bay at the narrowest part of the peninsula which separates the Gulf of Arta (Sinus Ambracius) from the Ionian Sea. The most conspicuous objects are the acropolis, two theatres and an aqueduct.

NICOSIA, the capital of Cyprus, situated in the north central part of the island. Pop. (1911) 18,461. Its earliest name was Ledra, but Leucos, son of Ptolemy Soter (280 B.C.), is said to have changed its name to Leucotheon, corrupted into mediaeval Greek *Leucosia* and Frankish *Nicosia*. A mile south-west of the town lies the very large Bronze age necropolis known as Hagia Paraskevi. The principal monuments of the Lusignan period are the fine Gothic cathedral of St. Sophia, the church of St. Catherine, of the 14th century (both these are now mosques); and the church of St. Nicolas of the English (now a grain store), built for the Knights of St. Thomas of Acre; and the gateway of the Venetian palace of the 15th century. The circuit of the city was reduced in 1567, under the direction of the Venetian engineer, G. Savorgnano, from 9 m. to 3 m.; 80 churches and a number of fine houses were sacrificed. The new walls were given a circular shape, with 11 bastions and three gates. In 1571 Nicosia was besieged and taken by the Turks, but remains the principal centre of business and administration. Water is supplied by two aqueducts. The residence of the governor, the Government offices, museum, hospital, prison and English church are without the walls. The fosse has been planted, and part of it used as an experimental garden. The chief industries are tanning and hand weaving.

NICOSIA, city and episcopal see (since 1816), Sicily, province of Catania, 21 m. by road north of the railway station of Leonforte (which is 49 m. west of Catania), 2,840 ft. above sea-level. Pop. (1921) 14,586. The town retains a thoroughly mediaeval appearance, with a fine Norman cathedral and some other interesting churches, among them S. Maria Maggiore, with a reredos by Antonio Gagini. A Lombard dialect is still spoken here.

NICOTERA, GIOVANNI (1828–1894), Italian patriot and politician, was born at San Biagio on Sept. 9, 1828. Joining the party of Young Italy he was among the combatants at Naples in May 1848, and was at San Pancrazio with Garibaldi during the defence of Rome. After the fall of Rome he fled to Piedmont, where he organized the expedition to Sapri in 1857, but shortly after his arrival there he was defeated and severely wounded by the Bourbon troops. Condemned to death, but reprieved through the intervention of the British minister, he remained a prisoner at Naples and at Favignana until 1860, when he joined Garibaldi at Palermo. Sent by Garibaldi to Tuscany, he attempted to invade the Papal States with a volunteer brigade, but his followers were disarmed and disbanded by Ricasoli and Cavour. In 1862 he was with Garibaldi at Aspromonte; in 1866 he commanded a volunteer brigade against Austria; in 1867 he invaded the Papal States from the south, but the defeat of Garibaldi at Mentana put an end to his enterprise. His parliamentary career dates from 1860. During the first ten years he engaged in violent opposition, but from 1870 onwards he joined in supporting the military reforms of Ricotti. Upon the advent of the Left in 1876, Nicotera became minister of the interior, and governed with remarkable firmness. He was obliged to resign in December 1877, when he joined Crispi, Cairoli, Zanardelli and Baccarini in forming the "pentarchy" in opposition to Depretis, but he only returned to power thirteen years later as minister of the interior in the Rudini cabinet of

1891. On this occasion he restored the system of uninominal constituencies and resisted the socialist agitation. He fell with the Rudini cabinet in May 1892, and died at Vico Equense, near Naples, on June 13, 1894.

See V. Giordano, *La Vita ed i discorsi di Giovanni Nicotera* (Salerno, 1878); Mauro, *Biografia di Giovanni Nicotera* (Rome, 1886; German trans., Leipzig, 1886); and Mario, *In memoria di Giovanni Nicotera* (Florence, 1894).

NICOTIANA, a genus of plants of the nightshade family (Solanaceae), comprising about 45 species of herbs and shrubs, native chiefly to tropical America. They are strongly-scented, annuals or perennials, possessing narcotic-poisonous properties. They have alternate, simple, usually entire but sometimes wavy-margined, large leaves, and white, yellow, greenish or purple, fragrant flowers, with a long, tubular, five-lobed corolla, usually opening at night. Besides *N. Tabacum*, important as the source of commercial tobacco (*q.v.*), several other species are cultivated as ornamental plants. Some 10 species are found in the southern and western parts of the United States, *N. glauca* (tree tobacco) a slender evergreen shrub native to Brazil, has become widely naturalized on the Pacific coast. *N. rustica* (wild tobacco), still cultivated by the Indians of the eastern States, is of uncertain origin.

NICOTINE, a volatile liquid, is the principal alkaloid (see ALKALOIDS) of tobacco, in which it occurs to the extent of 4 to 5% along with minute amounts of closely related alkaloids. Nicotine is still used in medicine to a small extent, but the principal demand for it is as a horticultural insecticide. It is prepared by adding lime or caustic soda to a filtered, concentrated, aqueous extract of tobacco (stalk and other tobacco refuse is generally used) and recovering the alkaloid so set free, by extraction with a suitable solvent or by steam-distillation. This crude alkaloid is freed from water by a chemical drying agent, such as solid potash, and then fractionally distilled. Pure nicotine, $C_{10}H_{14}N_2$, is a highly poisonous colourless liquid, with an unpleasant odour; it boils at $246-274^\circ\text{C}$. [α], -168.5° , and is soluble in most solvents including water. The picrate crystallizes in short, yellow prisms, melts at 218°C and is characteristic of the alkaloid. Nicotine was synthesized in the year 1904 by Pictet, Crepieux and Rotschy.

NICHEROY, a city of Brazil and capital of the State of Rio de Janeiro, on the E. shore of the Bay of Rio de Janeiro, opposite the city of that name. Pop. (including its municipal district), 1920, 86,238. A railway connects the city with the interior, with Macaê, on the coast, and with the lines of Minas Geraes. Nicheroy is practically a residential suburb of Rio de Janeiro. It occupies, in great part, the low alluvial plain that skirts the shores of the bay and fills the valleys between numerous low wooded hills. The site is shut off from the sea-coast by a range of high rugged mountains. The shore line of the bay is broken by large, deeply indented bays (that of Jurujuba being nearly surrounded by wooded hills), shallow curves and sharp promontories.

The city consists of a number of these partially separated districts—Praia Grande, São Domingos, Icarahy, Jurujuba, Santa Rosa, São Lourenço, Ponta d'Areia and Barreto—all together covering 8 or 9 m. of the shore. An electric street railway connects all the outlying districts with the ferry stations of Praia Grande and São Domingos. The city is characteristically Portuguese in the construction and style of its buildings—low, heavy walls of broken stone and mortar, plastered and coloured outside, with an occasional facing of glazed Lisbon tiles, and covered with red tiles. Among the public buildings are several churches and hospitals (including the Jurujuba yellow-fever hospital and the Barreto isolation hospital), the Government palace, a municipal theatre and a large Salesian college situated in the suburbs of Santa Rosa on an eminence overlooking the lower bay. Several large islands fill the upper bay near the eastern shore; some are used as coal deposits for the great steamship companies, and one (Flores) is used as an immigrants' dépôt. Manufactures include cotton and woollen fabrics, tobacco, spirits, soap and tiles.

The first settlement on the east side of the Bay of Rio de Janeiro dates from 1671, when a chapel was erected at Praia

Grande, in the vicinity of an Indian village. The settlement did not become a village until 1819, when it was named Villa Real da Praia Grande. In 1834 the city and municipal district of Rio de Janeiro were separated from the province, and Praia Grande became the capital of the latter in the following year. In 1836 it was raised to the dignity of a city and received the appropriate name of Nicheroy, from the Indian name *Nyterôï*, "hidden water." In the naval revolt of 1893-94 the older districts of the city suffered much damage from desultory bombardments, but the insurgents were too few to take possession. Soon afterwards the seat of government was removed to Petropolis, where it remained until 1903, when Nicheroy again became the capital of the State.

NIEBUHR, BARTHOLOMÄUS (1776-1831), German statesman and historian, son of Karsten Niebuhr (*q.v.*), was born at Copenhagen on Aug. 27, 1776. After studying at the university of Kiel, he became private secretary to Count Schimmelmann, Danish minister of finance, but in 1799 entered the state service. He was chief director of the National Bank from 1804 to 1806 when he took a similar appointment in Prussia. He accompanied the Prussian government to Königsberg, where he rendered considerable service in the commissariat, and was afterwards still more useful as commissioner of the national debt and by his opposition to ill-considered schemes of taxation. In 1810 he was made royal historiographer and professor at Berlin university, and two years later published two volumes of his *Römische Geschichte* (Eng. trans., 1847-51). In 1816, while on his way to Rome to take up the post of ambassador, he discovered in the cathedral of Verona the long-lost *Institutes* of Gaius, afterwards edited by Savigny, to whom he communicated the discovery under the impression that he had found a portion of Ulpian. During his residence in Rome Niebuhr discovered and published fragments of Cicero and Livy, aided Cardinal Mai in his edition of Cicero *De Republica*, and shared in planning the great work on the topography of ancient Rome by von Bunsen and Platner (1773-1855), to which he contributed several chapters. In 1823 he resigned the embassy and established himself at Bonn, where he died on Jan. 2, 1831.

Niebuhr's *Roman History*, to which he added a 3rd vol. (1832), counts among epoch-making histories both as marking an era in the study of its special subject and for its momentous influence on the general conception of history. "The main results," says Leonhard Schmitz, "arrived at by the inquiries of Niebuhr, such as his views of the ancient population of Rome, the origin of the plebs, the relation between the patricians and plebeians, the real nature of the *ager publicus*, and many other points of interest, have been acknowledged by all his successors." He was the first to deal with the ancient history of Rome in a scientific spirit and introduced new principles into historical research. He suggested the theory of the myth; he brought in inference to supply the place of discredited tradition and showed the possibility of writing history in the absence of original records; he drew attention to the importance of ethnological distinctions, and laid stress on institutions, and social traits to the neglect of individuals.

See Niebuhr's *Politische Schriften* edited by G. Kuntzel in 1923 and his *Briefe* by D. Gerhard (1926 foll.); D. Hensler, *Lebensnachrichten über B. G. Niebuhr, aus Briefen desselben und aus Erinnerungen einiger seiner nächsten Freunde* (3 vols., 1838-39, Eng. trs. 1852); J. Classen, *B. G. Niebuhr, eine Gedächtnisschrift* (1876); G. Eysenhardt, *B. G. Niebuhr* (1886); J. E. Sandys, *History of Classical Scholarship* (1908), iii.; C. Seitz, *L'historien Niebuhr* (1909).

NIEBUHR, KARSTEN (1733-1815), German traveller, was born at Lüdingworth, Lauenburg, Holstein, on March 17, 1733, the son of a farmer. He worked as a peasant in his early years, but managed to learn surveying. In 1760 he was invited to join the expedition which was being sent out by Frederick V. of Denmark for the scientific exploration of Egypt, Arabia and Syria. He studied mathematics and Arabic for a year and a half before the expedition set out. The expedition sailed in January 1761, and, landing at Alexandria, ascended the Nile. Proceeding to Suez, Niebuhr visited Mount Sinai, and in October 1762 the expedition sailed from Suez to Jeddah, journeying thence overland to Mocha. Here in May 1763 the philologist of the expedition, van Haven, and the naturalist Forskål, died. Sana, the capital

of Yemen, was visited, but the remaining members of the expedition were obliged to return to Mocha. Niebuhr saved his life and restored his health by adopting native dress and food. From Mocha the ship sailed to Bombay; the artist of the expedition and the surgeon died. Niebuhr was now the only surviving member of the expedition. He stayed fourteen months at Bombay, and then returned home by Muscat, Bushire, Shiraz and Persepolis, visited the ruins of Babylon, and thence went to Baghdad, Mosul and Aleppo. After a visit to Cyprus he toured Palestine, crossing Mount Taurus to Brussa, reaching Constantinople in February 1767 and Copenhagen in the following November. He married in 1773, and held a post in the Danish military service and lived at Copenhagen. In 1778 he accepted a position in the civil service of Holstein, and went to reside at Meldorf, where he died on April 26, 1815.

He published *Beschreibung von Arabien* (1772); *Reisebeschreibung von Arabien und anderen umliegenden Ländern* (2 vols., 1774-78) besides papers in *Deutsches Museum*. He also edited Forskål's *Descriptiones animalium*, *Flora Aegyptiaco-Arabica*, and *Icones rerum naturalium* (1775-76).

French and Dutch translations of his narratives were published during his lifetime, and a condensed English translation, by Robert Heron, of the first three volumes in Edinburgh (1792). His son Barthold (see above) published a short *Life* at Kiel in 1817; an English version was issued in 1838 in the *Lives of Eminent Men*, published by the Society for the Diffusion of Useful Knowledge. See D. G. Hogarth, *The Penetration of Arabia* ("Story of Exploration" series) (1904).

NIEDERWALD, a broad hill in Germany, in the province of Hesse-Nassau, opposite Bingen, forming the south-western apex of the Taunus range (*q.v.*). Its summit is clothed with dense forests of oak and beech, while its southern and western sides, which descend sharply to the Rhine, are covered with vineyards. On the hill above Rüdesheim, stands the national monument of the war of 1870-71. Cog railways run up the hill.

NIEHAUS, CHARLES HENRY (1855-), American sculptor, was born at Cincinnati, O., on Jan. 24, 1855. He was a pupil of the McMichen school of design, Cincinnati, and also studied at the Royal Academy, Munich, returning to America in 1881. In 1885, after several years in Rome, he established his studio in New York city. In 1906 he became a National Academician. His principal works are a statue of President Garfield, for Cincinnati; the Hahnemann memorial, in Washington; "Moses" and "Gibbons," for the congressional library, and "James A. Garfield," "John J. Ingalls," "William Allen" and "Oliver P. Morton," for Statuary hall, the Capitol, Washington; "Hooker" and "Davenport," State House, Hartford, Conn.; the Astor memorial doors, Trinity church, New York; "General Forrest," Memphis, Tenn.; Generals Sherman and Lee, and William the Silent; "The Scrapper, or Greek Athlete using a Strigil"; statues of Lincoln, Farragut and McKinley, at Muskegon, Mich.; a statue of McKinley and a lunette for McKinley's tomb, at Canton, O.; "The Driller," at Titusville, Pa., in memory of Col. E. L. Drake, who, in 1859, originated the petroleum industry of America; "Francis Scott Key," at Baltimore; and the war memorials at Newark and Hackensack, N.J.

NIEL, ADOLPHE (1802-1869), marshal of France, was born at Muret on Oct. 4, 1802, and entered the École Polytechnique in 1821, whence he passed to the engineer school at Metz, becoming lieutenant in the Engineers in 1827 and captain in 1833. He served with distinction in Algeria and in the Crimean War. Niel commanded the IV. corps in the war against the Austrians. (See ITALIAN WARS.) On the field of battle of Solferino he was made a marshal of France. After service in a home command, he became minister of war (1867). He drafted and began to carry out a far-reaching scheme of army reform, based on universal service and the automatic creation of large reserves. He also rearmed the whole of the army with the chassepôt rifle. He died on Aug. 13, 1869, in Paris.

NIELLO (the Italian form of Lat. *nigellum*, diminutive of *niger*, "black"), a method of producing delicate and minute decoration on a polished metal surface by incised lines filled in with a black metallic amalgam. In some cases it is very difficult to distinguish niello from black enamel; but the black substance differs from true enamel in being metallic, not vitreous. Our

knowledge of the process and materials employed in niello-work is derived mainly from four writers, Eraclius the Roman (a writer probably of the 11th century), Theophilus the monk, who wrote in the 12th or 13th century, and, in the 16th century, Benvenuto Cellini and Giorgio Vasari. The design was cut with a sharp graving tool on the smooth surface of the metal, which was usually silver, but occasionally gold or even bronze. An alloy was formed of two parts silver, one-third copper and one-sixth lead; to this mixture, while fluid in the crucible, powdered sulphur in excess was added; and the brittle amalgam, when cold, was

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART
VENETIAN SWORD HILT OF THE
EARLY 16TH CENTURY

finely pounded, and sealed up in large quills for future use. A solution of borax to act as a flux was brushed over the metal plate and thoroughly worked into its incised lines. The powdered amalgam was then shaken out of the quills on to the plate, so as to cover completely all the engraved pattern. The plate was now carefully heated over a charcoal fire, fresh amalgam being added, as the powder fused, upon any defective places. When the powder had become thoroughly liquid, so as to fill all the lines, the plate was allowed to cool, and the whole surface was scraped, so as to remove the superfluous niello, leaving only what had sunk into and filled up the engraved pattern. Last of all the nielloed plate was very highly polished, till it presented the appearance of a smooth metal surface enriched with a delicate design in fine grey-black lines. This process was chiefly used for silver work on account of the vivid contrast between the whiteness of the silver and the darkness of the niello. As the slightest scratch upon the metal received the niello, and became a distinct black line, ornament of the most minute and refined description could easily be produced.

The earliest specimens of niello belong to the Roman period. Two fine examples are in the British Museum. One is a bronze statuette of a Roman general, nearly 2 ft. high, found at Barking hall in Suffolk. The dress and armour have patterns partly inlaid in silver and partly in niello. The dark tint of the bronze rather prevents the niello from showing out distinctly. This statuette is apparently a work of the 1st century. The other example is not earlier than the 4th century. It is a silver casket or lady's toilet box, in which were found an ampulla and other small objects, enriched with niello-work.

From Roman times till the end of the 16th century the art of working in niello seems to have been constantly practised in some part at least of Europe, while in Russia and India it has survived to the present day. From the 6th to the 12th century a large number of massive and splendid works in the precious metals were produced at Byzantium or under Byzantine influence, many of which were largely decorated with niello; the silver dome of the baldacchino over the high altar of S. Sophia was probably one of the most important of these. Niello is frequently mentioned in the inventories of the treasures belonging to the great basilicas of Rome and Byzantium. The Scala d'Oro in S. Mark's, Venice, 10th century, owes much of its refined beauty to niello patterns in the borders. This art was also practised by Bernward, artist-bishop of Hildesheim (11th century). In France, too, judging both from existing specimens of ecclesiastical plate and many records preserved in church inventories, this mode of decoration must have been frequently applied all through the middle ages; especially fine examples once existed at Notre Dame, Paris, and at Cluny, where the columns of the sanctuary were covered with plates of silver in the 11th century, each plate being richly ornamented with designs in niello. Among the early Teutonic and Celtic races, especially from the 8th to the 11th centuries, both in Britain and other countries, niello was frequently used to decorate the very beautiful personal ornaments of which so many specimens enrich the museums of Europe. The British Museum

possesses a fine fibula of silver decorated with a simple pattern in niello and thin plates of repoussé gold. This, though very similar in design to many fibulae from Scandinavia and Britain, was found in a tomb at Kerch (Panticapaeum). Several interesting gold rings of Saxon workmanship have been found at different times, on which the owner's name and ornamental patterns are formed in gold with a background of niello. One with the name of Ethelwulf, king of Wessex (836–858), is now in the British Museum. Another in the Victoria and Albert Museum has the name of Alhstan, who was bishop of Sherborne from 823 to 867. The metal-workers of Ireland, whose skill was quite unrivalled, practised largely the art of niello from the 10th to the 12th century, and possibly even earlier. Fine croziers, shrines, fibulae and other objects of Irish workmanship, most skilfully enriched with elaborate niello-work, exist in considerable numbers. From the 13th to the 16th century but little niello-work appears to have been produced in England. It is, however, in Italy that the art of niello-work was brought to greatest perfection. During the whole mediaeval period it was much used to decorate church plate, silver altar-frontals and the like. The magnificent frontals of Pistoia cathedral and the Florence baptistry are notable instances of this. During the 15th century, especially at Florence, the art of niello-work was practised by almost all the great artist-goldsmiths of that period. The British Museum possesses the finest existing example of 15th-century German niello. It is a silver beaker, covered with graceful scroll-work, forming medallions, in which are figures of cupids employed in various occupations.

BIBLIOGRAPHY.—*The Archaeological Journal* of 1862 (vol. xix., p. 323) has an excellent monograph on the subject, see also vol. xii., p. 79 and vol. iv., p. 247; Labarte, *Arts of the Middle Ages* (1855); Texier, *Dictionnaire de l'orfèvrerie*, p. 1822 (Paris, 1857); Lessing, *Collectaneen zur Literatur* (vol. xii., art. "Niellum"); C. Davenport in *Journal of Soc. of Arts*, vol. xlviii. (1901).

NIEM [NYEM, or NIEHEIM], **DIETRICH OF** (c. 1345–1418), mediaeval historian, was born at Nieheim, a small town subject to the see of Paderborn. He became a notary of the papal court of the rota at Avignon, and in 1376 went with the Curia to Rome. Urban VI. made him an abbreviator to the papal chancery. His chief importance lies in the part he took in the controversies arising out of the Great Schism. He accompanied Gregory XII. to Lucca in May 1408, and, having in vain tried to make the pope listen to counsels of moderation, he joined the Roman and Avignonese cardinals at Pisa. He adhered to the pope elected by the council of Pisa (Alexander V.) and to his successor John XXIII., resuming his place at the Curia. In view of the increasing confusion in the Church, however, he became one of the most ardent advocates of the appeal to a general council. He was present at the council of Constance as adviser to the German "nation." He died at Maastricht on March 22, 1418.

Niem's most important works are the *Nemus unionis*, a valuable collection of papal documents; and the *De schismate*, giving the history of events from 1376 to 1410, when he completed the work. It was continued in the *Historia de vita Johannis XXIII.*

For bibliography see Potthast, *Bibl. hist. mediæ ævi* (2nd ed., Berlin, 1896), p. 1,051, s.v. "Theodoricus de Niem"; and generally see the article on Niem by Theodor Lindner in *Allgemeine deutsche Biographie* (Leipzig, 1886); and Erler, *Diétrich von Nieheim* (Leipzig, 1887).

NIEMCEWICZ (nyëm-tsă'vich), **JULIAN URSIN** (1757–1841), Polish scholar, poet and statesman, was born in 1757. In the earlier part of his life he acted as adjutant to Kosciusko, was taken prisoner with him at the fatal battle of Maciejowice (1794), and shared his captivity at St. Petersburg. On his release he travelled for some time in America, where he married. After the Congress of Vienna he was secretary of state and president of the constitutional committee in Poland, but in 1830–31 he was again driven into exile. He died in Paris on the 21st of April 1841. Niemcewicz wrote comedies, novels and historical works, but he is best remembered by his *Historical Songs of the Poles* (Warsaw, 1816), a series of lyrical compositions.

His collected works were published in 12 vols. at Leipzig (1838–40).

NIEMEN or **MEMEL RIVER**: see NEMUNAS.

NIEPCE, **JOSEPH NICEPHORE** (1765–1833), French physicist, and one of the inventors of photography, was born at

Châlon-sur-Saône on March 7, 1765. He served in the army and was *administrateur* of the district of Nice from 1795 to 1801. Returning in that year to his birthplace, he devoted himself along with his elder brother Claude (1763–1828) to mechanical and chemical researches. In 1813 the idea of obtaining photographs first suggested itself to him, and in 1827 he succeeded in producing a photograph on a metal plate. Niepce learned that L. J. M. Daguerre was working in the same direction, and in 1829 the two united their forces "pour coopérer au perfectionnement de la découverte inventée par M. Niepce et perfectionnée par M. Daguerre" (see also PHOTOGRAPHY). Niepce died at Gras, his property near Châlon, on July 3, 1833.

NIERSTEIN, a village of Germany, in the republic of Hesse, on the left bank of the Rhine, 8 m. S. from Mainz by the railway to Worms. Pop. (1925) 4,591. Nierstein was originally a Roman settlement, and was a royal residence under the Carolingian rulers. Later it passed from the emperor to the elector palatine of the Rhine. It contains an old Roman bath—Sironabad—and sulphur springs. It is famous for its wines.

NIETZSCHE, FRIEDRICH WILHELM (1844–1900), German philosopher, born Oct. 15, 1844 at Röcken near Lützen, in the Prussian province of Saxony, came of a family of clergymen. Both his father and his grandfather were Protestant pastors, while his paternal grandmother and his mother, née Oehler, were also pastors' daughters. They were honourable, pious people, cheerful and happy, with a social life embellished by poetry and music; while their official standing secured them from the petty cares of existence. Nietzsche's forbears also enjoyed singular bodily vigour, which they retained in all its freshness to old age. Nietzsche's father, who died prematurely from a fall down a flight of steps, was an exception. In his joy over the birth of a son, this father inserted in the Church register of Röcken at Friedrich's christening the question from Luke i., 66, "what manner of child shall this be?"

Wagner and Schopenhauer.—The boy was educated at Naumburg and at the famous old Fürstenschule of Pforta, which he left with an excellent leaving certificate (with only one "unsatisfactory," in mathematics). In the autumn (1864) he was entered at the University of Bonn, as a student of theology and classical philology. As, however, he found at Bonn an exceptionally gifted teacher of classical philology in Ritschl, he soon, to the great grief of his family, abandoned theology and devoted himself exclusively to philological studies. In fact, the undergraduate Nietzsche severed himself not only from theology but from Christianity; the determining influence in this change was his reading of Schopenhauer, whose great work, *The World as Will and Idea*, had fallen into his hands by accident.

His enthusiasm for Schopenhauer and for music—an art which Nietzsche loved and practised throughout his life—brought him into touch with Richard Wagner, who was then living at Triebtschen on the Lake of Lucerne. Nietzsche, as a young student of 25, had, on Ritschl's recommendation, been appointed professor at Basel; and close personal intercourse with Wagner followed. The two men agreed in their judgment of their own time, and in their appreciation of antiquity; Nietzsche combined Wagner's views and his own researches on Greek artistic achievement in *Die Geburt der Tragödie* (1870–71). But the book was severely condemned by the official German school, under the leadership of Ulrich v. Wilamowitz, and Nietzsche as a classical scholar was outlawed.

He clung all the more closely to Wagner, at whose side he waged war against German lack of culture. The four *Unzeitgemässen Betrachtungen*, devoted to this struggle, were intended to restore Germany, whose development Nietzsche felt had been jeopardized by the victories of 1864, '66 and '70, to intellectual pursuits. These four polemical works (1873–76) are entitled *David Strauss, der Bekenner und Schriftsteller*; *Vom Nutzen und Nachteil der Historie für das Leben*; *Schopenhauer als Erzieher*; and *Richard Wagner in Bayreuth*.

In working on the last of these, Nietzsche began to be conscious of reservations both on the cultural value of Wagner's creations, and on his personality; during the Bayreuth Festival, these reser-

ventions led to estrangement and ultimately to passionate renunciation. (See *Der Fall Wagner, Nietzsche contra Wagner*, 1888.) Nietzsche held that Wagner's art was nothing more than the dope required by a decadent generation, and the whitewashing of Schopenhauer's pessimism. In both his models, Schopenhauer and Wagner, he began to discern tendencies towards Christian and Buddhist negation, and therefore, though with much pain, broke loose from them. The first expression of this emancipation is found in *Menschliches all-zu Menschliches* (2 vols. 1878), in which Nietzsche enters on his essentially negative critical period. In 1879, probably owing to the pain caused by his violent separation from his friends and masters, Nietzsche's health became so bad that he had to resign his professorship at Basle. Thenceforward, he lived chiefly in northern Italy, the Engadine, or the French Riviera, on the small pension granted him by the university of Basle.

Maturity.—From this time onwards, he devoted himself wholly to philosophy, and with the gradual improvement in his health, entered the third and mature period of his creative life, during which his best works were given to the world. In *Morgenröte* (1880-81) and *Die fröhliche Wissenschaft* (1881-82), he fought romanticism in all its manifestations, and revealed art, religion and philosophy as illusions invented by man as weapons in his struggle for development, for prevailing over himself and his fellows.

In the years 1883-85, he produced work which he himself regarded as his highest achievement. Written in the style of an Old Testament prophet, this work which was his own New Testament, the gospel of the superman and the eternal recurrence, was entitled *Also Sprach Zarathustra. Ein Buch für Alle und Keinen*. Nietzsche provided a valuable interpretation of this work, parts of which even to-day are difficult to understand, in the two volumes of *Jenseits von Gut und Böse* (1885-86) and *Genealogie der Moral* (1887). He then planned a greater work, *Der Wille zur Macht: Versuch zur Umwertung aller Werte*. It was never finished, but contains no less than 1,052 valuable aphorisms: its two volumes (Vols. xiv. and xv. in the English works) are divided into the following sections:—(1) European Nihilism, (2) A Criticism of the Highest Values that have prevailed hitherto, (3) The Principles of a New Valuation, (4) Discipline and Breeding. The three fine and stimulating books, *Götzendämmerung, oder wie man mit dem Hammer philosophiert*, *Der Antichrist*, and the autobiography *Ecce Homo*, date from his last and exceptionally productive period, the year 1888.

At the turn of the year (1888-89) Nietzsche broke down, probably from overwork; for, outwardly calm as his life had been, the philosopher had suffered most violent moral upheavals, and had moreover recorded his innermost experience in a brief space of time in a number of carefully thought out works. Another cause of his breakdown was probably his extreme loneliness; only in the last year of his conscious life was he "discovered" by the Danish-European critic and author, Georg Brandes; he himself had neither followers nor disciples. We may take him at his word when, on July 8, 1886, he writes to his sister:—"My health is really quite normal—only my soul is so sensitive and so full of longing for good friends of my own kind. Get me a small circle of men who will listen to me and understand me—and I shall be cured." Nietzsche lived on for another 12 years, first with his mother at Naumburg and, after the latter's death, with his widowed sister, Elizabeth Förster-Nietzsche at Weimar, where he died on Aug. 25, 1900. He was buried in the churchyard of Röcken.

The Message.—In order to understand Nietzsche's philosophy, which departs conspicuously from the orthodox and academic, it is necessary once more to make a profound study of his development. Nietzsche, it must be remembered, did not spin his view of life out of his inner consciousness, but lived and suffered it—a fact which explains both his language, free from learned jargon, and his half pathetic, half ironical style, which is yet always so full of poetry and metaphor.

Nietzsche, as we have seen, started his philosophical career with Schopenhauer—the philosopher who took such a gloomy and

despondent view of life that, at last, in wrath over his own aversions, he denied the will to life altogether. In the end Nietzsche came to regard Schopenhauer's principal work as the outpourings of a melancholy young man. Its author never fought his way through to cheerful maturity, but remained fettered to the doctrines he had laid down early in life. Nietzsche, whose motto was, "Only he who altereth remains unalterably mine," condemned this lack of capacity for development.

The changes in Nietzsche's own nature took place under the influence of Pre-Socratic antiquity; by this standard he weighed both Schopenhauer's and every other philosophy which either denied or was hostile to life. He saw that pagan antiquity had said "yea" to life; but that there had been, and now existed, other and different judgments and valuations of existence and "things." The attitude of civilization towards existence and "things," depended upon that civilization's values; and values may be either life-promoting or life-arresting.

The Good, The True and The Beautiful.—What are the ruling values of our civilization? Nietzsche replies, the ruling values of our civilization are those of the good, the true and the beautiful; which have ruled for thousands of years. All thinkers, including Plato, have acknowledged them as the highest. Nietzsche condemns these values as life-arresting; they are moreover quite illusory, for there is no instinct for goodness, truth and beauty. What does exist is another instinct—the will to power, the will to a stronger and higher existence. This will to power designates as good, true and beautiful, whatever is useful to the individual, whatever serves his advancement and enables him to establish his type by victory over others and using those others for his ends. Not goodness, truth or beauty *per se* determines what is good, true and beautiful, but something which lies behind goodness, truth and beauty, something which is higher, deeper, more important and more mighty than any of them, and uses "good," "true" and "beautiful," merely as means, as weapons to affirm and promote its own life and the lives of those that are like it—to wit, the will to power.

Good, true and beautiful are therefore not fixed values; they are relative, and there always stands behind them some human type, which by means of them is furthering its own ends. How came they to prevail as absolute values? How came they to prevail to such an extent that ultimately they were imposed upon all? "*Cui bono* were these values proclaimed?" Nietzsche asks. And he replies, "Even these, our present values, are the expression of a will to power—but of the will of the impotent, the humble, the feeble, the subjected, the peace-loving, who by means of these values wished to predominate and—have succeeded."

Our values "good," "true" and "beautiful," which led to Schopenhauer's philosophy and to the gloomy and disintegrated state of the world, came, according to Nietzsche, from the Jews. Among the Jews, the slave people of antiquity, arose the values which, with the help of religion and its moral content, still rule our present-day world. It is true that the Jews themselves once maintained a yea-saying attitude to the world. In the days of their prosperity, when they were still a triumphant and warlike people, ruled by capable kings, they too called "good" everything that was "bold," "vigorous," "joyful," "cruel" and "self-reliant." But ultimately these Jews fell under the heel of various foreign invaders, and their faith in the old natural values declined—but not their will to live, which now they fostered under a table of values and judgments the reverse of those they had formerly held.

Thenceforward they gradually and systematically demonetized "good." They called good all that was "cautious," "clever," "humble," "pacific," "mendacious" and "adaptable"; while their "evil" became everything that was "strong," "hard," "upright," "energetic," "exuberant" and "self-respecting." Thus, in the end, the Jews transvalued all values; thus they corrupted the master morality into the slave morality. "The Jews," says Nietzsche, "performed the miracle of the inversion of valuations; they led the slave-insurrection in morals. Jesus of Nazareth, this 'Redeemer,' bringing salvation and victory to the poor, the sick, the sinful—was he not really temptation in its most irresistible form, tempta-

tion to seize hold of those very Jewish values and new ideals? 'Sub hoc signo' Israel, with its slave morality, triumphed over the noble ideals of master morality. Under Israel's flag the people have triumphed, or the slaves, or the populace, or the herd, or whatever name you care to give them. The 'masters' have been done away with; the morality of the common man has triumphed."

Levelling.—The Jews thus bequeathed the values of their decadence to Christianity, and the latter, for its part, accentuated them, and spread them all over the world through many centuries of preaching and propaganda. Since the Crucifixion of Christ the noble have only been able to assert themselves for brief periods in Europe; i.e., at the Renaissance, under Louis XIV., and under Napoleon I. They were immediately suppressed by the Reformation, the French Revolution and the so-called Wars of Liberation against the "Corsican invader." All this occurred gradually, without mankind becoming aware of what had happened, so that the world never obtained a clear conception of how thoroughly it had been Semitized.

The 19th, Nietzsche's own century, which he assailed most wrathfully, had, according to him, finally let loose all these Christian instincts. These instincts, in their political disguise, dominate all modern movements—the labour, pacifist and feminist movements. "All distinctions must be removed," is the order of the day, even the natural distinction between man and woman. Yet, according to Nietzsche, the emancipation of woman can lead only to her enfeeblement and the destruction of her charm; and, therefore, only to defective offspring. If healthy children are to be produced, the differences between the sexes should be maintained, even deepened. But modern democracy will have nothing to do with differences, and in this demand is it not the legatee of Christianity? Christianity claims the equality of men before God, democracy, the equality of all men before the law. And as democracy derives from Christianity, so does socialism, which is little more than the Gospel in modern dress. For the Gospel was originally "the announcement that the road to happiness lies open to the poor and lowly—that all that is necessary is emancipation from institutions, tradition, and the tutelage of the ruling classes.

"This Christianity is no more than the typical teaching of the Socialists. Property, acquisition, fatherland, rank and position, courts of law, the police, State, Church, education, art, militarism: all these are so many obstacles in the way of happiness, so many mistakes, snares, and devil's artifices, on which the Gospel passes sentence—all this is typical of socialistic doctrine." (*Der Wille zur Macht*, Aphorism 209.)

The Will to Power.—Is there then no escape from this topsyturvy world? Is there no hope that other than Semitic values will once again prevail, and that other than "herd" men will be born? Are the "meek and the poor in spirit" always to be allowed to "have their say," and thus continue to "torture" the ears of him who "remembers with a shudder that mankind's fate depends upon the success of its highest types?"

To the anxious enquirer who puts this question, Nietzsche replies:—"Yes, there is a way, but new Gods, or resuscitated old Gods can no longer be of any avail. Our only hope lies in new men." And, according to him, these new men are already in process of formation. "The aspect of the European of to-day," says our philosopher, "makes me very hopeful. A daring and ruler race is building itself up, upon the foundation of an extremely intelligent gregarious mass. . . . The same conditions which go to develop the gregarious animal also force the development of the leaders." (*Der Wille zur Macht*, Aph. 955-56.) "While, therefore, the democratization of Europe will tend to the production of a type prepared for slavery in the most subtle sense of the term, the strong man will necessarily, in individual and exceptional cases become stronger and richer than he has perhaps ever been before. . . . The democratization of Europe is at the same time an involuntary preparation for the rearing of tyrants—taking the word in all its meanings, even in its most spiritual sense." . . .

For Nietzsche saw great dangers threatening both the 20th century and its successor. With them would come the classical era of great wars and revolutions, says this poet-philosopher, who, incidentally, was also a true prophet. In these wars and revolu-

tions (which by-the-bye he only foresaw and did not bring about as Allied War propaganda alleged), he welcomed a means for the masculinization of the world, the rearing of a higher type of man, and the creation of a new ruler caste.

For these, and these alone, he demanded emancipation from the Judaeo-Christian morality. Only to these higher and stronger men, from whom ultimately Superman was to spring, did he grant and recommend his famous formula of the transvaluation of all values:—"The aim should be to prepare a transvaluation of values for a particularly strong kind of man, most highly gifted in intellect and will, and, to this end, slowly and cautiously to liberate in him a whole host of slandered instincts, hitherto held in check: whoever meditates about this problem belongs to us, the free spirits—though not to that kind of 'free spirit' which has existed hitherto: for these desired practically the reverse." (*Der Wille zur Macht*, Aph. 957.) And in the very next aphorism he adds: "I am writing for a race of men which does not yet exist: for the lords of the earth." . . . "Live dangerously!"—this motto, which he himself lived up to, Nietzsche addresses to these future lords of the earth, while gladly conceding to others the right to strive for happiness and safety, and to cultivate domestic virtues. For, in all his writings, the philosopher emphasized that he had set up no moral code for the generality of men, and that he had no wish to lead lesser men away from their virtues and their duties. "I am a law only for mine own; I am not a law for all. He, however, who belongs to me must be strong of bone and light of foot,"—(*Also Sprach Zarathustra*).

The Rejection of Nietzsche.—An aristocratic doctrine like this, addressed to a self-confident democracy, inevitably met in the first place with misunderstanding, or, rather, with silence, then contempt, and finally with rejection. It was rejected all the more firmly, when, despite Nietzsche's warning, many uninvited guests pressed into his garden, and indulged their chaotic and rebellious instincts "beyond good and evil." Nietzsche himself had foreseen these unwanted disciples, and had warned the world as follows:—"The first followers of a Creed prove nothing against it." To these false followers, Nietzsche preferred his adversaries, among whom the true believers were by no means the worst.

But those he esteemed least were his former colleagues; for the ears of scholars and university professors were least attuned to his message. To these men, as has been well said, the new teaching was a "bolt from the blue": although even this was not entirely true; for, like every other thinker, Nietzsche of course had his predecessors, whom he expressly mentioned by name—Heraclitus, Empedocles, Spinoza and Goethe.

His doctrine fared just as badly with the politicians whom he offended, without exception, the conservatives by his revolutionary views, and the socialists by his conservatism. He arraigned no less all the religious sects and classes. Jew and gentile, man and woman, patriot and pacifist, were all criticized; for the roller of equality had levelled everything and everybody, and property constituted the only distinction—not, however, in Nietzsche's eyes; for he saw and asked: "Mob above, mob below! what to-day means poor or rich?" Thus, for the first 50 years after it was expounded, the teaching, despite the recognition of individuals, fell, as it were, between all stools; while its messenger by his countless opponents in every country, including Germany, was branded as misanthropist, madman, promotor of wars, infidel, dysangelist and corruptor of morals.

Nietzsche's Contribution.—A further and more dispassionate study of his philosophy must, however, lead to a different conclusion, particularly on the charge of irreligion, although it must be admitted that the firm rejection of Nietzsche's teaching by those who clung to the old beliefs is quite comprehensible. Nietzsche was a destructive genius of the first order, and his revolutionary movement could not but arouse suspicion and misunderstanding at the time. Men felt, if only unconsciously, the unprecedented acuteness and the novelty of his attack; for Nietzsche's vigilant eye descried all his opponents' weak points, and his psychological ruthlessness tore veil after veil from ideals cherished for centuries. Where his predecessors had seen virtues, he saw virtues, or the possibility of virtues; and where they had

seen virtues, he saw vices, or the possibility of vices. His attack on Christianity was much more thorough than that of Voltaire, whose "écrasez l'infâme!" had really done no more than assail the out-works of the Christian stronghold, its dogmas and ceremonies, without however aiming at the inner core of the Faith, the Christian ideal itself. Thus Nietzsche's rejection of all the values which had been held most sacred for centuries, inevitably made him the great solitary that he was. Such daring and scornful condemnation, such glacial negation, could not be understood at once, or greeted with applause, especially as at first his very motives remained obscure. Nobody understood in the early days that his teaching against pity sprang from his love of healthy life, against morality, from his love of a higher ethic, and against patriotism from his desire for a united Europe.

Late and slowly the world began, or is beginning to change its mind about "the anti-antichrist," and to perceive that he was not merely "anti"; but that the destroyer of the old tables of values was also a creator of new values. For in Nietzsche, destruction was accompanied by creation, wrath by blessing, and his vehement nay by an equally emphatic yea. His nay was directed at sickness, weakness and decadence, while his yea was for all those healthy instincts slandered and suppressed by the religion and morality up to his day. Nietzsche became the redeemer of these honest and virile instincts, and endeavoured to make their corresponding lordly virtues contribute to a great vision which he had had of the future. This vision, conceived in ecstasy, he depicted with the versatile talent of a scholar, a musician and a poet, and left to posterity a series of works which bear witness to his profound morality, and are to be regarded in the highest sense of the word, as religious.

BIBLIOGRAPHY.—*Translations.*—*The Authorized English Translation of Nietzsche's Works*, by Oscar Levy (1909-13, 18 vol.). A selection from the five-volume German edition of Nietzsche's letters, published under the title of *Selected Letters of Friedrich Nietzsche* (1921); Elizabeth Förster-Nietzsche, *The Young Nietzsche* (Eng. trans. by A. M. Ludovici, 1912); *The Lonely Nietzsche* (Eng. trans. by Paul V. Cohn, 1915); Daniel Halévy, *La vie de Nietzsche* (1909; translated by J. M. Hone, as *The Life of Nietzsche*, 1911).

Books about Nietzsche. The number of books written about Nietzsche in various languages is so vast that it is only possible to select a few, some of which will be found to take up a critical attitude towards the philosopher:—H. Lichtenberger, *La Philosophie de Nietzsche* (1898) trans. J. M. Kennedy as *The Gospel of the Superman* (2nd edition 1926); O. Levy, *The Revival of Aristocracy* (1906); J. M. Kennedy, *The Quintessence of Nietzsche* (1909); M. Mügge, *Nietzsche, his Life and Work* (1909); A. M. Ludovici, *Who is to be Master of the World?* (1909); A. M. Ludovici, *Nietzsche, his Life and Works* (1910); G. Chatterton Hill, *The Philosophy of Nietzsche* (1912); Georg Brandes (trans. by A. G. Chates), *Friedrich Nietzsche* (1914); A. Wolf, *The Philosophy of Nietzsche* (1915); J. N. Figgis, *The Will to Freedom, or the Gospel of Nietzsche and the Gospel of Christ* (1917); W. M. Salter, *Nietzsche, The Thinker* (1917); Charles Andler, *Nietzsche, sa vie et sa pensée*, 6 vols. (1920-28); J. Lavrin, *Nietzsche and Modern Consciousness* (1922); M. Havenstein, *Nietzsche als Erzieher* (1922); Amance, *Divinité de Frédéric Nietzsche: germe d'une religion d'Europe* (1925); Jules de Gaultier, *Nietzsche* (1926); Fritz Krökel, *Europas Selbstbesinnung durch Nietzsche* (1929).

(O. L.)

NIEUPORT (Flem. Nieuwpoort), a town of Belgium in the province of West Flanders. Pop. (1920) 3,016. It was the port of Ypres, and is situated on the Yser about 10 m. S. of Ostend. At one time Lombartzyde was the port of the Yser, but in the course of the 12th century mud was silted up, and ships went further south to Sandeshove, where it was more navigable. This place became the "Novus portus": Nieuport. It was strongly fortified in the middle ages and its siege by the French in 1488-89 is an episode of its heroic period. Under its walls in 1600 Maurice of Nassau defeated the archduke Albert and the Spaniards. It contains an ancient cloth market, a fine town-hall and an old church, and outside is a lighthouse dating from 1289. More than once in the course of its history, the town has been completely rebuilt, hence its draughtsboard plan, preserved even after the wholesale destruction of 1914-18.

Nieuport has one of the main artificial drainage outlets of the low country, the locks of Palingbrug. Since the World War they have been rebuilt in the form of six locks debouching on the canal of the Yser. They played an important part in the war,

being the instrument of the famous flooding of the front on the Yser on Oct. 29, 1914; all that was necessary to submerge a large part of the district, under the enemy's fire, was to reverse the normal process, i.e., to close the locks to the lower and open them to the higher water, so as to allow the tide to flow inland.

Nieuport Bains, 2 m. from the town, is a fashionable seaside resort dating only from 1869.

NIÈVRE, a department of France, formed from the old province of Nivernais with a small part of the Orléanais. It is bounded north-west by Loiret, north by Yonne, east by Côte d'Or, east and south-east by Saône-et-Loire, south by Allier and west by Cher. Pop. (1926) 260,502. Area 2,658 sq. miles. Nièvre falls into three regions. In the east are the granitic mountains of the Morvan, one of the most picturesque parts of France, containing Mont Prénelay (2,789 ft.) and several lesser heights. The north and centre are occupied by plateaux of Jurassic limestone with a maximum elevation of 1,400 feet. The west and south-western part of the department is a district of plains, composed mainly of Tertiary formations with alluvial deposits, and comprising the valleys of the Loire and the Allier. The lowest level of the department is 446 ft., at the exit of the Loire. Eastern Nièvre belongs to the upper basin of the Yonne, a tributary of the Seine, followed by the southern part of the Nivernais canal; western Nièvre drains towards the Loire, which crosses its south-western corner and then forms its western boundary.

The principal cereals are oats and wheat; potatoes and various kinds of forage are also largely grown. On the extensive pastures much cattle is fattened. The Nivernais and Charolais are the chief breeds. The rearing of sheep and draught-horses is also important. Vines are grown in the Loire valley and near Clamecy. The white wines of Pouilly are widely known. Nièvre abounds in forests, the chief trees being the oak, beech, hornbeam, elm and chestnut. Coal is mined at Decize, and gypsum, building stone, and kaolin are quarried. The best-known mineral springs are those of Pougues and St. Honoré. Nièvre is famous for iron-works, the most important being those of Fourchambault. At Imphy there are large steel-works. The government works of La Chaussade at Guérigny make chain-cables, anchors, armour-plates, etc. There are also manufactories of agricultural implements and hardware, potteries, manufactories of porcelain and faience (at Nevers) and glass works, tile-works, chemical works, paper-mills and saw-mills, as well as tanneries, boot and shoe factories, cask manufactories and oil works (colza, poppy and hemp). In the Morvan district the timber industry is important.

Much of the traffic is by water: the canal along the Loire runs through the department for 38 m., and the Nivernais canal for 78 miles. The chief railway is that of the P.L.M. Company, whose main line to Nîmes follows the valley of the Loire and Allier. Nièvre is divided into 3 arrondissements (Nevers, Château-Chinon and Clamecy being their capitals), 25 cantons, 313 communes. It forms the diocese of Nevers under the archbishop of Sens and part of the académie (educational district) of Dijon and of the region of the VIII. army corps. The chief towns are Nevers, the capital, Clamecy, Fourchambault, Cosne, La Charité and Decize. The appeal court is at Bourges.

NIFO, AGOSTINO [AUGUSTINUS NIPHUS] (1473?-1538 or 1545), Italian philosopher and commentator, was born at Japoli, Calabria. He lectured at Padua, Naples, Rome and Pisa, and was deputed by Leo X. to defend the Catholic doctrine of Immortality against the attack of Pomponazzi and the Alexandrists. In return for this he was made Count Palatine, with the right to call himself by the name Medici. He edited (1495) the works of Averroes; with a commentary compatible with his lately acquired orthodoxy. In the great controversy with the Alexandrists he opposed Pomponazzi's theory that the death of the body means the death of the soul. He insisted that the individual soul, as part of absolute intellect, is indestructible, and on the death of the body is merged in the eternal unity.

His principal philosophical works are *De immortalitate animi* (1518 and 1524); *De intellectu et daemionibus*; *De infinitate primi motoris quaestio* and *Opuscula moralia et politica*. His numerous commentaries on Aristotle were frequently reprinted, the best-known edition being printed at Paris in 1654 in 14 vols.

NIGDEH (Arab. *Nakidah*), the chief town of a vilayet in Asia Minor, situated on the Kaisarieh-Cilician Gates road. It is remarkable for the beauty of its buildings, dating from almost all ages of the Seljuk period. After the fall of the sultanate of Rum (of which it had been one of the principal cities), Nigdeh became independent, and, according to Ibu Batuta, ruinous, and did not pass into Ottoman hands till the time of Mohammed II. It represents no classical town, but, with Bor, has inherited the importance of Tyana, whose site lies about 10 m. S.W. A Hittite-inscribed monument, brought perhaps from Tyana, has been found at Nigdeh. The population (1927) is 59,289.

NIGEL (d. 1169), bishop of Ely, head of the exchequer in the reigns of Henry I. and Henry II., was brought into the exchequer in early life (1130). Soon after his uncle Roger of Salisbury secured him the bishopric of Ely, much to the disgust of the monks. Nigel incurred the suspicion of leaning towards the Angevin interest, when Roger of Salisbury and Alexander of Lincoln were arrested by Stephen (Jan. 1139). He attempted to maintain himself in his see by force of arms, but he was forced to fly to the empress at Gloucester. He was reconciled to Stephen in 1142 and restored to his see; but he now quarrelled with Henry of Winchester and was forced to go to Rome. Fortunately, he secured the strong and uniform support of the Roman Curia. At the accession of Henry II. (1154) Nigel was summoned to reorganize the exchequer. He was the only surviving minister of Henry I., and his knowledge of the exchequer business was unrivalled. This was the great work of his life. To the work of his son Richard, the *Dialogus de Scaccario*, we owe our knowledge of exchequer procedure as it was left by Nigel. The bishop took little part in politics, except as an administrator. In 1166 his health was broken by a paralytic seizure.

See F. Liebermann, *Einleitung in den Dialogus de Scaccario* (1875); J. H. Round, *Groffrey de Mandeville* (1892).

NIGER, a great river of West Africa, inferior only to the Congo and Nile among the rivers of the continent. Rising within 150 m. of the sea in the mountainous zone which marks the north-east frontiers of Sierra Leone and French Guinea, it traverses the interior plateaux in a vast curve, flowing north-east, east and south-east, until it finally enters the Gulf of Guinea through an immense delta. Its total length is about 2,600 miles. About 250 m. from its mouth it is joined by the Benue, coming from the east from the mountainous region of Adamawa. From its mouth to the limit of navigability from the sea the Niger is in British territory; above that point it flows through French territory. The area of the Niger basin is calculated at 580,000 sq. m. at least.

The source of the Niger lies in 9° 5' N. and 10° 47' W.; the most northerly point of the great bend is about 17° N. and the mouth is in 4° 30' N. 6° E. The river is known locally under various names, the most common being Joliba (a Mandingo word meaning great river) and Kworra or Quorra. By the last name the Niger was known in its lower reaches before its identity with the upper river was established. The Tembi, the stream considered the chief source of the Niger, issues from a deep ravine 2,800 ft. above sea-level where, from a moss-covered rock a spring issues and has made a pool below. The overflow forms the Tembi, which within a short distance is joined by two other rivulets, the Tamincono and Falico, which have their origin in the same mountainous district. After flowing north for about 100 m., the river turns eastward and at its confluence with the Tankisso (a northern tributary), 210 m. from its source, has attained dimensions sufficient to earn for itself the title Joliba. Taking at this point a decided trend northward, the Niger, 100 m. lower down, at Bamako has a depth of 6 ft. with a breadth of 1,300 feet. Seven or eight miles below Bamako the Sotuba rocks mark the end of what may be considered the upper river. Thirty miles below Sotuba are the rapids of Tulimandio; a little lower down is Kulikoro, from which point the bed of the stream for over 1,000 m. is fairly free from impediments.

Middle Niger and Lake Region.—The Niger here turns more directly to the east and increases in volume and depth. Below Sansandig the banks of the river become low and the

Niger is split up into a number of channels. Mopti is at the junction of the main stream with a large right-hand backwater or tributary, the Bani or Mahel Balevel, on which is situated the important town of Jenné. Below Mopti is a swampy and treeless region and the first of a series of lakes (Debo) is reached. These lakes are chiefly on the left of the main stream, with which they are connected by channels conveying the water in one direction or the other according to the season. At high water most of these are united into one general inundation. The largest lake, Faguibini, is nearly 70 m. long by 12 m. broad, has high shores and reaches a depth exceeding, in parts, 160 feet. It is not until Kabara, the port of Timbuktú, is reached, a distance of 450 m. from Sansandig, that the labyrinth of lakes, creeks and backwaters ceases. Below Kabara the river reaches its most northerly point. Here, and for some 500 m. down stream the river is bordered on the north by the Sahara; in places it is desert on both sides, with long lines of sand dunes. At Bamba it is shut in by steep banks, and narrows from 600 to 700 yd., again spreading out some distance down. At Tosaye (about 250 m. from Timbuktú) the stream turns distinctly south-east and preserves that direction throughout the remainder of its course. Here, just before the bend becomes pronounced, the Baror and Chabar rocks reduce the width of the river to less than 500 ft., and at low water the strength of the current is a serious danger to navigation.

At Ansongo, 430 m. below Timbuktú, the navigable reach of the middle Niger, in all 1,057 m., ends. Four huge flint rocks bar the river at Ansongo and effectually prevent further navigation except in very shallow draught vessels. From Ansongo to Say, some 250 m., the river presents a labyrinth of rocks, islands, reefs and rapids. From Say, where the stream is about 700 yd. in breadth, to Bussa, there is another navigable stretch extending 300 miles. After the desert region is past the Niger receives the waters of the river Sokoto, a considerable stream flowing from the north-east. Some distance below this confluence are the Bussa rapids. These rapids are of a more dangerous character than any encountered between Ansongo and Say. "In one pass, some 54 yd. wide, shut in between two large reefs, a good half of the waters of the Niger flings itself over with a tremendous roar" (Hourst). The rapids extend for 50 m. or more; in a less obstructive form they continue to Rabba.

Lower River and Delta.—A little above Rabba the river makes a loop south-west, at the head of the loop being (right bank) Jebba. Here there is an island in midstream, taken advantage of in the bridging of the river by the railway from Lagos. Sixty miles lower down is the mouth of the (left hand) tributary the Kaduna, a river of some magnitude whose head waters are not far from Kano. In 7° 50' N. 6° 45' E. the Niger is joined by its great tributary the Benue. At their confluence the Niger is about $\frac{3}{4}$ m. broad and the Benue rather more than a mile. The united stream forms a lake-like expansion about 2 m. in width, dotted with islands and sandbanks; the peninsula at the junction is low, swampy and intersected by numerous channels. The stream, as far south as Iddah (Ida), a town on the east bank, rushes through a valley cut between the hills, the sandstone cliffs at some places rising 150 ft. high. Between Iddah and Onitsha, 80 m., the banks are lower and the country flatter, and to the south of Onitsha the whole land is laid under water during the annual floods. Here may be said to begin the great delta of the Niger, which, extending along the coast for about 120 m., and 140 or 150 m. inland, forms one of the most remarkable of all the swampy regions of Africa. The river breaks up into an intricate network of channels, dividing and subdividing, and intercrossing not only with each other but with the branches of other streams, so that it is exceedingly difficult to say where the Niger delta ends and another river system begins. The Rio Nun is a direct continuation of the line of the undivided river, and is thus the main mouth of the Niger. From the sea the only indication of a river mouth is a break in the dark green mangroves which here universally fringe the coast. The crossing of the bar—where the depth of water is but 12 or 13 ft.—requires considerable care, and as other branches of the Niger afford better access the Nun mouth is now little used. East of the

Nun the estuaries known as the Brass, Sombrero, New Calabar, Bonny, Opobo (or Imo), etc. (with the exception, perhaps, of the first-named), seem to derive most of their water from independent streams. West of the Nun all the estuaries up to the Forcados seem to be true mouths of the great river. The Forcados has supplanted the Nun river as the chief channel of communication by water with the interior. The mouth of the Forcados is 2 m. wide, the bar, formerly but $\frac{3}{4}$ m. across, had by 1927 grown to $2\frac{1}{4}$ m. across, but the depth of water allowed vessels of 18 ft. draught to enter the river; within the bar is a deep water natural harbour of 3 to 4 square miles. Five miles up stream is the port of Burutu. From the mouth of the Forcados to the main stream is 105 m., with a minimum depth in the dry season of seven feet. The other western mouths of the Niger have as a rule shallow and difficult bars. The delta is the largest in Africa and covers 14,000 square miles, a larger area than the more famous Nile delta.

The Benue.—The Benue is by far the most important of the affluents of the Niger. The name signifies in the Batta tongue "Mother of Waters." The river rises in Adamawa in about $7^{\circ} 40'$ N. and $13^{\circ} 15'$ E., at a height of over 3,000 ft., being separated by a narrow water parting from one of the head-streams of the Logone, whose waters flow to Lake Chad. In its upper course the Benue is a mountain torrent falling over 2,000 ft. in some 150 miles. With the Chad system it is connected by the Kebbi or Mayo Kebbi, a river which issues from the south-west end of the Tuburi marshes, and eventually joins the Benue. The Tuburi marshes occupy an extensive depression in the plateau east of the Mandara hills, and are cut by 10° N., 15° E. The central part of the marshes forms a deep lake, whence there is a channel going northward to the Logone.

Below the Kebbi confluence the Benue, now a considerable river, turns from a northerly to a westerly direction and is navigable all the year round by boats drawing not more than $2\frac{1}{2}$ feet. At Yola, a town some 850 m. by river from the sea and at an altitude of 600 ft., the width of the stream at flood time reaches to 1,000 or 1,500 yd., and though it narrows at the somewhat dangerous rapids of Runde Gilla to 150 or 180 yd., it soon expands again. About 50 m. above Yola the Benue is joined by the Faro, a river rising in the Adamawa hills, and some 50 m. below Yola the Benue receives, on the right bank, the Gongola, which rises in the Bauchi highlands and after a great curve north-east turns southward. It is over 300 m. long, and at flood time is navigable for about half of its course. In its lower course the Benue is joined by several other streams; its valley is bordered by ranges of hills.

As the Niger and the Benue have different gathering grounds, they are not in flood at the same time. The upper Niger rises in June and decreases in December. The middle Niger, however, reaches its maximum near Timbuktu only in January and April—July is the low water season. The Benue reaches its greatest height in August or September, begins to fall in October, falls rapidly in November and slowly in the next three months, and reaches its lowest in March and April. The flood rises with great rapidity, and reaches 50, 60 or even 75 ft. above the low-water mark.

Below the Benue confluence the Niger is at its lowest in April and May; in June it is subject to great fluctuations; about the middle of August it usually begins to rise; and its maximum is reached in September. In October it sinks, often rapidly. A slight rise in January, known as the *yangbe*, is occasioned by water from the upper Niger. Between high and low-water mark the difference is as much as 35 ft.

History and Exploration.—Vague ideas of the existence of the river were possessed by the ancients. The great river flowing eastward reached by the Nasamonians as reported by Herodotus can be no other than the Niger. Pliny mentions a river Nigris, of the same nature with the Nile, separating Africa and Ethiopia, and forming the boundary of Gaetulia; and it is not improbable that this is the modern Niger. In Ptolemy, too, appears along with Gir (possibly the Shari) a certain Nigir (N'gaye) as one of the largest rivers of the interior; but so vague is his

description that it is impossible definitely to identify it with the Niger. Arabian geographers, such as Ibn Batuta, who were acquainted with the middle course of the river, called it the Nile of the Negroes. At the same time contradictory opinions were held as to the course of the stream. It was supposed by some geographers to run west, an opinion probably first stated by Idrisi in the 12th century. Idrisi gave the Nile of Egypt and the Nile of the Negroes a common source in the Mountain of the Moon. Fountains from the mountain formed two lakes, whence issued streams which united in a very large lake. From this third lake issued two rivers—the Nile of Egypt flowing north, and that of the Negroes flowing west (see R. Dozy and M. J. de Goeje's *Edrisi*, Leiden, 1866: *Premier Climat*, 1st four sections). From Idrisi's description it would appear that he regarded the Shari, Lake Chad, the Benue, Niger and Senegal as one great river which emptied into the Atlantic. From 1405 to 1413 a Frenchman, Anselme d'Isalguier, lived at Gao, a city on the Niger 400 m. below Timbuktu; the account of his travels was never printed and is lost. Knowledge of his adventures, never widely known, was completely forgotten until brought to light by Ch. de la Roncière (see his *Découverte de l'Afrique au Moyen Âge*, vol. iii., Cairo, 1927). Leo Africanus visited the Niger regions in 1513–15 without settling the question as to the direction of the river. The belief that a western branch of the Nile emptied itself into the Atlantic was held by Prince Henry of Portugal, who instructed the navigators he despatched to Guinea to look for the mouth of the river, and when in 1445 they entered the estuary of the Senegal, the Portuguese were convinced that they had discovered the Nile of the Negroes (see Azurara's *Discovery and Conquest of Guinea*, Beazley and Prestage's translation, vol. ii., London, 1899, chap. lx. and lxi., and introduction and notes). The Senegal being proved an independent river and the eastward flow of the Niger assumed, the theory that it ran into the Nile was revived.

That the vast network of rivers on the Guinea coast, of which the Nun was the chief, known as the Oil rivers, formed the delta of the Niger does not appear to have been suspected before the beginning of the 19th century. Consequently it was from the direction of its source that the river was first explored in modern times. In 1795 Mungo Park (*q.v.*), sent out by the African Association, landed at the Gambia, and struck the Niger near Segu on July 20, 1796, where he beheld it "glittering in the morning sun as broad as the Thames at Westminster and flowing slowly to the eastward" (*Travels*, 1st ed., p. 194). He descended the river some distance, and on his return journey went up stream as far as Bamako. In 1805 Park returned to Africa for the purpose of descending the Niger to its mouth. From Bamako he sailed down the river for over 2,000 miles and on the eve of the successful accomplishment of his undertaking lost his life during an attack on his boat by the natives at Bussa (Nov. or Dec. 1805). Park held to the opinion that the Niger and Congo were one river, though in 1802 C. G. Reichard, a German geographer, had suggested that the Rio Nun was the mouth of the Niger. Owing to Park's death the results of his second journey were lost, and the work had to be begun afresh. In 1822 Maj. A. G. Laing (who had reached Timbuktu by way of Tripoli) obtained some accurate information concerning the sources of the river, and in 1828 the French explorer René Caillié went by boat from Jenné to the port of Timbuktu. In 1826 Bussa was reached from Benin by Hugh Clapperton, and his servant Richard Lander. On Clapperton's death Richard Lander and his brother John led in 1830 an expedition which went overland from Badagry to the Niger. Canoeing down the river from Yauri—60 m. above Bussa—to the mouth of the Rio Nun they finally settled the doubt as to the lower course of the stream.

Heinrich Barth (1851–54) made known to Europe the course of the river from Timbuktu to Say. Later, the extension of French influence throughout the western Sudan led to an accurate knowledge of the river above Timbuktu. From 1880 onwards Col. (afterward General) Gallieni took a leading part in the operations on the upper river, where in 1883 a small gunboat, the "Niger," was launched for the protection of the newly

established French posts. In 1885 a voyage was made by Capt. Delanneau past the ruins of Sansandig, as far as Diafarabe. In 1887 the "Niger" made a more extended voyage, reaching the port of Timbuktu. A more important expedition was that of Lieut. Hourst, who, starting from Timbuktu in Jan. 1896, navigated the Niger from that point to its mouth, executing a careful survey of the river and the various obstructions to navigation.

In addition to the main stream, the Niger basin was made known during the last quarter of the 19th century and the early years of the 20th. The journeys of the German traveller G. A. Krause (north from the Gold Coast, 1886-87) and the French Capt. Binger (Senegal to Ivory Coast, 1887-89) first defined its southern limits by revealing the unexpected northward extension of the basins of the Guinea coast streams, especially the Volta and Komoe, a fact which explained the absence of important tributaries within the Niger bend. The exploration of the Benue dates from the middle of the 19th century. In 1851 Barth crossed the Benue at its junction with the Faro, but the region of its sources was first explored by the German E. R. Flegel (1882-84), who traversed the whole southern basin of the river and reached Ngaundere. The Benue itself had been ascended 400 m. by the "Pleiad" expedition in 1854 and in 1889 the river was traced to $13\frac{1}{2}^{\circ}$ E., and Kebbi to Bifara by Maj. (afterwards Sir Claude) Macdonald, further progress towards the Tuburi marsh being prevented by the shallowness of the water. In 1903, a French officer, Capt. E. Lenfant (who had in 1901 succeeded in navigating the Bussa rapids on the Niger) ascended the Kebbi and discovered the Lata fall, continuing up the river to its point of issue from Tuburi. Crossing the marshes he found and navigated the narrow river leading to the Logone. Save for the portage round the Lata fall the whole journey from the mouth of the Niger to Lake Chad was made by water.

From Kulikoro (which is connected by railway with the port of Dakar) downward, the French have undertaken works on the Niger with a view to deepening the channel, and they maintain a regular steamer service to the port of Timbuktu. In 1910 the British began dredging with the object of obtaining in the lower river a minimum depth of 6 ft. of water; however, while there is still a large river traffic the building of railways in Nigeria has deprived the lower Niger and the Benue of their importance as highways of commerce to the far interior.

An *Atlas du cours du Niger de Timbouktou aux rapides de Bousa* in 50 sheets on the scale of 1:50,000, by Lieut. Hourst and others, was published in Paris in 1899. (F. R. C.)

NIGERIA, a British colony and protectorate in West Africa, occupying the basin of the lower Niger and adjacent regions. Area 335,700 sq.m.; pop. (1928) about 19,000,000. Administratively attached to Nigeria is that part of the Cameroons under British mandate, which has an area of some 32,300 sq.m. and a population of about 370,000. Nigeria is bounded south by the Gulf of Guinea; west by Dahomey, north by the French Niger Colony; and east by the French sphere of the Cameroons. It

includes the former British colony and protectorate of Lagos (*q.v.*), and is nearly seven times the size of England. The following particulars do not include the British sphere of the Cameroons (*q.v.*).

Physical Features.—Nigeria is divisible, broadly, into zones parallel with the coast: (1) the delta, (2) forest region, (3) a zone of comparatively open country giving place to (4) the plateau region. The coast-line, some 500 m. in length, extends along the Gulf of Guinea from $2^{\circ} 46' 55''$ E. to $8^{\circ} 45'$ E., ending at the Rio del Rey, where the great bend eastwards of the continent ceases and the land turns south. The Niger (*q.v.*), which enters the country at its north-west corner and flows thence south-east to the Atlantic, receives, 250 m. from the sea, the Benue, which, rising in the mountains of Adamawa south of Lake Chad, flows west across the plateau. Into the huge delta of the Niger several other rivers (the "Oil Rivers") empty themselves; the chief being, on the west, the Benue (*q.v.*), and, on the east, the Brass. East of the Niger delta is that formed by the Imo or Opo, Bonny and other streams, and still farther east is the Calabar estuary, mainly formed by the Cross river (*q.v.*).

The delta region is swampy, and forms, for a distance of from 20 to 60 m. inland, a network of interlacing creeks and broad sluggish channels fringed with monotonous mangrove forests. Beyond the delta firm ground takes the place of mud and the mangroves disappear. The land rises gradually at first, becoming, however, in many districts very hilly, with heights of 3,000 ft., and is covered with dense evergreen or rain forests which give place to deciduous forest as the rainfall decreases. The evergreen and deciduous forests form part of the great West African forest belt; the trees are straight, tall and cylindrical and there is little undergrowth, though often bound together by creepers. The forest belt extends 50 to 100 m. and is succeeded by park-like land, the savannah and orchard forests much more extensive than the dense forest, with strips of deciduous forest going through it along the river banks.

North of the Niger-Benue confluence, which is but 250 ft. above sea-level, are hills forming the walls of the plateau which extends over the major part of the country and is part of the great plateau of North Africa. This plateau, broken only by the valleys of the rivers, does not attain an elevation approaching that of the plateaux of South Africa, the culminating point (apart from particular mountain districts), situated in about 10° N., reaching a height of 3,000 ft. only. The valleys of the Niger and Benue, especially the latter, are much lower, the town of Yola on the Benue, some 400 m. inland, lying at an altitude of little over 600 feet. The surface is generally undulating, with isolated "table mountains" of granite and sandstone often rising abruptly from the plain. It is clothed largely with thin forest, but becomes more open to the north until, towards the French frontier, the arid steppes bordering the Sahara are reached. Much of the country north of Zaria (11° N.) is covered with heavy, loose sand. The most mountainous districts are northern Bauchi (a little N. of 10°), where there are heights of 6,000 ft. or more; parts of Muri, along the north bank of the Benue; and the southern border of the Benue basin, where the hills consist of ironstone, quartz and granite. On the east the plateau sinks to the plains of Bornu (*q.v.*), which extend to Lake Chad. Tributaries of the Niger traverse the western portion of the country, the most noteworthy being the Gublin Kebbi, or Sokoto, river and the Kaduna, which flows through a valley not more than 500 ft. above the sea. The north-eastern part of the country drains to Lake Chad by the Waube or Yo, an intermittent stream, which in its lower course forms the Anglo-French boundary. The western portions of Lake Chad (*q.v.*) belong to the protectorate, which contains no other large lake. The water parting between the Chad and Niger systems runs north-west and south-east from about Katsina in 13° N. to the Bauchi hills.

Geology.—Except in the coast belt, which is composed of superficial deposits, crystalline rocks are the fundamental formation. From the edge of the coast belt to near the Niger-Benue confluence, these rocks are overlain by unfossiliferous sandstones, lying undisturbed, and possibly of the age of the sandstone of the

Congo basin. Much of the plateau—with its flat-topped hills and red earths—consists of what is called the fluvio-volcanic series. The alluvial deposits here are often unconnected with the present drainage lines. On the Bauchi plateau are large deposits of cassiterite (tin) mostly found in the detrital deposits resulting from the great denudation over the plateau. Limestones, with fossils indicating a Tertiary age, have been found near Sokoto. Recent alluvium and a thick deposit of black earth border the upper reaches of the Benue and cover wide areas around Lake Chad. Coal measures are found in the Enugu district east of the Niger and south of the Benue, and in the Bende district near the Cross river; there are large deposits of lignite in the younger Tertiary group in the Niger valley and in the neighbourhood of the Benue, where they are interstratified with white clays; rock phosphates are found north of Lagos and there is a belt of auriferous country north of Minna (towards the Kaduna river).

Climate.—Though Nigeria lies wholly within the tropics, there is a distinct difference in the climate of the northern and southern regions. In the south the climate is typical of the tropics; in northern Nigeria it resembles that of Egypt and may be described as sub-tropical. In the south the temperature varies comparatively little, from 70° to 100° F, and averages over 80° F. The air is both hot and humid; the rainy season is sometimes prolonged to ten months or more, the rainfall in the delta being from 100 to 140 or more inches a year. (At Bonny in 1923 the fall was 150·59 in., rain occurring on 151 days.) The prevailing wet season wind is from the south-west. From November to March the *harmattan*, a dry, dust-laden north-east wind, coming from the Sahara, blows intermittently, and this is the dry season, when at Lagos humidity has been known to fall to 26% against a mean of 90%. At Lagos the usual rainfall is 77 in. a year. Tornadoes occur at the beginning and end of the *harmattan*. Malaria is still a scourge in these southern districts and the country is unhealthy for Europeans. In the north the temperature is still high, but for nine months of the year the air is dry, "the dry air of the desert, the intense parching dryness of which is almost inconceivable by anyone who has not experienced it" (O. T. Faulkner, director of agriculture, Nigeria). July–September are the rainy months in the north, the fall being usually 25 to 30 in. a year, though in places it is as much as 60 inches. The *harmattan* begins in the north in October and lasts till April. In this season variations in temperature are great. At Hadeija, in 1922, a minimum of 35° F and a maximum of 115° F were recorded. In some parts of the plateau Europeans can live in comparative comfort, the climate resembling that of an unusually fine English summer, often with cool nights. Between the southern and northern regions there is an intermediate zone with a normal rainfall of from 40 to 50 in. a year and still considerable humidity.

Fauna and Flora.—There are many large and small mammals. They include the elephant, lion, leopard, giraffe, West-African buffalo, many kinds of antelope and gazelle and smaller game. The chimpanzee, the drill ape, the baboon and many kinds of monkeys are found in the forests and snakes are common. There are many varieties of squirrel, some finely coloured. The camel is found in the northern regions. In the rivers are rhinoceros, hippopotamus and crocodile. The manatus is also found. The birds include the ostrich, marabout, vultures, kites, hawks, ground hornbill, great bustard, guinea fowl, partridge, lesser bustard, quail, snipe, duck, widgeon, teal, geese of various kinds, paraquets, doves, blue, bronze and green pigeons and many others. Domestic animals include the horse and donkey in the plateaux, but baggage animals are rare in the coast-lands, where the tsetse fly is found. Mosquitoes are abundant throughout the delta. There are the remarkable hammer-headed fruit-bat and other varieties of bats and a curious kind of dormouse. Many species of butterfly and spiders are recorded.

The mangrove is the characteristic tree of the swamps. North of the swamps the oil palm (*Elaeis guineensis*) flourishes abundantly. It is common as far as about 7° N. The evergreen and deciduous forests contain a great wealth of timber. Among the trees are mahogany, cedars and scented cedars, walnut, rosewood, satinwood, ebony, African teak and other valuable species. There

are also African maple, shingle-wood, cork-wood, cotton-wood and other general utility woods, including the *abura* whose timber is acid resisting. Rubber vines are also found in these forests. Other trees found, chiefly on the plateaux, are the baobab, the shea-butter tree, the locust tree, gambier, palms, including the date and dum palm (*Hyphaene*), the tamarind, and, in the arid regions, the acacia and mimosa.

Inhabitants.—The vast majority of the inhabitants are typical negroes. In the south-west the Yorubas (*q.v.*) are the chief race. They occupy the country behind the coast-lands, from Dahomey to Benin, and have a considerable degree of civilization. In the delta district and the forest zone, besides the people of Benin, are the Jekri, living on the lower part of the Benue river and akin to the Yorubas, the Ijos, living in the delta east of the main mouth of the Niger, and the Ibos, occupying a wide tract of country just above the delta and extending east from the Niger to the Cross river. South of the Ibos live the Aros, a tribe of relatively great intelligence, who dominated many of the surrounding tribes and possessed an oracle or *ju-ju* of reputed great power. On the middle Cross river live the Akuna-kunas, an agricultural race, and in the Calabar region are the Efiks, Ibibios and Kwas. All these tribes are fetish worshippers, though Christian and Muslim missionaries have made numerous converts. The Efiks, a coast tribe which early came into contact with white men, have adopted several European customs, and educated Efiks are employed in Government service. The great secret society called Egbo (*q.v.*) is an Efik institution.

In the northern parts of Nigeria the inhabitants are of more mixed blood, owing to the invasion of Fula, Berber and Arab or Arabized people. But the bulk of the people are negroes. The most important of these negro peoples are the Hausa (*q.v.*), among whom the superior classes adopted Mohammedanism in the 13th and 14th centuries. The Hausa are keen traders and make excellent soldiers. The Fula tribe, besides providing the ruling families in many of the Hausa States, form a separate caste of cattle-rearers. Arab merchants live in some of the larger Hausa towns.

In general, the people living in the river valleys have been little or not at all affected by Muslim propaganda, either in blood or religion. Thus along the banks of the Niger, Benue and other streams, the inhabitants are negro and pagans, and generally of a primitive though often rather fine type. Of these the Munshi, who inhabit the district nearest the junction of the Benue with the Niger, were long noted for their intractability and hostility to strangers, whom they attacked with poisoned arrows. The Yorag-

FROM E. D. MOREL, "NIGERIA"
A GROUP OF HAUSAS CARRYING THE SHORT-HANDLED HOES IN THE ANCIENT HOE DANCE

hums, their neighbours, were cannibals. Nearer Yola live the Battas, who also had a bad reputation. In the central hilly region of Kachia are other pagan tribes. When first met by Europeans they wore no clothes, and their bodies are covered with hair. South of the Benue, near the Niger confluence, dwell the Okpotos, Bassas and other tribes, which had a reputation for savagery and war-lust. In the districts of Ilorin and Borgu, west of the Niger, the inhabitants are also negroes and pagan, but of a more advanced type than the tribes of the river valleys. According to some native traditions, the people of Borgu claim to have a Coptic

origin. In Bornu (*q.v.*) the population consists of (1) Berberi or Kanuri, the ruling race, containing a mixture of Berber and negro blood, with many lesser indigenous tribes; (2) so-called Arabs, and (3) Fula.

A complete list of the tribes in Nigeria would run into many scores, and each has its separate language. In the old province of Bauchi alone as many as 60 different languages are spoken. The most widely diffused languages are Hausa and Yoruba. Arabic is the court and official language in the Fula emirates. In the ports many natives speak English.

The European inhabitants number (1929) some 5,000. They are chiefly officials, traders and missionaries. On the tin-fields are some 700 whites including over 100 women.

Chief Towns.—A large proportion of the people are town-dwellers. The ports, with the exception of Lagos, are all on the rivers. From west to east the ports reached by ocean steamers are Lagos (*q.v.*), the capital of Nigeria; Forcados, at the mouth of the Forcados branch of the Niger and the main port of entry for the river, having 18 ft. of water over the bar; Burutu, 5 m. above Forcados and the port of the Niger Co.; Warri 30 m. above Forcados; Koko and Sapele, on the Benin river, but reached by way of Forcados. All these ports are west of the Nun mouth of the Niger, where on the west bank is Akassa (14 ft. of water). West of the Nun mouth are Brass town (on the Brass river) and Bonny, at the mouth of the Bonny river. The three last-named ports, once flourishing, are now little used. Some 40 m. up the Bonny river is Port Harcourt (*q.v.*), second in importance of the ports of Nigeria. Farther east are Opobo (13 ft. of water), on the Imo river, richest of the oil-rivers of Nigeria, Degema (18 ft.), and Calabar (*q.v.*). On the river Niger, at the head of the delta, are Asaba (west bank) and Onitsha (east bank); farther north is Idah (east bank) in the palm-oil zone; Lokoja (*q.v.*) is at the Niger-Benue confluence; Baro, 70 m. above Lokoja, is on the railway system; and still farther north, on the river, are Egga, Jebba and Bassa (*q.v.*).

The largest cities are found in Yorubaland. Of these Ibadan (pop. about 240,000), the largest native city in Africa, Ilorin and Abeokuta are separately noticed. Other Yoruba cities are Ogbomosho (pop. 85,000), Oshogbo (pop. 51,000), Iwo (53,000), Ede (48,000) and Ogo (40,000). Other towns in the south are Benin (*q.v.*), west of the Niger and Bende, and Enugu, east of the river. Enugu (pop. 40,000) is the centre of the Udi coalfield.

In northern Nigeria, where the larger towns have generally a population of from 40,000 to 50,000, the chief city is Kano (*q.v.*), the commercial capital, situated in 12° N., 8° 32' E. Sokoto, the religious and political centre of the Fula, is some 220 m. W.N.W. of Kano. Katsina (*q.v.*), near the frontier and 84 m. N.W. of Kano, has a reputation as an educational centre; other chief Hausa towns are Zaria (*q.v.*), Bauchi (or Yakoba); Beda; and Yola (*q.v.*). The chief towns of Bornu are Kukawa or Kuka (*q.v.*), near Lake Chad, Maidugari and Dikwa (Dikoa). The administrative capital of northern Nigeria is Kaduna; Jos, a modern town with European amenities, is the centre for the Bauchi tin-fields.

Communications.—Railways are now the chief means of transport, the shallowness of the Niger and Benue for a large part of the year rendering them an uncertain means of communication. There is still, however, a considerable river traffic, and in the delta the rivers remain the great highways. There is a regular steamer service between Forcados and Lagos, and between Lagos and Dahomey by the lagoons. From Forcados two steamers ascend the main Niger to Jebba, a distance of 530 miles. On the Benue there is steamer traffic as far as Yola. But between May and October navigation is only possible to vessels drawing not more than 3 ft. of water. There are navigable stretches of several other rivers—the Cross river can be ascended for 240 miles. For the main part the river services are (except in the delta) auxiliary to the railways.

Railway building began in 1896, with a line from Lagos to Ibadan, a distance by rail of 123 miles. This line was finished in 1900. In 1906 a forward policy was adopted, and since then progress has been rapid. The railways have been built and are owned and worked by the Nigerian Government and are of the standard

African 3 ft. 6 in. gauge, unless otherwise stated. In 1929 some 1,900 m. of railway were open, the system consisting of:—(1) A western line running from Lagos to Kano (705 m.), via Abeokuta, Ibadan, Ilorin, Kaduna and Zaria. The Niger is crossed at Jebba—where there is an island—by two bridges, together 1,795 ft. long. The bridges, the last part of the line to be built, were completed in 1914. A branch line (111 m.) runs from Minna to Baro, on the Niger. Another branch line runs from Zaria, by Guasu to Kaura Namoda (142 m.), and in 1928–29 the main line was extended from Kano to Hadejia (102 miles). (2) An eastern line (built 1913–26) from Port Harcourt to Enugu, for the Udi coalfields, and Kaduna (569 m.), where it joins the western railway. The Benue is crossed at Makurdi, pending the completion of a bridge, by train ferry. A short branch line running to Jos, for the tin-fields, was opened in April 1927, and since then all the tin is sent to Port Harcourt. Jos was formerly served by a light line (2 ft. 6 in. gauge) from Zaria, on the western railway. This light line now carries cotton. In 1928 the building of a trunk railway to Lake Chad, at an estimated cost of some £5,000,000, was sanctioned. The capital cost of the railways, up to March 1928, had been £18,104,000 of which sum £15,245,000 had been raised by loan on the London market, at an average rate of interest under 5%. The railways are worked as a business concern, but the ultimate profits go to the colonial treasury. Motor traffic has to a large extent superseded other methods of road travel. Some 3,000 m. of all-the-year-round motor roads were being maintained in 1928 by the Public Works Department alone. There are, additionally, many miles of dry-season motor roads in the north.

There is regular steamship communication by several lines between Europe and Lagos and other Nigerian ports; direct cable communication with Europe and South Africa, an extensive system of inland telegraphs, and a wireless station at Lagos. The principal passenger and mail service is by the Elder Dempster line from Liverpool to Lagos, the voyage taking 15 days. A regular service between British ports and Nigeria has been maintained since 1852.

Administration.—The country is divided into three parts; the colony of Nigeria (the old Lagos colony) with an area of 1,400 sq.m. only; and the northern and southern provinces (78,600 sq.m. and 255,700 sq.m. respectively) which form the Protectorate of Nigeria. At the head of the administration is a governor; there is a lieutenant-governor for the northern and for the southern provinces, and, since Oct. 1927, a separate administrator for the colony. Certain important services, *e.g.*, the railways, function throughout Nigeria. The governor, whose headquarters are in Lagos, is aided by an executive council of officials, and for the colony and the southern provinces there is a legislative council on which, since 1923, elected members have sat to represent the towns of Lagos and Calabar. (The franchise is conferred on adult males with an income of £100 a year or more.) On the council are also members nominated by various commercial bodies and others nominated to represent African interests. The legislative council is given control of expenditure in the northern provinces derived from the revenues of the central Government. The number of provinces has varied from time to time. As far as possible the system of indirect rule is observed; that is, the native governments existing before the British occupation are retained, each with its own treasury and judiciary, the rulers being guided by the advice of a British resident, under whom are district officers. This indirect rule prevails in almost all the northern provinces and also in Yorubaland. In these native states direct taxation and a fixed income for the emirs and other paramount chiefs has led to the abolition of many abuses. Fifty to 70% of the direct tax goes to the native treasuries.

Education and health are departments of primary value. There are Government elementary and technical schools, and King's college, Lagos, founded 1909, provides secondary education. At Katsina is a training college for native teachers, opened 1922, and there are training colleges in southern Nigeria, including two for women teachers. Education remained, however, chiefly in the hands of Christian missions; the Hope Waddell institute at Calabar, a Scottish missionary enterprise, has a high reputation for

industrial training. Both the missions and State schools now pay special attention to practical agricultural training. Some of the native administrations have their own schools. The Yoruba have for long shown an eagerness for education; after the World War the demand for education among the natives generally greatly increased. The health department has done a great and successful work in fighting malaria, dysentery, yellow fever and plague, and in insisting upon better housing and better food for Europeans. As one result the death rates of whites fell between 1903 and 1926 from over 20 per 1,000 to under 9 per 1,000.

Before amalgamation the administration of northern Nigeria required grants-in-aid to meet expenses, which were partly furnished by her richer neighbour, southern Nigeria. Since amalgamation, Nigeria has been self-supporting, though revenue in some years falls short of expenditure. In 1914 revenue was £3,048,000 and expenditure £2,967,000; in 1923-24 revenue had risen to £6,260,000 and expenditure to £5,501,000. The figures for 1926-27 were, revenue £7,734,000, expenditure £7,584,000. Revenue is derived from customs duties on imports fixed at 15% *ad valorem* in 1922; on the chief exports (this duty was first imposed in 1916); by direct taxation; and, in the colony only, and since 1927, income tax. It may be noted that a special West African currency is in circulation and that for purposes of trade between natives it has been necessary to mint a coin valued at one-tenth of a penny. The Bank of British West Africa and the Colonial Bank have agencies in the chief towns. British weights and measures are in use.

Economic Conditions.—There is a very large internal trade, as to which no statistics are available, but it is believed to exceed in value the external trade. The great majority of the people are agriculturists, including, in the north, cattle-rearing. Native manufactures are of minor importance—they include in the Hausa States the making of "Morocco" leather; mining (tin and coal) owes its development to the British. Fishing is largely followed in the delta. In a broad generalization the products of southern Nigeria are sylvan, palm oil and palm kernels taking the leading place. Cocoa and cotton are other products. From the middle belt come henniseed and shea-butter—both adding to the oil output. From northern Nigeria come groundnuts (a basis for margarine), hides and skins, cattle, and, in increasing quantities, cotton. (Cotton and maize are the only crops common to the northern and southern provinces.) Add to the products named coal and tin and timber, and the leading exports have been stated.

The coast peoples, since the 15th century, had traded directly with the European merchants who came to their ports, but the dense forest belt cut off intercourse with the interior—though the Niger and Benue might have afforded means of penetration. But up to the middle of the 19th century the trade of Hausaland and Bornu (that is northern Nigeria) was either with the Mediterranean by caravan across the Sahara, or east and west to other parts of the Sudan. Direct, but, at first, very limited, trade with the interior followed the efforts of the British government and merchants to open up the country by sending expeditions up the Niger and Benue. Modern developments date from the founding of the Royal Niger company by Sir George Goldie and the conquest of the Fula emirates by Sir F. D. (Lord) Lugard. (See p. 442, *History*.) The trade of Lagos and the oil rivers, the last the eastern part of southern Nigeria, partly through having been long established, was, up to 1928 at least, more valuable than that of northern Nigeria, which contains large areas sparsely peopled and little cultivated, and was not fully opened to trade with the south until the beginning of the 20th century. (This trade via the Gulf of Guinea, together with minor causes, almost killed the trade via the Sahara.) In 1901 when the total external trade of the southern regions was valued at over £4,000,000 that of northern Nigeria was probably (statistics are lacking) not £250,000. With the completion of the railway to Kano in 1911, there was a great increase in trade in the north. Since the amalgamation of southern Nigeria (including Lagos) with northern Nigeria in 1914 statistics are given for the country as a unit. In that year the imports were valued at £6,276,000 and the exports at £6,420,000. In 1924, when normal conditions following the World War were considered to be restored, the figures were:—

imports £10,948,000; exports £14,460,000. In 1927 the external trade was nearly £30,000,000—imports being £14,146,000 and exports £15,654,000. These figures exclude specie.

Almost all sylvan and agricultural work in Nigeria is done by native owners, peasant farmers with small holdings, usually about 3 acres. The main concern of the farmer is to produce food crops—guinea corn and millet, yams and bananas, and maize—for himself and his family; he works for sale only in his spare time and to get luxuries. The great occupation in the delta is the production of palm oil and palm kernels. The yearly export is about 100,000 tons of oil and double that weight of kernels. Native methods of treating the fruit waste about half of the oil; up to 1928 only one factory had been started to deal with the fruit. Cocoa plantations were started in south Nigeria about 1905; the production of cocoa grew by 1928 to 40,000 tons in the year. Cotton growing for export dates from the early years of the 20th century; in 1912 an American variety of cotton was introduced and found suitable. In the centre and south a native cotton is also grown for export. By 1925 the export had reached 35,000 bales; two or three poor seasons followed; the 1925 output was nearly reached again in 1928, and the acreage under cotton increased. Many gineries have been set up. The cultivation of groundnuts in northern Nigeria—climate and soil are well suited to the crop—grew rapidly with increased transport facilities. In the year 1927-28 (April and March inclusive) the railways carried 96,000 tons of nuts as against 4,800 tons of cotton. Generally, farming in Nigeria is not on a high level, partly because fertilizers are not used. The exhaustion of much land within easy reach of transport caused grave concern to the Government which from 1926 onward took measures to instruct the farmers in the use of manures and other fertilizers. There are, however, good stock farms in the north with large herds of cattle and flocks of sheep and goats.

The chief industries which are owned by Europeans are the tin and coal mines. The ascertainment of the richness of the tin-fields in Bauchi in 1902 led to a speedy development of the mines (which employ 30,000 to 35,000 natives), and the output of coal from Ude, which began in 1915, is of much importance. The coal mines are worked by the railway department for the Government; they supply the fuel for the tin mines, for their own railway and for the Gold Coast railways, and still have a surplus for the Government marine and the shipping companies. The output for the year ended March 31, 1928, was 345,000 tons. The tin-fields (see BAUCHI) are worked by private enterprises, mostly for companies registered in London. The timber-cutting concessions are also in the hands of Europeans. There are 200,000 sq.m. of forest in Nigeria; the timber exported is mainly mahogany, cedar and walnut, the mahogany chiefly from the Benin forests. Gum arabic is obtained from Bornu and other northern provinces. "Wild" rubber is still tapped, and plantation rubber is exported. The relative value of the chief exports is shown in the following figures for 1927:—Palm oil, £3,617,000; palm kernels, £4,574,000; groundnuts £1,633,000 (£2,342,000 in 1926); cocoa, £1,968,000; cotton lint, £611,000 (£1,182,000 in 1926); tin, £2,403,000.

The imports are of a most miscellaneous character; they may be classed under the main heads of cigarettes, cotton goods (both from the United Kingdom), provisions, hardware, salt, kola nuts (from the Gold Coast), petrol, and alcoholic liquors (mostly gin from Holland). (Though the import of "trade spirits" has been prohibited since 1919, and no alcoholic liquors, save for Europeans, are allowed into northern Nigeria, the growing wealth of the natives of southern Nigeria led to an increased demand for ordinary spirits and beer.) With regard to the direction of trade the figures for 1927 showed that 53.5% was done with the United Kingdom—which supplied 62% of the imports and took 45.6% of the exports. In that year Germany had 15% and the United States 10% of the total trade. Of the exports the palm kernels—largely used as cattle food—go to Germany and England, and the groundnuts to Germany, 60%, and France. The United States supplies kerosene, petrol and unmanufactured tobacco, and takes about 25% of the palm oil, and 30% of the cocoa.

BIBLIOGRAPHY.—*Handbook for Nigeria*, 7th ed. (1926), Sir W. M. N. Geary, *Nigeria under British Rule* (1927); the annual reports published by the Colonial Office, London; *The Times* West African Supplement, Oct. 30, 1928. (F. R. C.)

Defence.—With a population approaching 19,000,000, order is maintained in Nigeria, and defence provided for the colony, by the Nigeria regiment of the West African frontier force (see GREAT BRITAIN: *Colonial Forces*). This force, which was raised in 1901, consists of officers and non-commissioned officers of the British Army and other ranks recruited locally for 6 years with the colours and 3 in the reserve, with facilities for re-engagement. Training is on the lines of the British army. Regimental transport is by native carriers; transport animals are not used. The Nigeria regiment includes 1 battery of artillery (3.7 inch howitzers), 4 battalions of infantry, 1 light mortar unit, a signal school, and a depot. The establishment is 3,590, with a reserve of 682. There are also armed police with an establishment of 1,260 in the northern provinces, 2,105 in the southern. These police are liable for military service, and distributed in 7 territorial divisions, each under a senior commissioner.

HISTORY

Of the early history of the races inhabiting the coast lands little is known. The Beni appear to have been the most powerful race at the time of the discovery of the coast by the Portuguese in the 15th century, and the kings of Benin in the 17th century ruled a large part of the south-western portion of the existing British protectorate (see BENIN). The Benin influence does not seem to have reached east of the Forcados mouth of the Niger. In the greater part of the delta region each town owned a different chief and there was no one dominant tribe. Among these people, who occupied a low position even among the degenerate coast negroes and who were constantly raided by the more virile tribes of the interior, trading stations were established by the Portuguese, and later on by other Europeans, British traders appearing as early as the 17th century. There was no assertion of political rights by the white men, who were largely at the mercy of the natives and who rarely ventured far from their ships or the "factories" established on the various rivers.

By the end of the 18th century British enterprise had almost entirely displaced that of other nations on the Niger coast. But the principal trade of all Europeans was still in slaves. After the abolition of the slave-trade in the 19th century palm oil formed the staple article of commerce, and the various streams which drain the Niger coast near the mouth of the great river became known as the "Oil rivers." The opening up of the interior was in the meantime promoted, chiefly by the efforts of British travellers and merchants. Mungo Park traced the Niger from Segu to Bussa, where he lost his life in 1805. From Bussa to the sea the course of the river was first made known in 1830 by the brothers Richard and John Lander. Maj. Dixon Denham and Capt. Hugh Clapperton entered the country now known as Northern Nigeria from the north in 1823, crossing the desert from Tripoli. Clapperton in 1826-27 made a second journey, approaching the same territory from the Guinea coast. Dr. Barth, travelling under the auspices of the British Government, entered the country from the north and between 1852 and 1855 made the journeys whose record still remains the principal standard work for the interior. Macgregor Laird first organized in 1832 the navigation of the River Niger from its mouth to a point above the Benue confluence. During the next 25 years expeditions were despatched into the interior and a British consul was posted at Lokoja. Possession was also taken, in 1861, of Lagos island, with the object of checking the slave traffic still being carried on in that region. But the deadly climate discouraged the first efforts of the British Government, and, after the parliamentary committee of 1865 had recommended a policy which would render possible the ultimate withdrawal of British official influence from the coast, the consulate of Lokoja was abandoned, but re-established a few years later to meet the still steadily growing requirements of British trade upon the river.

The Royal Niger Company.—In 1880 the international

"scramble for Africa" led to the establishment under the recognized protection of the French Government of two French firms which opened upwards of 30 trading stations on the Lower Niger. The establishment of these firms was admittedly a political move which coincided with the extension of French influence from Senegal into the interior. Nearly at the same time a young Englishman, George Goldie-Taubman, afterwards better known as Sir George Goldie (*q.v.*), having some private interests on the Niger, conceived the idea of amalgamating all local British interests and creating a British province on the Niger. To effect this end the United African Company was formed in 1879 and trade was pushed upon the river with an energy which convinced the French firms of the futility of their less united efforts. They yielded the field and allowed themselves to be bought out by the United African Company in 1884. At the Berlin Conference held in 1884-85 the British representative was able to state that Great Britain alone possessed trading interests on the Lower Niger, and in June 1885 a British protectorate was notified over the coast lands known as the Oil rivers. Germany had in the meantime established itself in Cameroons, and the new British protectorate extended along the Gulf of Guinea from the British colony of Lagos on the west to the new German colony on the east, where the Rio del Rey marked the frontier. In the following year, 1886, the United African Company received a royal charter under the title of the Royal Niger Company. The territories which were placed by the charter under the control of the company were those immediately bordering the Lower Niger in its course from the confluence at Lokoja to the sea. On the coast they extended from the Forcados to the Nun mouth of the river. Beyond the confluence European trade had not at that time penetrated to the interior.

The interior was held by powerful Mohammedan rulers who had imposed a military domination upon the indigenous races and were not prepared to open their territories to European intercourse. To secure British political influence, and to preserve a possible field for future development, the Niger Company had negotiated treaties with some of the most important of these rulers, and the nominal extension of the company's territories was carried over the whole sphere of influence thus secured. The movements of Germany from the south-east, and of France from the west and north, were thus held in check, and by securing international agreements the mutual limits of the three European Powers concerned were definitely fixed. The principal treaties relating to the German frontiers were negotiated in 1886 and 1893; the Anglo-French treaties were more numerous; those of 1890 and 1898, which laid down the main lines of division between French and British possessions on the northern and western frontiers of Nigeria, having been supplemented by many lesser rectifications of frontier. It was not until 1909 that the whole of the frontier between Nigeria and the French and German possessions had been definitely demarcated. Thus, mainly by the action of the Royal Niger Company, and with the employment of a force of 500 Hausa trained under European officers, a territory of vast extent, into which the chartered company itself was not able to carry either administrative or trading operations, was secured for Great Britain.

The Protectorate.—Owing to pressure of foreign nations on the company's frontiers, a situation had arisen which the resources of a private company were inadequate to meet. In 1897 relations with France on the western border became so strained that Mr. Chamberlain, who was then secretary of state for the colonies, thought it necessary to raise a local force, afterwards known as the West African Frontier Force, for the special defence of the frontiers of the West African dependencies. In these circumstances it was arranged that in consideration of compensation for private rights the company should surrender its charter and transfer all political rights in the territories to the Crown. The transfer took place on Jan. 1, 1900, from which date the company, which dropped the name of "royal," became a purely trading corporation. The southern portion of the territories was amalgamated with the Niger Coast protectorate, the whole district taking the name of the Protectorate of Southern Nigeria,

while the northern portion, extending from a line drawn slightly above 7° N. to the frontier of the French possessions on the north and including the confluence of the Niger and the Benue at Lokoja, was proclaimed a protectorate under the name of Northern Nigeria.

The company, during its tenure of administrative power under the charter, had organized its territories south of the confluence into trading districts, over each of which there was placed a European agent. The executive powers in Africa were entrusted to an agent-general with 3 provincial and 12 district superintendents. There was a small judicial staff directed by a chief justice, and there was a native constabulary of about 1,000 men, trained and drilled by white officers. The company kept also upon the river a fleet of about 30 steamers. The entire direction of the proceedings of the company was, however, in the hands of the council in London, and the administrative control of the territories was practically from first to last vested in the person of Sir George Goldie. The local work of the representatives of the company was mainly commercial.

Southern Nigeria, 1885-1906.—While the development of the Royal Niger Company's territories was proceeding in the manner described, the regions under direct British control were also being opened up and law and order introduced. In 1893, when the title Oil Rivers Protectorate was changed to that of Niger Coast Protectorate, a regular administration was established (subject to the Foreign Office in London) under Sir Claude Macdonald, who was succeeded as commissioner and consul-general in 1896 by Sir Ralph Moor (1896-1904). Under these officials peace was gradually established between various tribes, trade routes opened, and progress made in civilization. The work was one of extreme difficulty, largely because there was no central native authority with which to deal. Small military expeditions had constantly to be employed to break up slave-raiding gangs or reduce to order tribes which blocked trade routes or made war on other tribes living peaceably under British protection. The most serious military operations were against the Beni, a peaceful mission to the king of Benin having been massacred in the bush in Jan. 1897. The operations were completely successful and the Benin country was added to the protectorate (*see* BENIN). The administration improved the condition of the natives without undue interference with customary law. The submission of the Aros to the Government in 1902 brought to an end the system of tribal warfare for the purpose of making slaves, while a proclamation of 1901 prohibited the buying, pawning, or selling of slaves. Trade steadily developed, and owing to the large sums paid as duty on imported spirits the revenue of the protectorate was sufficient to cover the expenditure.

Northern Nigeria.—In Northern Nigeria at the time of the transfer (1900) British authority had still to be established. The man selected for the post of first high commissioner was Colonel (Lord) Lugard, who had conducted one of the Royal Niger company's most successful expeditions into the western portion of the interior and had already been employed by the British Government to raise and organize the West African Frontier Force.

On Jan. 1, 1900, the Union Jack was hoisted at Lokoja, and the formation of a local administration was entered upon. The headquarters of the West African Frontier Force had been at Jebba, not far from the point at which Mungo Park had lost his life upon the river. Neither Jebba nor Lokoja was considered suitable for the permanent capital of the protectorate and survey parties were sent out to find a more suitable site, with strict orders to avoid conflict with the nominally friendly natives. This was selected on a branch of the Kaduna river in the south-western corner of the province of Zaria, at a place of which the native name of Zung'uru was retained. The ruler of Zaria, while professing friendliness, was, however, unable or unwilling to restrain the rulers of Kontagora and Nupe from aggression. These two potentates raided for slaves to the borders of the rivers and openly threatened the British position on the Niger. The Ashanti War of 1900 claimed the despatch of a strong detachment of the West African Frontier Force, and it was not until the return of the troops in Feb. 1901 that Nupe and

Kontagora could be effectively dealt with. In that year both provinces were subdued, their emirs deposed, and letters of appointment given to new emirs, who undertook to rule in accordance with the requirements of humanity, to abolish slave-raiding and slave dealing, and to acknowledge the sovereignty of Great Britain. Illorin and Borgu with a portion of Kabba were already under British rule. The rulers of other neighbouring provinces offered their allegiance, and by the end of the year 1901 nine provinces, Illorin, Kabba, Middle Niger, Lower Benue, Upper Benue, Nupe, Kontagora, Borgu and Zaria had accepted the British occupation. An initial system of administration was organized and British residents were appointed to each province. Seventeen legislative proclamations were enacted in the first year dealing with the immediate necessities of the position and providing for the establishment of a supreme and provincial court of justice, for the legalization of native courts of justice, and for regulating questions of slavery, importation of liquor and firearms, land titles, etc. In the autumn of 1901 the emir of Yola (the extreme eastern district in the territories bordering upon the Benue) was, in consequence of the aggressions upon a trading station established by the Niger Company, dealt with in the same manner as the emirs of Nupe and Kontagora, and a new emir was appointed. In 1902 Bauchi and Bornu were brought under British rule. Military stations were established in each and both were included in the system of British administration. Later in the same year an act of treachery culminating in the murder of a British resident, Captain Moloney, in the province of Nassarawa, led to the military subjugation of that province. By the end of the year 1902 British administration had been extended to the whole of the provinces in the south, east, and west of the protectorate. The important Mohammedan states of Sokoto, Gando, Kano, and Katsena remained independent. These states were regarded as the stronghold of Fula supremacy. The emir of Sokoto held the position of religious as well as political head of all the lesser states of Northern Nigeria, and in response to friendly overtures on the part of the British administration had declared that between Sokoto and Great Britain there could be nothing but war. Katsena was the centre of local learning, while Kano was at once the commercial and the military centre of power. By the end of 1902 it had become evident that a trial of strength between the Mohammedan powers and the new British administration was inevitable. The Mohammedan rulers were themselves of comparatively recent date. In fighting them there was no question of fighting the whole country. On the contrary it was presumed with justice that their overthrow would be hailed with satisfaction by many of the subject peoples. Every attempt was made to settle the question at issue by conciliatory methods, but, these having failed, a campaign against Kano and Sokoto was entered upon in Jan. 1903. It was entirely successful. The capital of Kano, a walled and fortified town of great extent and formidable strength, fell to a British assault in Feb. 1903. Sokoto submitted after a battle which took place on May 17. The sultan fled, and on May 21 a new sultan, chosen by the council of elders, was installed by the British high commissioner, after he had publicly accepted the conditions imposed by the British Government, namely, that all rights of conquest acquired by the Fulani throughout Northern Nigeria passed to Great Britain, that for the future every sultan and emir and principal officer of state should be appointed by Great Britain, that the emirs and chiefs so appointed should obey the laws of the British Government, that they should no longer buy and sell slaves, nor enslave people, that they should import no firearms, except flintlocks, that they should enforce no sentences in their courts of law which were contrary to humanity, and that the British Government should in future hold rights in land and taxation. When these conditions were accepted by the Fulani chiefs the supremacy of Great Britain was established over the entire country. Katsena and Gando followed the example set for them by Kano and Sokoto. After the conquest of the Hausa states in 1902-3 the King's writ ran—with the exception of a few districts inhabited by primitive savages—through the whole area known as Northern Nigeria.

THE AMALGAMATION OF NIGERIA

Union of Lagos and Southern Nigeria.—In 1904 it was decided to unite the two Nigerias and Lagos under one government, and as a first step in that direction Sir Walter (then Mr.) Egerton was appointed both governor of Lagos and high commissioner of Southern Nigeria. This was followed in Feb. 1906 by the amalgamation of these two administrations under the style of "the Colony and Protectorate of Southern Nigeria," with headquarters at Lagos town. The former colony and protectorate of Lagos (*q.v.*) became the western or Lagos province of the new administration. In the year of amalgamation the revenue reached a record figure, the amount collected being £1,088,000, to which Lagos province contributed £424,000. Over 80% of the revenue was derived from customs. In the same year the expenditure from revenue was £1,056,000.

Northern Nigeria Railway.—Northern Nigeria continued to be a separate protectorate, and in 1907 Sir Frederick Lugard was succeeded as high commissioner by Sir Percy Girouard. In August of that year the British Government, on administrative, strategic, and commercial grounds decided on a railway to give the cities of Zaria and Kano direct communication with the perennially navigable waters of the Lower Niger. In view of the approaching unification of Southern and Northern Nigeria, the money needed, about £1,250,000, was raised as a loan by Southern Nigeria. The route chosen for the line was that advocated by Sir Frederick Lugard. This important work, essential for the welfare of the northern territories, was begun under the superintendence of Sir Percy, the builder of the Wadi Halfa-Khartoum railway. At the same time the Lagos railway was extended to join the Kano line near Zungeru, the Niger being bridged at Jebba.

Land Tenure.—Sir Percy Girouard gave much attention to the land tenure, probably the most important of administrative questions in West Africa. He adopted the land policy of Sir Frederick Lugard and recommended "a declaration in favour of the nationalization of the lands of the protectorate." This was in accord with native laws—that the land is the property of the people, held in trust for them by their chiefs, who have not the power of alienation. In 1909 he was succeeded as Governor (the title High Commissioner having been changed) by Sir H. H. J. Bell; and meanwhile the secretary for the colonies had appointed a strong committee, which, after hearing much evidence, issued a report in April 1910 in substantial agreement with his recommendations. This policy was adopted by the Colonial Office and the natives of Nigeria were secured in the possession of their land—the Government imposing land taxes, which are the equivalent of rent. The exclusion of the European land speculator and denial of the right to buy and sell land and of freehold tenure was held by all the authorities to be essential for the moral and material welfare of the inhabitants of a land where the duty of the white man is mainly that of administration and his material advantages lie in trade.

Amalgamation of Northern Nigeria.—The constitution of Southern Nigeria (1906) left the protectorate still divided into two very different, and, for political purposes, distinct dependencies of the Crown. Southern Nigeria, with an area of about 76,000 sq.m., stretched inland from the Guinea coast through a tropical belt of generally dense forest land to a line irregularly corresponding with the latitude of 7°10' N. Northern Nigeria, with an area of 255,700 sq.m., composed largely of open prairie, hill country, and dry desert plains, extended from the latitude of 7°10' to the frontiers of the French and Zinder territory on the north, to French Dahomey on the west, and to the German Cameroons on the east. The population of Southern Nigeria was about 8,000,000 and the population of Northern Nigeria, with more than three times the area, was about 9,000,000. In both divisions primitive and very backward races had been overrun and influenced by civilizations of a higher type. In the south the new civilization had been European and Christian; in the north, Arab and Mohammedan.

The interdependence of these two regions was obvious and their amalgamation had long been urged upon the Imperial Government. It was not, however, until 1911 that the secretary for

the colonies, Mr. L. V. Harcourt, determined to adopt the policy. Sir F. (Lord) Lugard, who had been the first high commissioner for Northern Nigeria, was asked to initiate and carry out a scheme of amalgamation, being in 1912 appointed governor at the same time of both Southern and Northern Nigeria. The preliminary work was completed in about 18 months, and on Jan. 1, 1914, the governments of Southern and Northern Nigeria were formally amalgamated, Sir Frederick Lugard receiving the personal title of governor-general. The geographical divisions of north and south were maintained. Two lieutenant-governors were appointed, one for the northern and one for the southern province. An administrator was appointed to the colony, the executive council of which became the executive council of the protectorate, while the jurisdiction of the legislative council was confined to the narrow limits of the colony's 1,400 sq.m.

At the time of amalgamation Northern Nigeria was divided into 12 provinces, the native communities being for the most part each under its native ruler, the five principal native states being known as first-class emirates, while each independent chieftainship, however small, retained its treasured liberty, and this system of government was maintained. The southern provinces at that period consisted of three divisions under provincial commissioners. They were the territories east of the Niger, west of the Niger, and the hinterland of Lagos. The native races in the hinterland of Lagos and to the east of the Niger were in a much less advanced state of tribal organization than were the tribes in the north and scarcely fitted for any form of enlightened self-rule. Fetish worship, cannibalism, and barbarous practices were rife. On the west of the Niger, however, three native states, Yoruba, Egbe, and Benin, were strongly organized. They were induced to renounce the exceptional position they enjoyed, under treaties made with Great Britain, and to accept conditions similar to those of the first-class emirates of the north. The introduction of the new system was accompanied by some difficulty, and in 1918 an easily suppressed rising in Egbeland gave momentary uneasiness. Indirect rule has now been fully accepted in both Egbeland and Yorubaland and the report of 1924 stated that it was working admirably in Benin. The way for the extension of such indirect rule as might be found possible was prepared by the division of Southern Nigeria into nine provinces (later increased), each under a British resident, as in the north.

The World War.—The outbreak of the World War within seven months of amalgamation postponed the consolidation of the new system. Patriotic sentiment in the protectorate ran high. Every department was depleted by volunteers for active service, and it was with difficulty that the administrative machine was held together with the remnant of overworked staff retained. For four years, the first thought of every Englishman in Nigeria was given to the war. And not of the Englishmen only. The War served at once to test and to exemplify the solid results of British rule. Throughout the War period the great native chiefs of the north were constant and unflinching in their loyalty.

The native troops of the West African Frontier Force did gallant service, both in the arduous campaign carried out under the leadership of Generals Dobell and Cunliffe in the Cameroons, and in what was to them foreign service in East Africa. The Cameroons campaign which opened in August and September 1914, with reverses all along the British line, at Mora (Aug. 25) and Garua (Aug. 29) in the north, and at Nsanakang (Sept. 6) in the south, lasted until Feb. 1916. It was a severe test for the troops engaged. The fighting was heavy, but they stood it well. Early in 1915 the campaign, in which French troops took an active part, was reorganized. British forces in the north were placed under the command of General Cunliffe, and the final taking of Garua and the storming of Banyo Hill under his leadership on Nov. 6, 1915, in face of a hail of dynamite bombs, was a feat of which any regiment might be proud. The conquered territory was divided between France and Great Britain, to be administered under mandate according to the provisions of the Treaty of Versailles. The portion taken by Great Britain was 31,000 sq.m., with an estimated population of 600,000 (*see CAMEROONS*).

Reforms.—While the War by arresting material development also delayed the application of schemes for the moral welfare of the native population, some progress was made. The judicial and legal systems of the two protectorates were, on amalgamation, combined. One chief justice for the whole of Nigeria and four puisne judges were appointed, and each lieutenant-governor was provided with a legal adviser. The reorganization of the two systems and the revision of the laws of the two protectorates, was a long and heavy job. The first reforms were initiated in 1914. Notwithstanding the difficulties of the moment, an education ordinance was promulgated in 1916 having for its object the reform and co-ordination of the systems of the north and south. It set a definite standard, of which the principal aim was to substitute self-discipline and the formation of character for set examinations in literary subjects, and generally to fit local education to local needs. A forestry ordinance of the same year (1916) dealt with the rapid destruction of the forests, which constitute the principal wealth of the southern provinces.

Not the least achievement of the War period was the elimination of the traffic in foreign "trade spirits," on which the revenue of the southern provinces had largely depended. It was the declared policy of the amalgamated Government to kill this trade by gradually raising the duty. Conditions of war hastened the process. Before the War the revenue from this traffic formed 34.26% of the revenue of Southern Nigeria. By the end of the War it had fallen to a proportion of 1.23. It was held that this result established two important conclusions. First, that the Government of Nigeria could dispense with revenue derived from spirits; secondly, that the produce trade could be conducted successfully without them. As from Feb. 1, 1919, the importation of trade spirits was formally prohibited in all the West African colonies and protectorates.

Constitutional Changes.—Sir F. (later Lord) Lugard retired at the end of the War, and Sir Hugh Clifford succeeded him as governor of Nigeria in July 1919. It was an era of prosperity, and at the end of Clifford's term of governorship great economic progress had been made. Sir Hugh's tenure of office was also notable for two modifications in the system of administration. The first was the extension and reorganization of the central secretariat, a step which in practice tended to curtail the responsibility and initiative of the lieutenant-governors and residents of provinces. The second was the abolition of an advisory Nigerian council established under the amalgamation scheme, and the restoration of the jurisdiction of the legislative council for the colony over the whole of the southern provinces. In the new and enlarged council the elective principle was introduced. The introduction of this elective principle, of which experience in the West Indies has not been altogether encouraging, was new to West Africa, though it has since been applied to Sierra Leone and the Gold Coast. The new council retains an official majority, but includes three elected unofficial members representing the municipal area of Lagos, and one elected unofficial member representing the municipal area of Calabar. The unofficial element also includes members chosen by the three Chambers of Commerce (Lagos, Port Harcourt, and Kano) and the Chamber of Mines, two members representing respectively the banking and shipping interests, and eight the otherwise unrepresented African population of the colony and the southern provinces. The first elections for this council were held in Sept. 1923, and the council was inaugurated by the governor on Oct. 1, 1923. The governor retains the power to legislate for the northern provinces, but the council may discuss affairs of interest to any part of Nigeria. In Sept. 1925 Sir Hugh Clifford was succeeded as governor by Sir Graeme Thomson.

Improvement of Communications.—During his first year of office Sir Graeme made extensive tours, in one of which he traversed the protectorate from Lagos to Lake Chad, the whole distance being covered for the first time by motor; and in Feb. and March, 1926, Mr. W. G. A. Ormsby-Gore, the under-secretary of state, visited Nigeria. Later in the year proposals for the improvement of communications were submitted by the governor and approved in general by the secretary of state. In his address to the legislative council on Feb. 1, 1927, Sir Graeme outlined a

large programme of accelerated road and railway construction. In the next five years the Nigerian Government proposed to increase the 2,970m. of then existing roads by 200m. per annum, and to add to the 1,597m. of railways then open, new branch lines (to feed the main trunk lines) at the rate of 150m. a year.

The necessity for a big improvement in the transport facilities was emphasized by the condition of the cotton industry. In the years 1906–1926 the value of the external trade of Nigeria rose from 5 to 34 millions sterling. More than half of the exports (of the total value of £16,888,361 in 1926) are palm oil and kernels, but among other industries cotton growing, introduced by the British Cotton Growing Association in 1902, is notable, as affording a prospect of mutual benefit to the Africans of the protectorate and to Britain. It is only in recent years, however, that the production of lint for export has been replaced largely by the growing of the long staple American cotton. In the season 1924–25 the amount of American cotton exported was 28,100 bales, and in 1925–26 it rose to 38,350 bales. When in this hopeful stage of development the industry was threatened with disaster by the fall of the world-price of raw cotton in 1920.

To meet the danger the Government carried cotton on the railways at nominal rates, and, in response to Sir Graeme's appeal, the British Cotton Growing Association reduced the ginning charges and Messrs. Elder Dempster their sea-freights. Six months later he was able to announce the success of these measures to a Manchester audience. "A practicably established but growing industry," he said on Sept. 3, had been saved "from a very serious set-back." At the same time, in view of the relative failure of the American cotton when grown in mixture with other crops (as is customary among the African farmers), the Agricultural Department of Nigeria is trying to produce a strain of native cotton with the long fibre required by the Lancashire cotton spinners. If such strains can be produced in sufficient quantities, it is believed that the area under cotton will be largely extended in the near future.

(F. L. L.; W. B. W.)

NIGHTHAWK, an insect-hunting bird closely related to the goatsuckers of the Old World, and less closely to the swifts and humming birds. The nighthawk (*Chordeiles virginianus*) belongs to the family *Caprimulgidae*, goatsuckers, so called from the fancy that they sucked the milk of goats. The wide skull, soft plumage, noiseless flight and nocturnal vision connect these birds with the owls. The nighthawk wanders in migration from the Arctic ocean to southern South America and breeds in eastern North America from Florida to Labrador. The eggs are laid on the ground or on the flat roof of a building. The Texan nighthawk (*Ch. acutipennis texensis*) has rusty-brown spots on the flight feathers.

NIGHTINGALE, FLORENCE (1820–1910), hospital reformer, younger daughter of William Edward Nightingale, of Embury Park, Hampshire, and Lea Hurst, Derbyshire, was born at Florence on May 12, 1820, and named after that city, but her childhood was spent in England, mainly in the country at one of her father's houses, but with periodical visits to London. Sidney Herbert was a neighbour of the Nightingales in Hampshire, and both he and his wife were Florence's friends. She received

a good classical and mathematical education at home under her father's guidance. She began to visit the hospitals in 1844, as she was not content merely to lead the ordinary social life of a girl of her class. In the winter of 1849-50 she made a tour in Egypt with friends, travelling by way of Paris. On the journey she met two sisters of St. Vincent de Paul, who gave her introductions to their order in Alexandria, where she visited their schools and hospital. From the sisters she learned the importance of formal discipline in hospital nursing. She then visited the Institute of Protestant Deaconesses at Kaiserswerth, returning the next year, when she remained for four months to study the organization, and to undergo a regular course of training as a nurse. She then studied the London and Edinburgh hospitals, and in 1853 was in Paris, studying nursing organization there. On her return to England she became (Aug. 1853) superintendent of the Hospital for Invalid Gentlewomen in Chandos street, London, which she moved to Harley street.

In the year 1854 England was stirred profoundly by the report of the sufferings of the sick and wounded in the Crimea. There was an utter absence of the commonest preparations to carry out the first and simplest demands in a place set apart to receive the sick and wounded of a large army. The condition of the large barrack-hospital at Scutari was abominable. A royal commission of enquiry was appointed, a patriotic fund opened, and money flowed in fast. To Florence Nightingale this proved the opportunity for which she had systematically prepared herself. She wrote to her friend Sidney Herbert, secretary at war, and offered her services. Her letter crossed with one from him inviting her to proceed to the Crimea. "My question simply is," he wrote, "would you listen to the request to go out and supervise the whole thing? You would, of course, have plenary authority over all the nurses, and I think I could secure for you the fullest assistance and co-operation from the medical staff, and you would also have an unlimited power of drawing on the Government for whatever you think requisite for the success of your mission."

She set out on Oct. 21 with a staff of 38 nurses. They reached Scutari on Nov. 4 in time to receive the Balaklava wounded. A day or two later these were joined by 600 from Inkerman. The story of Florence Nightingale's labours in the huge insanitary barrack-hospital at Scutari became a legend in her lifetime, a legend diffused over the English-speaking world by Longfellow's verses on "Filomena." She gave herself, body and soul, to the work. She would stand for 20 hours at a stretch to see the wounded accommodated. She regularly took her place in the operation-room, to hearten the sufferers by her presence and sympathy, and at night she would make her solitary round of the wards, lamp in hand, stopping here and there to speak a kindly word to some patient. Soon she had 10,000 men under her charge, and the general superintendence of all the hospitals on the Bosphorus. But the actual superintendence of the hospitals and of the nursing was only part, perhaps only the smaller part, of the work. She wrestled daily and successfully with the military authorities, especially with the commissariat, who naturally regarded her as a dangerous innovator, and indeed thwarted her efforts to break through the mazes of the red-tape methods of administration. In the end her firmness, and, at need, her anger won. The death-rate in the hospitals was 42% in Feb. 1855; in June it was 2%. She had secured by superhuman effort and the force of a dominating personality a measure of sanitation and decent conditions. Even her energy would hardly have triumphed but for the backing she received from Sidney Herbert. Things were going well enough in the summer to allow her to leave Scutari to visit the hospitals at Balaklava. There she caught Crimean fever and herself lay dangerously ill in hospital for 12 days. She refused to leave her post, and remained alternately at Balaklava and Scutari till Turkey was evacuated by the British in July 1856. A man-of-war was ordered to bring her home and London prepared to give her a triumphant reception; but she returned quietly in a French ship, crossed to England, and escaped to her country home before the news of her return could leak out. She visited Queen Victoria at Balmoral in September, and laid before the queen and her husband a plan of the urgent reforms

needed in the military hospitals. The queen's comment on the visitor was: "Such a head! I wish we had her at the War Office."

The experiences of the terrible months in the Crimea permanently affected Florence Nightingale's health, but the quiet life she afterwards led was a busy one. Blue Books and statistics were her daily food; she was always ready to confute the War Office from their own records. With the £50,000 raised in recognition of her services she founded the Nightingale Home for training nurses at St. Thomas's hospital. She watched over the growth of the new institution and each year addressed the nurses. The example of St. Thomas's was followed by others. Florence Nightingale was, indeed, the effective founder of the nursing system in England. She also turned her attention to the question of army sanitary reform and army hospitals, and to the work of the Army Medical College at Chatham. She wrote a candid official report on the working of the army medical department in the Crimea, and in 1858 printed her *Notes on Matters affecting the Health, Efficiency and Hospital Administration of the British Army*. The 800 pages of these notes formed the basis of the Royal Commission to enquire into the health of the army, and are a classic in the literature on army medicine.

If Florence Nightingale lived a life of the strictest retirement she was consulted constantly by the authorities, and expressed her views with great clearness and vigour. The foundation of the hospital schools of nursing in London was followed, at her suggestion, by the formation of a school at Liverpool infirmary (1862). She helped to establish various institutions for nursing, from the East London Nursing society in 1868 to the Queen's Jubilee Nursing institute in 1890. She would have liked to have gone out to India during the Mutiny. She was not invited to go, but she took the deepest interest in the progress of sanitation and of health measures in India, and was constantly in correspondence with the secretary of State for India, and with high officials in India up to 1872.

In her later years, from 1872, when, as she says, she "went out of office," she made a close study of Plato, under the direction of her friend Benjamin Jowett, and of the Christian mystics. She still maintained an enormous correspondence with the heads of the nursing profession and with members of the rank and file. She sought to promote rural hygiene, and was indefatigable in demanding health missionaries for Indian villages. Generally she was a prisoner in her room, where she received favoured visitors from time to time, but she never went out except occasionally for a drive in the park in the early morning. She was 87 when the Order of Merit was brought to her in 1907. Three years later she died in her house at South street on Aug. 13, 1910, and was buried at East Wellow, Hampshire, on Aug. 20.

See Sir E. Cook, *Life of Florence Nightingale* (2 vols., 1913); M. A. Nutting and L. L. Dock, *History of Nursing* (New York, 1907), which contains a bibliography of Miss Nightingale's writings; and a sketch by Lytton Strachey in *Eminent Victorians* (1918).

NIGHTINGALE, the bird celebrated beyond all others by European writers for the vocal powers which, contrary to usual belief, it exercises at all hours of the day and night during some weeks after its return from its winter-quarters in the south. The song itself is indescribable, though several attempts have been made to express in syllables the sound of its many notes. The cock alone sings (see SONG). In great contrast to the nightingale's voice is the inconspicuous colouration of its plumage, which is alike in both sexes, and is of a reddish-brown above and dull greyish-white beneath, the breast being rather darker and the rufous tail showing the only bright tint.

The range of the European nightingale, *Luscinia megarhyncha*, is peculiar. In Great Britain it is abundant in suitable localities to the south-east of a line stretching from the valley of the Exe, in Devonshire, to York, but it does not visit Ireland, Wales or Scotland. On the continent of Europe it does not occur north of a line stretching irregularly from Copenhagen to the northern Urals, and it is absent in Brittany; over south Europe otherwise it is abundant. It reaches Persia, and is a winter visitor to Arabia, Nubia, Abyssinia, Algeria and as far south as the Gold Coast. The larger eastern *L. philomela*, is russet-brown in both

sexes, and is a native of eastern Europe. *L. hafizi* of Persia, is probably the Perso-Arabic bulbul of poets.

The nightingale reaches its English home about the middle of April, the males (as is usual among migratory birds) arriving some days before the females. The nest is of a rather uncommon kind being placed on or near the ground, the outworks consisting chiefly of a great number of dead leaves ingeniously applied together so that the plane of each is vertical. In the midst of the mass is a deep cup-like hollow, neatly lined with fibrous roots, but the whole is so loosely constructed, and depends for lateral support so much on the stems of the plants, among which it is built, that a slight touch disturbs its arrangement. Herein from four to six eggs of a deep olive colour are laid, and the young hatched. The nestling plumage of the nightingale differs from that of the adult, the feathers above being tipped with a buff spot, just as in the young of the redbreast, hedge-sparrow and redstart. Towards the end of summer the nightingale disappears to its African winter haunts.

The name nightingale has been applied to several other birds. The so-called "Virginian nightingale" is a species of grosbeak (*q.v.*); the "Pekin nightingale" or "Japanese nightingale" is a small babbler (*Liothrix luteus*) of the Himalayas and China.

NIGHTJAR or GOATSUCKER (*Caprimulgus europaeus*, Linn.), a bird erroneously believed since very ancient days to have the habit implied by its second name. It is characterized by its flat head, wide mouth fringed with bristles, large eyes, soft plumage and consequently noiseless flight. It arrives in Europe from Africa late in the spring, returning in the early autumn. Its food consists of insects, chiefly moths and cockchafers, which it catches on the wing at night. When resting on a bough the nightjar sits along its length. In this position the cock bird utters his curious burring note. The eggs are laid on the ground and number two; the young are clad in dark-spotted

FROM KOEHLER, "MEDICINAL PFLANZEN"

DEADLY NIGHTSHADE OR DWALE (*ATROPA BELLADONNA*). SHOWING BRANCH WITH FLOWERS AND FRUIT

down, rendering them, like their parents, exceedingly difficult to see when crouching on the ground.

A second species, *A. ruficollis*, occurs in Spain and Portugal and others are found throughout the Old World. In America their place is taken by the allied genus, *Antristomus*, one member of which, *A. vociferus*, is the whip-poor-will (*q.v.*). The nighthawk (*q.v.*) is another common American species, with a voice quite different from that of the whip-poor-will.

The family *Caprimulgidae* is almost cosmopolitan, but is not represented in New Zealand and Polynesia.

NIGHTSHADE, a general term for plants of the botanical genus *Solanum* (family Solanaceae). The species to which the name of nightshade is commonly given in England and North America is *Solanum Dulcamara* which is called also bittersweet or woody nightshade. It is a common plant in damp hedgebanks and thickets, scrambling over underwood and hedges. It has slender slightly woody stems, with alternate lanceolate leaves

WOODY NIGHTSHADE OR BITTERSWEET (*SOLANUM DULCAMARA*)

more or less heart-shaped and auriculate at the base. The flowers are arranged in drooping clusters and resemble those of the potato in shape, although much smaller. The flower clusters spring from the stems at the side of, or opposite to, the insertion of a leaf. The corolla is rotate, of a lilac-blue colour with a green spot at the base of each segment, or sometimes white, and bears the yellow sessile anthers united at their margins so as to form a cone in the centre of the flower. The flowers are succeeded by ovate scarlet berries, $\frac{1}{2}$ in. long, which in large doses appear to be poisonous or, to say the least, dangerous to children, cases of poisoning by them having occurred. The plant derives its names of "bittersweet" and *Dulcamara* from the fact that its taste is at first bitter and then sweet. It is a native of Europe, North Africa and temperate Asia, and is widely naturalized.

The black nightshade, *S. nigrum*, differs from *S. Dulcamara* in having white flowers in small umbels and globose black berries. It is a common and well high cosmopolitan weed in gardens and waste places, growing about 12 or 18 in. high, and has ovate, entire or sinuate or toothed leaves. The berries have been known to produce poisonous effects when eaten by children, and owe their properties to the presence of solanine. In Réunion and Mauritius the leaves are eaten like spinach. (*See SOLANUM.*)

Deadly nightshade, dwale or belladonna (*Atropa belladonna*) is a tall bushy herb of the same plant family. It grows to a height of 4 or 5 ft., having leaves of a dull green colour, with a black, shining, berry fruit, about the size of a cherry, and a large tapering root. The plant is a native of central and south Europe,

extending into Asia, and is found locally in England, chiefly on chalk and limestone, from Westmorland and southwards. The entire plant is highly poisonous, and accidents not infrequently occur through children and unwary persons eating the attractive-looking fruit. Its leaves and roots are largely used in medicine, on which account the plant is cultivated, chiefly in south Germany, Switzerland and France. (See *BELLADONNA*.)

The name nightshade is applied to plants of different genera in other countries.

NIGRA, COSTANTINO, COUNT (1828-1907), Italian diplomatist, was born at Villa Castelnuovo, in the province of Turin, on June 11, 1828. During the war of 1848 he interrupted his studies to serve as a volunteer against Austria, and was wounded at the battle of Rivoli. On the conclusion of peace he entered the Piedmontese foreign office; he accompanied Victor Emmanuel and Cavour to Paris and London in 1855, and in the following year he took part in the conference of Paris by which the Crimean War was brought to an end. After the meeting at Plombières between Cavour and Napoleon III. Nigra was sent to Paris as an agent of Cavour. After the breach with Napoleon he was secretary of state to the prince of Carignano, viceroy of the Neapolitan provinces. When Napoleon recognized the kingdom of Italy in 1861, Nigra returned to France as minister-resident, and for many years played a most important part in political affairs. In 1876 he was transferred to St. Petersburg with the rank of ambassador, in 1882 to London, and in 1885 to Vienna. In 1899 he represented Italy at the first Hague Peace Conference. In 1904 he retired, and he died at Rapallo on July 1, 1907. He was created count in 1882 and senator in 1890.

NIHILISM, the name commonly given to the earliest Russian form of revolutionary anarchism. It originated in the early years of the reign of Alexander II. The term was first used by Turgenev in his celebrated novel, *Fathers and Children*, published in 1862. (See *RUSSIA: History*, and *ANARCHISM*.)

NIIGATA, the chief town of the province of Echigo, Japan. Pop. (1925), 108,941. It occupies an area of rather more than 1 sq.m., and consists of five long parallel streets intersected by cross-streets, which in most cases have canals running down the middle and communicating with the river, so that the internal traffic of the city is mainly carried on by water. Niigata was originally chosen as one of the five open ports—Nagasaki, Kobe, Yokohama, Niigata and Hakodate—but it failed, chiefly owing to a bar which prevents the entry of vessels of any size. The town has been brought within the railway circuit, and the production of petroleum has been developed in the district. There is a large manufacture of lacquer-ware in the town.

NIJAR, a town of south-eastern Spain, in the province of Almería; on the southern slope of the Sierra Alhamilla, and on the small river Artal, which flows into the Mediterranean sea 6 m. S.W. Pop. (1920) 10,809. Lead, iron and manganese are mined in nearby mountains; the fertile plain watered by the Artal yields an abundance of wheat, fruit, olives and esparto grass; fine porcelain and woollen and cotton goods are manufactured there.

NIJMWEGEN, NIMEGUEN, NYMEGEN or NIMWEGEN, a residential town in the province of Gelderland, Holland, on the left bank of the Waal, 24½ m. E. by S. of Tiel by rail. Pop. (1927), 76,069. It has regular steamboat communication with Rotterdam, Cologne and Arnhem, and is very prettily situated on the slopes of five low hills rising from the river-side. It stands up with a boldness quite unusual in a Dutch town, and steps are even necessary to lead to the higher portions of the town. In 1877-1884 the old town walls were demolished, a promenade and gardens taking their place, and since then a new quarter has grown up on the south side with a fine open place called the Emperor Charles's plain. On the east of the town is the beautiful park called the Valkhof, which marks the site of the old palace of the Carolingian emperors. The palace was ruined by the French bombardment of 1794, and only two portions of it remain. These are a part of the choir of the 12th century palace-church, and a sixteen-sided baptistry originally consecrated by Pope Leo III. in 799 and rebuilt in the 12th or 13th century. Close by is the lofty tower of the Belvedere, dating from 1646. The *Groote Kerk*

of St. Stephen forms with its tall square tower one of the most striking features of the town. Originally built about 1272, it dates in its present condition mainly from the 15th and 16th centuries. The interesting Renaissance town-hall was built in 1554 (restored in 1879). There is also an interesting museum of antiquities. Other buildings of note include the old weigh-house and Flesher's hall, probably built in 1612 and restored in 1885. Nijmegen is the seat of a Roman Catholic university. Beer, Prussian blue, leather, tin, pottery, cigars and gold and silver work are the chief industrial products.

NIJNI-NOVGOROD (NIZHNI-NOVGOROD), chief town of province Nijni-Novgorod, R.S.F.S.R., at the confluence of the Oka and Volga rivers in 56° 24' N., 44° E. Pop. (1926) 180,926. The city owes its importance to its position at the junction of the navigable rivers between which, to the west of it, was the flourishing Moscow region, though the development of its trade, at first mainly in furs, was much hampered by Tatar raids, which did not cease until the second half of the 16th century. After the last raid in 1536 it became a dépôt for goods brought from the south-east, and the conquest of Kazan in 1552 and of Astrakhan in 1556 opened free navigation on the Volga. The thick forests of the district provided material for shipbuilding and a yearly "caravan" of boats under military protection began to carry the products of Moscow and the north to the Caspian and to return laden with the products of the south and east.

The Fair.—From remote antiquity Russian merchants were wont to meet in summer with those from the east at different places on the Volga between the mouths of the eastward flowing Oka and the westward flowing Kama, the fair changing its site with the increasing or decreasing power of the nationalities which struggled for the possession of the Middle Volga. Bolgari, Nijni-Novgorod, Kazan and Vasilsursk have been successively the site of the fair since the 10th century. From 1641 its seat was at a monastery 55 m. below Nijni and close to Makaryev; this situation later proved inconvenient, and after the destruction of the shops by fire, the fair was transferred to Nijni in 1817 and has remained there ever since.

The long distances in Russia, the poor network of communications, the seasonal nature of production and river transport, the dependence of the peasant on handicrafts as a supplement to agriculture, the close link between Russia and the Orient, are some of the factors which have tended to preserve the importance of fairs as a medium of exchange and barter. In the more industrialized regions of the south and west, with their better railway facilities and higher level of literacy, fairs are gradually dying out, but in other regions they are still of the greatest importance for home trade. The state grants special customs exemptions to goods destined for the Nijni fair and gives cheaper transport facilities and special credits to traders. Products of the peasant home industries from every region in which they are at all developed are increasingly taking an important place in the fair.

Until the '80s Russian manufacturers depended largely on barter trade in tea from Kiakhta and its price at the fair regulated output. Later the price of raw cotton and madder from Asia at the fair influenced the output of the growing textile industry of the central productive region. The owners of the iron works in the Ural district sent "caravans" of boats laden with iron goods to Nijni, where the purchases of iron made for Asia and Middle Russia determined the amount of credit on which they could depend for the next year's work. Similarly the corn and salt trade of the south and the general trade of Siberia and Turkistan depended on the prices obtaining at the fair.

The fair reached its highest development between 1880 and 1884, when the turnover was 21.5 million pounds. In 1910 the turnover was 15.9 million pounds. During the 1914-1922 war and civil war, the trade of Nijni was interrupted, and when the fair re-opened in 1923, conditions had altogether changed. Private trade, though not entirely suppressed, had been markedly reduced and the various State Trading Departments and local goods exchanges had taken over much of the regulation between supply and demand, formerly largely dependent on the fair. Only 647 firms took part in the 1923 fair and the turnover was small, but

trade has gradually adapted itself to the changed conditions and in 1927 the turnover was 20.3 million pounds, and the number of firms taking part was 2,549.

Sales to Eastern countries at the 1927 fair amounted to 2.3 million pounds and purchases from them to 1.5 million pounds. Trade with the Ural metal region via the Kama, with Siberia and with the corn, salt, wine and naphtha regions of the Caspian has revived. The duration of the fair is fixed for Aug. 1 to Sept. 15. A horse fair is held in June, and one in January on the ice of the river Oka for wooden goods made by the peasants, the river being frozen from November to April.

In addition to its trading activities the town has shipbuilding and repair yards and manufactures machinery, telephones, chemicals, sewn goods, matches, bricks, flour, confectionery and alcoholic drinks. These industries are now supplied with electricity from the Balakhna peat fuel plant opened in 1925-26. A recently established industry is the making of radio sets, in connection with which there is an experimental station. The town has railway links through Vyatka with Perm and Sverdlovsk, and also with Kotlas, which will probably be linked with Murmansk via Soroka at no distant date, with Moscow, and, by a branch line to Arzamas, with the trans-Siberian railway. There is also a short branch to Pavlov. Steam navigation on the Volga began in 1821, and has developed rapidly since 1845. A bi-weekly air service between Moscow and Nijni-Novgorod has been established, with daily services during the period of the fair.

The Town consists of three parts. The upper city is built on three hills on the right bank of the rivers (490 ft.). On one of them is the ancient citadel or Kremlin, first erected as a palisaded fort in the second half of the 14th century, and rebuilt in the early 16th century, with a wall 2,300 yards long, 65 to 95 ft. high and having eleven towers. Within it are the law courts, the former governor's residence, the arsenal, barracks, etc., a museum and the Preobrazhensky and Archangel cathedrals, dating from 1225 and 1222 respectively, but much spoilt by later restorations. Kozma Minin Sukhorukov, a cattle-dealer of the town, who organized the army that saved Moscow from Polish dominion in 1612, is buried in the Preobrazhensky cathedral and a square in the Kremlin contains a monument to Minin and Pozharsky erected in 1826. The view from the Kremlin of the broad Volga with its low-lying and far-spreading left bank is very striking. Near the Kremlin are two monasteries, the Pechersky, built in the first half of the 16th century to replace one founded in 1330 and destroyed by a landslide in 1596, and the Blagovyeshchensk (1370, rebuilt 1647). Five descents lead to the lower town, the Nijni bazaar, built on the alluvial terrace 30 to 35 ft. above the banks of the Oka and Volga.

The fair is held on the flat sandy tongue of land between the rivers, connected with the town by a bridge of boats, 1,500 yards long, which is taken to pieces in winter. The shops of the fair, 4,000 in number, built of stone in regular rows, are surrounded by a canal and cover half a square mile, and there are more than 4,000 other shops outside this inner fair. There are salt, grain and timber wharves and rough goods are landed on an island in the Volga. Tea boxes and temporary shelters for the tea tasters accumulate in the Siberian harbour during fair time. The point of the peninsula is occupied by the storehouses of the steamboat companies, while metal wares and corn are discharged on a long island in the Oka, at the iron harbour, and in the Grebnovskaia harbour. The railway from Moscow has its terminus close to the fair buildings, to the south of which is the Kunavino pleasure suburb. On the fair side are the Alexander Nevsky cathedral (1881) and the "Fair" cathedral (1822). The climate is harsh and continental, average January temperature 10.6° F, July 64° F, extreme readings -46° F and +104° F.

History.—The confluence of the Oka and the Volga, inhabited in the 10th century by Mordvinian tribes, began to be coveted by the Russians as soon as they had occupied the upper Volga, and as early as the 11th century they established a fort, Gorodets, 20 m. above the mouth of the Oka. In 1221, the people of Suzdal, under Yuri Vsevolodovich, prince of Vladimir, erected a fort on the hill now occupied by the Kremlin. Until the beginning of the

14th century Nijni-Novgorod, which grew rapidly as the Russians colonized the banks of the Oka, remained subject to Suzdal; it enjoyed, however, almost complete independence, being ruled by its popular assembly. Until 1390, it elected its own princes. Ill-protected by its palisaded walls, it was plundered in 1377 and 1378 by the Tatars, supported by the Mordvinians.

In 1390 Prince Vasili of Moscow, in alliance with Toktamish, khan of the Golden Horde of the Mongols, took Nijni and established his own governors there; in 1417 it was definitely annexed to Moscow, becoming a stronghold for the further advance of that principality towards the east. It was fortified in 1508-1511, and was able to repel the Tatars in 1513, 1520 and 1536. In 1606-1611 the trading classes took an active part in the expeditions against the revolted serfs. A Nijni cattle-dealer, Sukhorukov, helped to deliver Moscow from the Poles in 1612. In 1667 the city withstood an attack by Stenka Razin. During the 17th century the country became the seat of a vigorous religious agitation, and in its forests the Raskolniks established hundreds of their monasteries and communities, those of the Kerzhnets playing an important part in the history of Russian Nonconformity.

Nijni-Novgorod had at one time two academies, Greek and Slav, and took some part in the literary movement of the end of the 18th century; its theatre also was of some importance in the history of the Russian stage. It has a growing university and a Workers' Scientific institute opened since the 1917 revolution.

NIKĒ, the goddess of victory (Gr. *νίκη*, Lat. *Victoria*). She does not appear personified in Homer. In Hesiod (*Theog.* 384) she is the daughter of the giant Pallas and Styx, and is sent to fight on the side of Zeus against the Titans. Nikē does not appear to have been the object of a separate cult at Athens. She was at first inseparably connected and confounded with Pallas Athena, the dispenser of victory, but gradually separated from her. As an attribute of both Athena and Zeus she is represented as a small figure carried by those divinities in their hand. Athena Nikē was always wingless, Nikē alone winged.

At Rome Victoria was said to have been worshipped ever since Evander's days, being identified with the obscure Vica Potā and other goddesses. Special games were held in her honour in the circus, and generals erected statues of her after a successful campaign. She came to be regarded as the protecting goddess of the senate, and her statue (originally brought from Tarentum and set up by Augustus in memory of the battle of Actium) in the Curia Julia (Dio Cassius li. 22; Suetonius, *Aug.* 100) was the cause of the final combat between Christianity and paganism towards the end of the 4th century. Victoria had altars in camp, a special set of worshippers and colleges, a festival on Nov. 1, temples at Rome and throughout the empire. Representations of Nikē-Victoria in art are very numerous. cf. GREEK ART (fig. 3).

See L. R. Farnell, *Cults of the Greek States*, i. (1896); G. Wissowa, *Religion und Kultus* (2nd ed. 1912) (bibl.); Roscher's *Lexikon*, arts. Nikē, Victoria.

NIKISCH, ARTHUR (1855-1922), Hungarian conductor, was a precocious child, making a public appearance as a pianist at eight years old. He studied at the Vienna Conservatoire from 1866 to 1873, and while there he composed a symphony and other works. In 1877 he began as assistant conductor at the Leipzig opera and two years later became chief conductor. His brilliant success in Leipzig gave him a world-wide reputation. Nikisch was conductor of the symphony orchestra at Boston, U.S.A., from 1889 to 1893; and subsequently, after having been director at the Budapest opera, at the Leipzig Gewandhaus. He died in Leipzig on Jan. 23, 1922.

See F. Pföhl, *Arthur Nikisch* (Hamburg, 1925).

NIKKO, one of the chief religious centres of Japan. The name belongs properly to the district, but is as commonly applied to the principal village, Hachi-ishi, which is 91 m. N. of Tokyo by rail. The chief mountain range is known as Nikko-Zan (Mountains of the Sun's Brightness). A Shinto temple seems to have existed at Nikko from time immemorial, and in 767 its first Buddhist temple was founded by Shodo Sho-nin (the subject of many strange legendary adventures); but the main celebrity of the place is due to the sepulchres and sanctuaries of Iyeyasu and

Iyemitsu, the first and third shoguns of the Tokugawa dynasty. Iyeyasu was buried with amazing pomp in 1617, and Iyemitsu, his grandson, was slain in 1650 while visiting his tomb. From 1644 to 1868 the "abbots" of Nikko were always princes of the imperial blood; thirteen of them are buried within the sacred grounds. The tomb of Iyeyasu lies apart about two hundred steps higher up the hills, in the shadow of tall cryptomerias—a single light-coloured bronze urn or casket standing on a circular base of three steps with a stone table in front on which rest a censer, a lotus-cluster and a stork with a candlestick in its mouth, the whole enclosed by a high stone wall. Somewhat similar are the tomb of Iyemitsu and its surroundings. Hotoké Iwa, the hill on which the tomb stands, is completely covered with trees and there are numerous temples and shrines of minor interest.

NIKOLAYEV, a seaport of the Ukrainian S.S.R., situated a little above the confluence of the Ingul and Bug rivers, at the head of the Bug estuary in 46° 58' N., 31° 58' E. Pop. (1926) 101,182. Vessels have to pass the bar of the Dnieper to reach the Ochakov channel, and dredging has been carried out to a depth of 25 ft., so that vessels of 24 ft. draught can pass without lightening their loads. Two icebreakers are now working so as to keep the estuary of the Dnieper and the channel of the Bug open for navigation from the Black sea to Nikolayev all the year round. There is a government commercial quay and a harbour for coasting vessels. The Varvarovka jetty was damaged during the civil war and is not at present open. A new quay, three quarters of a mile long is under construction (1928). There are floating elevators and a railway grain elevator. The chief imports are cement, iron, steel, machinery and general merchandise, and the exports are grains, oilseeds, sugar, wool, iron-ore, manganese and timber.

In common with other Black sea ports, Nikolayev has suffered from the effects of the civil war and the war of intervention and from the decrease in Black sea trade due partly to change of frontiers and partly to war damage and loss of ships and the cessation of repairs and construction until 1923. The town has ship yards where steamers for the admiralty and for the commercial fleet are built, the construction of armoured ships and torpedo boats dating back to 1870, and being carried out mainly along the bank of the Ingul river. Ochakov and Kimburn are potential forts to protect the double estuary in case of attack. The industrial enterprises of Nikolayev include the manufacture of machinery, ploughs, nails, glass, footwear, macaroni, tobacco and alcoholic drinks. The town is linked by rail with the general railway net to the north, and also has a branch to Kherson.

The remains of the Greek colony *Olbia* have been discovered close to the confluence of the Ingul with the Bug, 10 m. S. of Nikolayev. After the fall of Ochakov, Prince Potemkin established (1789) a wharf on the Ingul which received the name of Nikolayev.

NIKOLAYEVSK: see PUGACHEV.

NIKON [NIKITA MININ] (1605–1681), 6th patriarch of Moscow, Russian reformer and statesman, son of a peasant farmer named Mina, was born on May 7, 1605, in the village of Valmanovo, 90 versts from Nijni-Novgorod. Misery pursued the child from his cradle, and prematurely hardened a character not naturally soft; he ran away from home to save his life from an inhuman stepmother. He took orders, and became a popular preacher in Moscow, then, seeing in the loss of his three little children a providential warning to seek the higher life, he first persuaded his wife to take the veil, and then withdrew himself first to a desolate hermitage on the isle of Anzersky on the White Sea, and finally to the Kozhuzersky monastery, in the diocese of Novgorod, of which he became abbot in 1643. On becoming a monk he took the name of Nikon. In his official capacity he had frequently to visit Moscow, and in 1646 made the acquaintance of the pious and impressionable Tsar Alexius, who fell entirely under his influence. Alexius appointed Nikon archimandrite, or prior, of the wealthy Novospassky monastery at Moscow, and in 1648 metropolitan of Great Novgorod. Finally (Aug. 1, 1652) he was elected patriarch of Moscow. It was only with the utmost difficulty that Nikon could be persuaded to become the arch-

pastor of the Russian Church, and he only yielded after imposing upon the whole assembly a solemn oath of obedience to him in everything concerning the dogmas, canons and observances of the Orthodox Church.

Ecclesiastical reform was already in the air. A number of ecclesiastical dignitaries, known as the party of the protopopes (deans), had accepted the responsibility for the revision of the church service-books inaugurated by the late Patriarch Joasaf, and a few other very trivial rectifications of certain ancient observances. Nikon was bolder and more liberal. He consulted the most learned of the Greek prelates abroad; invited them to a consultation at Moscow; and finally the scholars of Constantinople and Kiev opened the eyes of Nikon to the fact that the Muscovite service-books were heterodox, and that the ikons actually in use had very widely departed from the ancient Constantinopolitan models, being for the most part imitations of later Polish and Frankish (West European) models. He at once (1654) summoned a properly qualified synod of experts to re-examine the service-books revised by the Patriarch Joasaf, and the majority of the synod decided that "the Greeks should be followed rather than our own ancients." A second council, held at Moscow in 1656, sanctioned the revision of the service-books as suggested by the first council, and anathematized the dissentient minority, which included the party of the protopopes and Paul, bishop of Kolomna. Heavily weighted with the fullest oecumenical authority, Nikon's patriarchal staff descended with crushing force upon the heterodox. His scheme of reform included not only service-books and ceremonies but the use of the "newfangled" ikons, for which he ordered a house-to-house search to be made. His soldiers and servants were charged first to gouge out the eyes of these "heretical counterfeits" and then carry them through the town in derision. He also issued a *ukaz* threatening with the severest penalties all who dared to make or use such ikons in future. This ruthlessness goes far to explain the unappeasable hatred with which the "Old Ritualists" and the "Old Believers," as they now began to be called, ever afterwards regarded Nikon and all his works.

From 1652 to 1658, Nikon was not so much the minister as the colleague of the tsar. Both in public documents and in private letters he was permitted to use the sovereign title. Such a free use did he make of his vast power, that some Russian historians have suspected him of the design of establishing "a particular national papacy"; and he himself certainly maintained that the spiritual was superior to the temporal power. He enriched the numerous and splendid monasteries which he built with valuable libraries. His emissaries scoured Muscovy and the Orient for precious Greek and Slavonic mss., both sacred and profane. But his severity raised up a whole host of enemies against him, and by the summer of 1658 they had convinced Alexius that the sovereign patriarch was eclipsing the sovereign tsar. Alexius suddenly grew cold towards his "own familiar friend." Nikon thereupon publicly divested himself of the patriarchal vestments and shut himself up in the Voskresensky monastery (19th of July 1658). In February 1660 a synod was held at Moscow to terminate "the widowhood" of the Muscovite Church, which had now been without a pastor for nearly two years. The synod decided not only that a new patriarch should be appointed, but that Nikon had forfeited both his archiepiscopal rank and his priest's orders. Against the second part of this decision, however, the great ecclesiastical expert Epifany Slavenitsky protested energetically, and ultimately the whole inquiry collapsed, the scrupulous tsar shrinking from the enforcement of the decrees of the synod for fear of committing mortal sin.

For six years longer the Church of Muscovy remained without a patriarch. Every year the question of Nikon's deposition became more complicated and confusing. At last the matter was submitted to an oecumenical council, which opened its sessions on Nov. 18, 1666, in the presence of the tsar. On Dec. 12 the council pronounced Nikon guilty of reviling the tsar and the whole Muscovite Church, of deposing Paul, bishop of Kolomna, contrary to the canons, and of beating and torturing his dependants. His sentence was deprivation of all his sacerdotal functions;

henceforth he was to be known simply as the monk Nikon. The same day he was sent as a prisoner to the Therapontov Byelozersky monastery. Yet the very council which had deposed him confirmed all his reforms and anathematized all who should refuse to accept them. Nikon survived the tsar (with whom something of the old intimacy was resumed in 1671) five years, expiring on Aug. 17, 1681.

NIKOPOLI or **NICOPOLIS** (Bulgarian *Nikopol*), the chief town of a sub-prefecture in the district of Plevna (Pleven), Bulgaria. Pop. (1926) 4,936. Nikopoli is picturesquely situated on the south bank of the Danube, where it receives the Osem. The chief industries are tanning and fishing. As a military post the town has for centuries been important. A ruined castle still dominates the place, and fortifications stretch down to the river.

Nikopoli occupies the site of the ancient Asamus, but by some mediaeval confusion bears the name of Nicopolis ad Istrum, which was founded by Trajan several miles down the river, at the inflow of the Iatrus or Yantra, at the spot still called Nikup. The following are the chief points in the modern history of the place:—capture of the fortress by Sigismund of Hungary in 1392 and 1395; defeat of Sigismund and his hosts in 1396 by Bayezid I.; siege of the town by King Ladislaus I. of Hungary in 1444; defeat of the Turks by Bathori in 1595 and by Michael of Walachia in 1598; capture of the town by Pasvan-oglu in 1797; occupation of the fortress by the Russians under Kamensky in 1810; destruction of the Turkish flotilla by Govarov in 1829; capture and burning of the town by the Russians under Krüdener, June 15, 1877.

NIKŠIĆ (pronounced Nikshich), a romantically situated town of Montenegro, Yugoslavia, in the valley of the Zeta, which forms the main source of communication between north and south Montenegro. Pop. (1921) 3,942. Wheat, maize, rye and potatoes are cultivated, and there are two breweries, cloth and cotton mills in the town, which is an important mart for timber, hides, farm produce and livestock. The chief road, to Podgorica (*q.v.*), is entered by a long viaduct, the gift of Russia, to obviate the flooding which formerly often rendered it impassable. The town, of white houses, is built round a square with four radiating streets, and is dominated by the pale yellow cupola of the Byzantine cathedral, another gift from Russia. Close by stands a royal palace and on one of the heights are the ruins of an old Turkish fortress. About 12 m. S.E. is the famous shrine of Ostrog (see MONTENEGRO).

NILE, the longest river of Africa, and second in length of all the rivers of the globe, draining a vast area in north-east Africa, from the East African lake plateau to the shores of the Mediterranean. Although falling short of the length of the Mississippi-Missouri (4,194 m. according to the estimate of General Tillo), the Nile is at the head of all rivers as regards the length of its basin, which extends through 35° of latitude or 2,450 m. in a direct line, with a waterway of about 4,000 m. The Nile proper, *i.e.*, from the outlet at Victoria Nyanza to the sea, is 3,473 m. long.

The early Egyptians called this river by a name which was probably pronounced Hapy. This survived as a religious designation down to the fall of paganism. The "great river" was also a frequent name for the main stream, and this became the usual name of the Nile in late times as *Ier-o* and continued in use amongst the Copts. In the Bible the Nile is regularly named *Yeôr* (יָאֵר, יְאֵר), from the contemporary Egyptian *Yor*, "river." The origin of the Greek and Roman name *Νεῖλος*, *Niûs*, is quite unknown. *Αἴγυπτος* in the *Odyssey* is the name of the Nile (masc.) as well as of the country (fem.). The Arabs preserved the classical name of the Nile in the proper name En-Nil النيل, or Nil-Misr النيل مصر, the Nile of Misr (Egypt). The same word signifies indigo.

The modern Egyptians commonly call the river El-Bahr, "the sea," a term also applied to the largest rivers, and the inundation

"the Nile," En-Nil; they also call the river Bahr-en-Nil, "the river Nile."

Basin of the River.—The Nile system is a simple one with three principal divisions: (1) the main stream running south to north, and fed by the great lakes of East Central Africa; (2) the equatorial tributary rivers draining the country north-east of the Congo basin; (3) the Abyssinian affluents. The extent of the basin of the Nile is clearly indicated on the map. Its area is estimated at 1,107,227 sq.m., which compares with the 1,425,000 sq.m. area of the Congo basin. The smaller basin of the longer river is due to its narrowness when north of Khartoum. Southward the basin includes the northern part of the plateau between the two "Rift" valleys which traverse that part of Africa, and also that portion of the Albertine (or western) "Rift" valley which lies north of the Mfumbiro mountains. That part of the plateau within the Nile basin is occupied by the Victoria Nyanza and its affluents. These affluents drain a comparatively small part of this plateau, which stretches south to Lake Nyasa. The most remote feeder of the Nile in this direction does not extend farther than 3° 20' S.W. and W.S.W. of Victoria Nyanza, however, the Nile basin reaches 3° 50' S. (264 m. south of the equator) and 29° 15' E., following the crest of the hills which dominate the north-eastern shores of Lake Tanganyika and the eastern shores of Lake Kivu. Turning north-westward from this point the Nile basin crosses the mountainous region of Mfumbiro and includes that of Ruwenzori. Its limit is marked by the western wall of the Albertine Rift valley, in which lie the Albert and Edward lakes. For a considerable distance the water-parting between the Congo and the Nile is close to the Albert Nyanza and to the Nile as it flows from that lake, but not far north of Wadelai (2° 46' N.) the hills recede and the Nile basin expands westward, over the wide area drained by the Bahr-el-Ghazal and its tributaries. In this region there is no well-marked watershed between the Congo and Nile systems, which interlace. Farther north the limit of the basin is marked by the hills of Darfur. Below that point the valley of the Nile extends but a mile or two from the river banks.

The south-eastern limits of the Nile basin extend nearly to the western escarpment of the eastern Rift valley—the dividing plateau being a narrow one. North of the equator a bend is made westward to Mt. Elgon, which on the north-east sends its water towards Lake Rudolf. From Mt. Elgon the Nile watershed is some distance to the west of that lake, while to its north a turn is made again, the watershed including a great part of the Abyssinian highlands. Beyond 15° N. it follows a line generally parallel to the west shore of the Red Sea, except where diverted to the west by the basin of the Khor Baraka.

Sources of the Nile.—The question of the sources of the Nile opens up a time-honoured controversy (see under *Story of Discovery* p. 455). Victoria Nyanza (*q.v.*) is the great reservoir whence issues the Nile on its long journey to the Mediterranean. But if the source of the river be considered to be the most remote headstream (measured by the windings of the stream), the distinction belongs to one of the upper branches of the Kagera. Among the feeders of Victoria Nyanza the Kagera is the most important, both for length of course and volume of water carried, draining the region of greatest rainfall round Lake Victoria.

Three chief branches unite to form the Kagera, and of these the most important for the volume of water carried is said to be the Nyavarongo. (i.) The Nyavarongo is formed by the union of various mountain streams, the Rukarara and the Mhogo being the chief. The Rukarara rises in about 2° 20' S., 29° 20' E., at an elevation of some 7,000 ft., in a picturesque and bracing region immediately east of the Albertine Rift valley. The Nyavarongo first flows north to about 1° 40' S., then turning in a sharp bend east and south, and on again reaching 2° 20' S., unites with the Akanyaru just west of 30° E. (ii.) The Akanyaru, which comes from the south-west, has been sometimes considered the larger stream, but according to Dr. Richard Kandt it carries decidedly less water, while its course is shorter than that of the Nyavarongo. The combined stream takes an easterly and southerly direction, flowing in a swamp valley and joining a little west of 31° E. the third branch of the Kagera, the Ruvuvu, coming from the south.

(iii.) The source of the Ruvuvu is in about $2^{\circ} 55' \text{ S.}$, $29\frac{1}{2}^{\circ} \text{ E.}$, but its most southern tributary, and the most distant stream sending its waters towards the Nile, is the Lavironza. The Lavironza rises in about $3^{\circ} 45' \text{ S.}$, $29^{\circ} 50' \text{ E.}$, and flows north-east, joining the Ruvuvu, which has hitherto had an easterly direction, in about $30^{\circ} 25' \text{ E.}$, $3^{\circ} 10' \text{ S.}$ From this point the Ruvuvu flows east and north to its junction with the Nyavavongo.

From this confluence the combined stream of the Kagera flows north and north-west in a level valley strewn with small lakes until almost 1° S. , when it turns east, and finally empties itself into Victoria Nyanza just north of 1° S. , the mouth forming a small projecting delta. Its lower course is navigable by shallow draught steamers. The total length of the Kagera, reckoning from the source of the Nyavavongo, is some 430 miles. The average volume discharged is estimated, from measurements which have been made to be about 350 cu. metres per second. All the other feeders of Victoria Nyanza are small and often intermittent rivers, the largest being probably the Nzoia, which enters on the north-east from the plateaus south of Mount Elgon.

The Victoria or Somerset Nile.—The ridge of high land which forms the northern shore of Victoria Nyanza is broken at its narrowest part, where the pent-up waters of the lake have forced a passage at the northern end of a beautiful bay named Napoleon Gulf. At this spot, 30 m. north of the equator, at an altitude of 3,704 ft., the Nile issues from the lake between cliffs 200 and more ft. high with a breadth of some 500 yds. The scene is one of much grandeur. The escaping water precipitates itself over a rocky ledge with a clear fall of $16\frac{1}{2}$ ft. The falls, some 300 yds. across, and divided into three channels by two small wooded islands, are named the *Ripon Falls*, after Earl de Grey and Ripon (afterwards 1st marquess of Ripon), president of the Royal Geographical Society in 1859.

The Victoria or Somerset Nile, as this section is called, has at first the character of a mountain stream, racing swiftly through a rocky channel often walled in by cliffs (at times 180 ft. high) and broken by picturesque islands and countless rapids. It receives the waters of several streams, which, rising within a few miles of the Victoria Nyanza, flow north. For 133 m. its course is north-north-west, when, on being joined by the river Kafu (on which Fort Mruli stands), about $1^{\circ} 39' \text{ N.}$, $32^{\circ} 20' \text{ E.}$, it takes the north-east direction of that channel, and it is not till 2° N. that the river again turns westward towards Lake Albert. Seventy miles below the Ripon Falls the Nile enters a marshy lake of irregular outline, running mainly east and west, and known as Kioga (or Choga). The current of the Nile is clearly discernible along the western shore of this lake, which is 3,514 ft. above the sea. Eastwards the lake breaks into several long arms, which receive the waters of other lakes lying on the plain west of Mount Elgon. One of these, named Lake Salisbury, lies in $1^{\circ} 40' \text{ N.}$ and 34° E. ; east of this lake and connected with it is Lake Gedge. Lake Kioga also receives the Mpologoma, a river which rises in the foothills of Elgon and flows east and north, attaining a width of $1\frac{1}{2}$ m.; and from the south (west of the Nile) a broad lacustrine river, the Seziwa. The Kioga lake system, lying north of the ridge which separates it from Lake Victoria, owes its formation in part to the waters pouring down from the Nyanza, and is in the nature of a huge Nile backwater. The lake itself is rarely more than 20 ft. deep; its greatest length is 85 m.; its greatest width 10 m.

Below Mruli, the fall in the bed levels of the Nile, which up to this point has been comparatively gradual, increases considerably. At Karuma, where the western bend to Lake Albert is made, the river falls over a wall-like ledge of rock, 5 ft. high, which extends across its bed. But the great feature of the Victoria Nile is the *Murchison Falls* (named by Sir Samuel Baker, their discoverer, after Sir Roderick Murchison, the geologist), situated in $2^{\circ} 18' \text{ N.}$ and $31^{\circ} 50' \text{ E.}$ At this point the river rages furiously through a rock-bound pass, and, plunging through a cleft less than 18 ft. wide, leaps about 130 ft. into a spray-covered abyss. Downstream from these falls the river flows for some 14 m. between steep forest-covered hills, a wide and noble stream with a current so slow and steady that, at certain seasons, it is only from the scarcely perceptible drifting of the green water-plants called *Pistia*

stratiotes that it can be observed. About 24 m. below the Murchison Falls and 254 m. from Lake Victoria the river enters, through a wide delta, and across a formidable bar, the north-east end of Lake Albert. In its passage from the one lake to the other the Nile falls altogether about 1,400 ft. Taking its name from a fort which once existed there, the delta district is known as Magungo.

From Lake Albert to the Plains.—Issuing from the north-west corner of Lake Albert some 5 m. from the spot where it entered that lake, the Nile, which is now known as the *Bahr-el-Jebel*, or Mountain river, flows in a generally northerly direction. As far as Dufile, 130 m. below Magungo, it has a gentle slope, a deep channel and a current generally slight. It forms a series of lake-like reaches often studded with reedy islands. Immediately below Dufile the Kuku mountains on the west and the Arju range on the east close in upon the river, which, from an average width of 700 yd., narrows to 230 yd. Here the hills cause the stream to make a sharp bend from the north-east to the north-west. Four or five miles lower down the river widens to 400 yd., and a large island divides the stream, the eastern channel carrying the main volume of water.

This island marks the beginning of the *Fola Rapids*. At its southern end the water falls some 20 ft., and then, like a gigantic mill-race rushes through a gorge 330 ft. long and nowhere more than 52 ft. wide, to leap into a deep cavity not more than 40 ft. across. Escaping from this cauldron, the waters thunder on in a succession of rapids, which extend beyond the northern end of the island. In all the Fola Rapids are nearly 2 m. long. For the next 80 m. the Nile, save for the great volume of water, resembles a mountain torrent, its course interrupted by continual rapids. The last of these occurs at Bedden, where the river breaks through a line of low hills running athwart its channel.

Below Bedden various stations are established upon the river. Fort Berkeley, in $4^{\circ} 40' \text{ N.}$ (on the right bank), is the nearest to the rapids. Then follow Rejaf (left bank), Gondokoro (right bank) and Lado (left bank), all within 30 m. of one another. A striking feature of the scenery at Rejaf is a cone-shaped hill, about 370 ft. high, crowned by rocks which have the appearance of the ruins of an ancient castle. At Gondokoro the Nile is clear of the hill country, and enters a vast swamp-like expanse through which it flows with a very low slope and a very tortuous channel.

Between Lake Albert and the swamp region the Bahr-el-Jebel is joined by many streams. The most important of these affluents is the Asua (nearly 200 m. long), which enters the main stream from the east in $3^{\circ} 50' \text{ N.}$ (19 m. N. of Dufile), but has little water in the dry season. The Asua and its subsidiary streams rise on the western versant of the Karamojo plateau and among the mountain ranges which run off from that plateau to the north-west, the most remote head-stream running originally due south.

The Region of Swamps.—The wide valley which the Nile enters at Gondokoro slopes so gradually towards the north that the river falls only some 182 ft. in a stretch of 475 m. Through this valley the river winds in an extremely tortuous course, and its banks are very low in the middle and lower reaches, so that the overflow has caused extensive swamps which are covered by a mass of papyrus and tall reeds, in which are numerous shallow lagoons or "mayyas." The shape of these lagoons is constantly altering, as also is that of the channels connecting them with the river. About 8 m. below Bor, many of the eastern "spills" unite and form a stream of considerable breadth, with a strong current. This stream, which is known to the Dinkas as the Atem, follows a course generally parallel to the Jebel, being bounded eastward by forest land. Opposite Kanisa ($6^{\circ} 46' \text{ N.}$), on the main river, the Atem divides into two channels, marshy land extending at this point a great distance to the east. The western branch, or Awai, rejoins the Jebel near Shambe $7^{\circ} 6' \text{ N.}$ The eastern branch or Myding continues through the marshes, eventually joining the Bahr-el-Zeraf (see p. 453) in its lower course.

Except for the Atem divergence the Nile, despite the swamps through which it passes, maintains a fairly definite course, with a considerable depth of water as far as Shambe, where, on the west, is a large lagoon. Five miles lower down the river splits into two great channels. That to the left, the main stream, continues to be

known as Bahr-el-Jebel, but is sometimes called by its Dinka name Kir. The right branch, or *Bahr-el-Zeraf* (Giraffe river), has a more easterly direction, and does not rejoin the main river until 50 m. below its confluence with the *Bahr-el-Ghazal* (*q.v.*). From the point of bifurcation the Bahr-el-Jebel flows for 230 m. in a general north-westerly direction until it is joined by the Bahr-el-Ghazal coming from the south-west. At the junction of the Bahr-el-Ghazal and the Bahr-el-Jebel in $9^{\circ} 29' N.$ the permanently submerged area is usually named Lake No, but the Arabs call it *Moghren-el-Bohur* (meeting of the rivers). Lake No in the rains covers about 50 sq.m.

In the Bahr-el-Jebel occur the great accumulations of "sudd" (*q.v.*), closely packed masses of floating vegetation which obstruct and, if not removed, prevent navigation (*see p. 455*). The aspect of the river throughout the sudd region is monotonous and depressing. On all sides stretch reaches of the reed known as *um suf* or mother of wool (*Vossia procera*), ambach, "bus" and papyrus. These grasses rise 15 to 20 ft. above the water, so as often to close the view like a thick hedge. The level of the flat expanse is broken only at intervals by areas of higher ground on which are mounds of earth erected by the white ants and covered with a clump of brushwood or trees; the moisture in the air is excessive; mosquitoes and other swamp flies swarm in myriads. Yet touches of beauty are not wanting; water lilies (*Nymphaea stellata*) and the sacred lotus of Egypt, *Nymphaea Lotus*—white, blue and crimson—often adorn the surface of the stream. Occasionally the rare and odd-looking whale-headed stork or *Balaeniceps rex* is met with among the reeds, and at night the scene is lit up by innumerable fire-flies.

The White Nile.—From the confluence with the Bahr-el-Ghazal at Lake No, the main stream, which here takes the name of *Bahr-el-Abiad*, or White river, adopts the easterly course of the tributary stream. Forty miles below the point where the Bahr-el-Zeraf reunites with the main branch, the Nile receives its first great eastern affluent—the Sobat (*q.v.*), whose head-streams rise in the mountains of south-west Abyssinia and the region north of Lake Rudolf. Just above the Sobat junction the Nile resumes its northern course. It passes through a great alluvial plain, stretching from the spurs of the Abyssinian highlands in the east, to the hilly districts of Kordofan in the west, and covered with high grass and scattered bush.

About 56 m. below the Sobat mouth, in $9^{\circ} 55' N.$, lies (on the left bank) Kodok (known as Fashoda until 1904), an Egyptian town founded in 1867 on the site of Denab, the old "capital" of the Shilluks, and famous for the crisis between England and France in 1898 through its occupation by the French officer Marchand. For the next 270 m. the scenery takes on a very monotonous appearance. The river flows in a wide channel bordered by a belt of forest on either bank. At Abu Zeid (about $13^{\circ} 5' N.$) for a distance of nearly 4 m. the river is extremely broad and shallow, being fordable at low water. Fifteen miles lower down, at Goz Abu Goma—which is the northern limit of the sudd vegetation—the river is divided into two channels by Abba Island, wooded, narrow and 28 m. long. On Abba Island lived, for some years before 1881, Mohammed Ahmed, the Mahdi. The White Nile with its volume of about 1,500 cu. metres per sec. in Oct., diminishing to about 550 cu. metres in May, is the main supplier of water to Egypt in the spring and early summer.

The Blue Nile.—Five hundred and twenty miles below the Sobat mouth and 1,652 m. from Ripon Falls, in $15^{\circ} 37' N.$, the White Nile is joined by its greatest eastern confluent the *Bahr-el-Azrak* or Blue Nile. In the fork of the two rivers stands Khartoum, the capital of the Anglo-Egyptian Sudan, whilst on the western bank of the White Nile is Omdurman, the former Mahdist capital. At Khartoum the water of the one river is of a greenish-grey colour, that of the other is clear and blue, except when in flood, when it gains a chocolate brown from the mineral matter in suspension. The Blue Nile, or Abai as it is called in Abyssinia, rises in the Gojam highlands in $11^{\circ} N.$ and $37^{\circ} E.$, and flowing northwards 70 m. enters Lake Tsana (*q.v.*) near its south-west corner, to issue again at the south-east end. The Abai and its tributaries drain a great part of the Abyssinian plateau. The complicated

river system is best understood by a study of the map. The Abai itself on leaving Lake Tsana makes a great semicircular sweep south-east to north-west, from the highlands of Ethiopia to the plains of Sennar. In this section of its course its swirling waters rush over a long series of cataracts and rapids, descending from a height of 5,770 ft. at the outlet to about 1,400 ft. at Fazokl or Famaka ($11^{\circ} 17' N.$, $35^{\circ} 10' E.$), where it crosses the Abyssinian frontier and flows through the plains of Sennar to its confluence with the White Nile at Khartoum, 1,300 ft. above sea-level.

Of the tributaries of the Abai the majority join it on its left bank. The Bashilo, Jamma and Muger, which reach the Abai in the order named, drain the country east of the main stream between the basins of the Takazze and the Hawash. The Guder, with a south to north course, rises in the mountains which form the watershed between the Nile and the Lake Rudolf basin. Next comes the Didessa, a large stream rising near the head-waters of the Baro (the main upper branch of the Sobat) and flowing north-west to the Abai, the confluence being in about $10^{\circ} N.$, $35^{\circ} 40' E.$ It has an early rise and a long flood period, being by far the most important tributary of the Blue Nile. The Dabus or Yabus rises about $9^{\circ} N.$, $34^{\circ} 30' E.$, and flowing north joins the Abai near the spot where that river breaks through the Abyssinian hills. All these affluents are perennial, as is the Bolassa or Yesien, a right-hand tributary which reaches the Abai below the Yabus.

Four miles below Famaka the river is joined on its left bank by the auriferous Tumat, an intermittent stream. In Sennar it receives on its right bank two considerable tributaries from the Abyssinian heights, the Dinder, a very long but not perennial stream, and the Rahad, waterless in the dry season, copious and richly charged with sediment during the rains from June to Sept. At this period the discharge of the Blue Nile rises from less than 200 to over 6,000 cu. metres per sec., thus greatly exceeding that of the White Nile itself, which is only from about 900 to 1,500 cu. metres during the flood. The length of the Blue Nile is about 850 m. The country, El Gezira, enclosed in the triangle formed by the junction of the White and Blue Niles forms the most fertile portion of the Sudan, and the portion now irrigated from the Blue Nile is producing excellent cotton crops and durra.

The Atbara.—Two hundred miles below Khartoum—at Ed-Damer—the Nile is joined by the last of its tributary streams—the Atbara or Bahr-el-Aswad (Black river). The Atbara, some 800 m. long, rises in the tableland north of Lake Tsana, being formed by the junction of the Angreb, Salaam, Aradeb, Goang and other mountain streams. Making its way towards the Nubian plains, the river flows in a north-westerly direction, joining, in $14^{\circ} 10' N.$, $36^{\circ} E.$, the Bahr Setit or Takazze (*see ABYSSINIA*), a river coming from the east and having a volume of water as large as, if not larger than, the Atbara. The united stream preserves, however, the name of Atbara, and at its confluence with the Nile has a breadth in flood time of over 600 yd. and a volume which exceeds 2,000 cu. metres per sec. in August. The Atbara and its tributaries, like many of those which feed the Blue Nile, rapidly dwindle after the rains. In its lower course the Atbara runs completely dry, but higher up water may be found in deep pools. These pools are full of fish, turtles, crocodiles and hippopotami, which remain imprisoned until the return of the flood. The country between the Nile proper, the Atbara and the Blue Nile is identified with the island of Meroë of ancient history.

The Cataracts.—Below the Atbara junction the Nile continues its course to the Mediterranean, traversing a distance of over 1,600 m. without receiving a single tributary on either bank. Below Khartoum the river makes a great S-shaped bend, and leaving behind the cultivable land, traverses the Nubian desert. In its progress the volume of water suffers continual diminution from evaporation, owing to the extreme dryness of the air. The valley of the river is here very narrow, and the desert land in places comes right to the water's edge. Elsewhere high and barren cliffs shut in the valley. Between Khartoum and Wadi Halfa (the northern end of the great bend), a distance of over 900 m., occurs a series of cataracts, known as the 2nd, 3rd, 4th, 5th and 6th (the 1st cataract is lower down the river at Assuan). That first met with on descending the river from Khartoum is the 6th (or

Shabluka) cataract. The river here (50 m. below Khartoum) is picturesque, flowing rapidly in a narrow gorge for 8 m., but the fall is only 2 ft. After 188 m. of smooth water the 5th cataract is reached. It begins 28 m. below Berber (a town on the right bank at the head of a caravan route to the Red Sea), and with three principal rapids extends for 100 m.—the drop in this distance being rather more than 80 ft. At the foot of this cataract is the town of Abu Hamed, at the eastern end of the middle of the S bend. The 4th cataract begins 60 m. down stream from Abu Hamed. It is 80 m. long and has a drop of 110 ft. Between the 4th and 3rd cataracts there is a stretch of 200 m. on a very gentle slope ($\frac{1}{12,500}$). This reach constitutes the province of Dongola, and here the cultivable land on the western side of the river is of greater extent than usual in the desert zone. The 3rd cataract, 45 m. long, has a drop of some 36 ft. After another smooth reach extending 73 m. the 2nd cataract, which ends just above Wadi Halfa, the northern frontier town of the Anglo-Egyptian Sudan, is reached. This cataract is 124 m. long and has a fall of 216 ft. Between the 2nd cataract and Assuan are 214 m. of smooth water with a scarcely perceptible slope, ($\frac{1}{12,500}$). The average breadth of the river here is 1,640 ft.

Lower River and Delta.—For some distance above Assuan the river is studded with islands, including those of Philae and Elephantine. The rapids south of the town used to form the 1st cataract, where, in a length of 3 m., the river fell 16½ ft. Since the completion of the great dam and locks at the head of these rapids they have to a certain extent disappeared, and a navigable channel has been formed. The dam, pierced by 180 sluices, stretches across the river—a wall 2,000 yd. long below which the water rushes between rocks in many channels (these being the relics of the cataract). Upstream from the dam a lake some 100 m. in length has been formed. The Assuan Dam was opened on Dec. 10, 1902 (see under IRRIGATION). A ladder of four locks on the western side of the dam permits navigation between the upper and lower reaches. At Assuan the banks of the river are bordered by high granite hills. From this point to the apex of the delta the length of the Nile is 605 m. with a slope ($\frac{1}{18,000}$) even slighter than that above Assuan. The valley is comparatively narrow, being an almost level depression in a limestone plateau and the area of fertility ends where the land ceases to be irrigated by the river. At Esna, 100 m. below Assuan, a barrage, known as the Esna barrage, regulates the flow of the water, and at Assiut, 345 m. below Assuan, is another barrage fulfilling the same purpose, and a third at Nag Hamadi, about 215 m. below Assuan was under construction in 1928. Cairo stands on the eastern bank of the Nile 12 m. north of the apex of the delta.

At the beginning of the delta the Nile separates into two channels, the *Rosetta* and the *Damietta*, which join the Mediterranean at its south-east angle. In ancient times the delta was watered by seven branches; five of these branches are now canals not always navigable. The ancient branches were, beginning at the west, the Canopic, Bolbitine, Sebennytic, Phatnitic, Mendesian, Tanitic and Pelusiatic, of which the modern Rosetta and Damietta branches represent the Bolbitine and Phatnitic. At the head of the river is a double barrage, by means of which the water can be dammed to the height required for forcing the water into the canals which irrigate the delta. Of the two branches the Damietta is the more easterly. Both are about the same length—146 m. Behind the coast-line, which is low and sandy, are a number of salt marshes or lagoons. Whilst the Damietta branch is gradually silting up, the Rosetta branch is scouring out a wider channel. At full flood the depth of water in either branch is about 23 ft.

Hydrography.—The fertility and prosperity of Egypt and the northern part of the Sudan being entirely dependent on the irrigation of the land by the waters of the Nile, the variation in the supply at different seasons of the year is of vital importance. (In Egypt the height of the flood has been recorded annually, as the chief event of the year, since at least 3600 B.C.) Above the Sobat confluence the Nile traverses a region of heavy rainfall and the water-supply is super-abundant. It is from Victoria, Albert and Edward lakes and their feeders, and in a very small degree from the Bahr-el-Ghazal, that this river obtains its constant supply of

water throughout the year. The great lakes retaining a large proportion of the water they receive, act as natural reservoirs and prevent the lower Nile from ever running dry in summer. The Abyssinian affluents are the source of the Nile flood. In the equatorial regions rainfall varies from 30 to 80 in. during the year with a mean of about 50. It is heaviest in the months of Jan., Feb., March and April, and again in Oct. and November. The most rainy portions of the lake plateau (where alone occurs a rainfall of 60 in. and over) lie along the eastern edge of the Albertine Rift valley, and west and north of Victoria lake. These rains feed Edward and Albert lakes, and, through the Kagera, supply a great part of the water of Victoria lake. The water in Lake Victoria begins to rise in Jan., the rise becomes marked in June, is at its height in July, the level of the water reaching its lowest at the end of November. The Bahr-el-Jebel is at its lowest in March and April and at its highest in September. The seasonal supply of the Bahr-el-Ghazal hardly varies, the maximum levels occurring in Nov. and Dec., and it has but a slight discharge. The Sobat, from Dec. to March, is at its lowest, and is in flood from June to Oct., during which period the water (milky coloured) which it pours into the Nile is two or three times the volume of the main stream. It is the colour of the Sobat water which gives its name to the White Nile. The Blue Nile, at its confluence at Khartoum, begins to rise in June and is in flood from July to Oct.; the Atbara is also in flood during the same months. The great difference in the supply of water from the equatorial regions and from Abyssinia arises from the fact that the first-named district is one of heavy rain practically all the year round, whereas in Abyssinia the season of heavy rain is usually limited to the months of June to September. Reduced to its simplest expression, the Nile system may be said to consist of a great steady flowing river fed by the rains of the tropics, controlled by the existence of a vast head reservoir, and annually flooded by the accession of a great body of water with which its eastern tributaries are flushed.

At Khartoum the Nile is lowest in April and May and highest in Aug. and September. Its minimum depth is 18 ft. and its maximum depth 25 ft. At Assuan the Nile is at its lowest at the end of May, then rises slowly until the middle of July, and rapidly throughout Aug., reaching its maximum at the beginning of Sept.; it then falls slowly through Oct. and November. At Cairo the lowest level is reached about the middle of June, after which the rise is slow in July and fairly rapid in Aug., reaching the maximum at the beginning of October. By using the water stored by the Assuan dam in the months following high Nile, the river lower down has been, since 1902, replenished at times of low water to meet the needs of cultivators (see IRRIGATION: *Egypt*). At Assuan the average rise of the Nile is 26 ft., at Cairo it is 23 ft. A rise of 21 ft. only at Assuan is a "bad Nile"; on the other hand, a rise of 30 ft. causes a danger of flood, or rather it used to do so previous to the building of the dam.

When the Nile below the swamps is at its lowest, the water acquires a green colour and a putrid taste and smell due to innumerable microscopic green algae, which grow freely in the conditions of heat and nearly stagnant water which prevail in some reaches of the river at low stage. This "green water" is seen at Cairo about the end of June or beginning of July, and passes away with the first rise in the later month, the algae being unable to live in turbid water. By Aug. the river in lower Egypt is full of dark red-brown sediment brought down by the Blue Nile and the Atbara from the plateaus of Abyssinia. It is estimated to be then carrying 8 cu.yd. per sec.; by Sept. this has been reduced to half the amount, and then diminishes rapidly. It has been calculated¹ that the time taken by the water to travel from Khartoum to the delta barrage varies from 14 days in Sept. to 42 in May.

On the island of Elephantine at Assuan is the famous Nilometer, dating from ancient Egyptian times, altered and extended in Roman times and repaired in 1870 by the Khedive Ismail. It is a stairway in the river quay wall built of hewn stones, marked with scales to record the level of the water of the river. The

¹By Sir Hanbury Brown, inspector-general of irrigation, Lower Egypt, 1892-1903.

remains of other ancient Nilometers exist at Philae, Edfu and Esna, together with inscriptions recording about forty high Niles in the XXVth Dynasty, discovered on a quay wall of the temple of Karnak. The data furnished by these give about $4\frac{1}{2}$ in. per century as the average rate at which the Nile is silting up its bed north of the 1st cataract. The present level of high Nile at the Semna rapids, between the 2nd and 3rd cataracts is 24 ft. lower than that indicated by the marks sculptured c. 2500 B.C. This fall is attributed to the erosive action of the water as it passes over the hard gneiss which at Semna forms a barrier across the stream. The vertical extent of such erosion is equal to about two millimetres a year. There are now gauges for registering the rise of the water at Cairo, Assuan, Berber and Khartoum on the main river; at Wad Medani, Sennar and Roseires on the Blue Nile; El Duem and Malakal on the White Nile; Nasser on the Sobat; Mongalla on the Bahr-el-Jebel; and Ugowe, Jinja and Entebbe on Victoria Nyanza.

Navigation.—At high Nile there is uninterrupted water-communication from the sea to Fort Berkeley in $4^{\circ} 40' N.$ —a distance of 2,900 m. Owing to the cataracts, navigation between Assuan and Khartoum is impossible during low Nile, and from March 1st to Aug. 1st the upper courses of the Damietta and Rosetta branches are closed to navigation; the water being utilized for summer irrigation in the delta. As far as Mansura (60 m.) on the Damietta branch and Kafr-el-Zayat (70 m.) on the Rosetta branch, and between Khartoum and Fort Berkeley (1,090 m.) the river is navigable all the year round, though between the Sobat confluence and Bor, navigation is dependent on the channel being kept clear of sudd. Above Fort Berkeley navigation is interrupted by the rapids and cataracts which extend to Dufile, but from the last-named town to Fajao at the foot of the Murchison Falls (a distance of 150 m.) the river is navigable throughout the year. There is a further navigable stretch between Fowcira (just above the Karuma rapids) and the southern end of Lake Kioga. The Blue Nile is navigable for steamers during flood time from its confluence at Khartoum to Roseires at the foot of the Abyssinian hills, a distance of 426 m. At low water small boats only can go upstream. The Atbara is never navigable, the current during flood time being too swift for boats. Including the Sobat and the Bahr-el-Ghazal the navigable waters of the Nile and its affluents exceed 4,000 m. (W. E. G.; F. R. C.)

HISTORY

Story of Discovery.—Few problems in geographical research exercised for so long a period so potent an influence over the imaginations of man as that of the origin of the Nile. The ancient Egyptians, as is apparent from the records on their monuments, were acquainted with the main stream as far south as the junction of the White and Blue Niles. They appear also to have known the Blue Nile up to its source and the White Nile as far south as the Bahr-el-Ghazal confluence. Beyond that point the sudd probably barred progress. The knowledge acquired by the Egyptians passed to the Persians and Greeks. Herodotus (about 457 B.C.) ascended the Nile as far as the First Cataract. He was led to believe that the source of the river was far to the west—in the region of Lake Chad. Eratosthenes, superintendent of the Alexandrian library, in a map made about 250 B.C., showed, with fair accuracy, the course of the river as far as where Khartoum now stands. He showed also the Atbara and Blue Nile. Eratosthenes was the first writer to hint at equatorial lakes as the sources of the river. Juba II., king of Mauretania (who died about A.D. 20), in his *Libyca*, quoted by Pliny, makes the Nile rise in western Mauretania, not far from the ocean, in a lake presenting characteristic Nile fauna, then pass underground for several days' journey to a similar lake in Mauretania Caesariensis, again continue underground for twenty days' journey to the source called Nigris on the borders of Africa and Ethiopia, and thence flow through Ethiopia as the Astapus. This remarkable story received considerable credence, and may be connected with the theory which made the Niger a branch of the Nile (see below). Strabo (a contemporary of Juba), who ascended the river as far as Syene, states that very early investigators had connected the

inundation of the Lower Nile with summer rains on the far southern mountains, and that their theory had been confirmed by the observations of travellers under the Ptolemies. About the same time Dailon, a Greek, is believed to have ascended the White Nile. Nero despatched two centurions on an expedition for the express purpose of exploring the Nile, and Seneca states that they reached a marshy impassable region, which may be easily identified with the country of the White Nile above the mouth of the Sobat. To what they referred when they reported a great mass of water falling from between two rocks is not so readily determined. During this period more accurate knowledge concerning the Nile sources was obtained from the reports of Greek traders who visited the settlements on what is now called the Zanzibar coast. A merchant named Diogenes returning (about A.D. 50) from the east coast of Africa told a Syrian geographer, Marinus of Tyre, that journeying inland for twenty-five days he reached the neighbourhood of two great lakes and a range of snow mountains whence the Nile drew its sources. Marinus published this report in his geographical works. This book is lost, but the information is incorporated in the writings of Ptolemy, who in his book and map sums up all that was known or surmised of the Nile in the middle of the 2nd century of the Christian era. Ptolemy writes that two streams issuing from two lakes¹ (one in 6° and the other in $7^{\circ} S.$) unite in $2^{\circ} N.$ to make the Nile, which, in $12^{\circ} N.$, receives the Astapus, a river flowing from Lake Coloe (on the equator). His two southern lakes, he conceived, were fed by the melting of snows on a range of mountains running east and west for upwards of 500 m.—the Mountains of the Moon, τὸ τῆς σελήνης ὄρος, *Lunae Montes*. It will be seen that, save for placing the sources too far to the south, Ptolemy's statements were a near approximation to the facts. The two southern lakes may be identified with the Victoria and Albert Nyanzas, and Lake Coloe with Lake Tsana. The snow-capped range of Ruwenzori occupies—at least in part—the position assigned to the Mountains of the Moon, with which chain Kilimanjaro and Kenya may also be plausibly identified. On all the subsequent history of the geography of the Nile Ptolemy's theory had an enormous influence. Mediaeval maps and descriptions, both European and Arabian, reproduce the Mountains of the Moon and the equatorial lakes with a variety of probable or impossible modifications. Even Speke (see p. 456) congratulated himself on identifying the old Ptolemaean range with the high lands to the north of Tanganyika, and connected the name with that of Unyamwezi, the "country of the moon."

In the fourteen centuries after Ptolemy virtually nothing was added to the knowledge of the geography of the Upper Nile. Arab writers of the 12th and 13th centuries make mention of the great lakes, and their reports served to revive the interest of Europe in the problem of the Nile. Idrisi made both the Nile and the Niger issue from a great lake, the Niger flowing west, the Nile north. Hence arose much confusion, the Senegal estuary being regarded by its discoverers (1445) as the mouth of a western branch of the Nile. Even until the early years of the 19th century the belief persisted in a connection between the Nile and the Niger (see further NIGER). Portuguese explorers and missionaries, who in the 15th and 16th centuries visited the east coast of Africa and Abyssinia, gained some information about the equatorial lake region and the Nile, the extent of the knowledge thus acquired being shown in the map of Africa of Filippo Pigafetta, Italian traveller and historian (1533–1603) published in 1580. It was not, however, till the 17th century that the sources of the Blue Nile were visited by Europeans. In 1615 Pedro Paez, a Portuguese priest, was shown them by the Abyssinians. Ten years later another Portuguese priest, Jeronimo Lobo, also visited the sources and left a vivid description of the rise of the river and its passage through Lake Tsana. An English version of the accounts of Paez and Lobo—written by Sir Peter Wyche—was published in 1669 by order of the Royal Society, of which Sir Peter was an original Fellow. Between 1625 (the date of Lobo's visit) and 1770, some attempts were made by French and other

¹The two lakes afterwards received the names Lake of Crocodiles and Lake of Cataracts.

travellers to explore the Blue Nile, but they ended in failure. In the last-named year James Bruce (*q.v.*) reached Abyssinia, and in Nov. 1772 he arrived in Egypt, having visited the source of the Blue Nile and followed it, in the main, to its confluence with the White Nile. On returning to Europe Bruce was mortified to find that whilst he was still in Egypt the French geographer D'Anville had (1772) issued a new edition of his map of Africa in which by a careful study of the writings of Paez and Lobo he had anticipated Bruce's discoveries, D'Anville's map is singularly accurate, if we remember the scanty information at his disposal. To Bruce, nevertheless, belongs the honour of being the first white man to trace the Blue Nile to its confluence with the White Nile. He himself, considering the Blue Nile as the main branch of the river, claimed to be the discoverer of the long-sought *caput Nili*.

From the time of Bruce, interest in the Nile problem grew rapidly. The Englishman, W. G. Browne (*q.v.*) when in Darfur (1794-1796) heard that the Abiad rose far south in the Mountains of the Moon, but he makes no mention of the great lakes, and in Major Rennell's map of 1802 there is no hint of equatorial lakes at the Abiad sources. During the French occupation of Egypt the river from the sea to Assuan was accurately surveyed, the results being embodied in Jacotin's *Atlas de l'Égypte* (1807). In 1812-1814 J. L. Burckhardt, the Orientalist, went up the Nile to Korosko, travelled thence across the desert to Berber and Shendi, and crossing the Atbara made his way to the Red Sea. It was, however, due to the initiative of Mohammed Ali, Pasha of Egypt, that the White Nile was explored. In 1820-22 a military expedition under Ismail Pasha, a son of Mohammed Ali, which was joined by the French scientist Frédéric Cailliaud (who had visited Meroë in 1819) ascended the river to the confluence of the White and Blue Niles, founded the city of Khartoum, and ascended the Blue Nile to Fazokl. In 1827 Adolphe Linant, a Belgian in the service of the British African Association, ascended the White Nile 132 m. above Khartoum, being the first white man to do so since the 1st century A.D. Then followed three Egyptian expeditions sent in 1830-41 and 1842 by Mohammed Ali up the White Nile. The first expedition reached, on Jan. 28, 1840, a point 6° 30' N., the second and third pressed further south, reaching 4° 42' N.—or the foot of the rapids above Gondokoro. A Turkish officer, Selim Bimbashi, commanded the expeditions, and among the members were the Frenchmen Thibaut (a convert to Islam and for nearly forty years French consular agent at Khartoum), D'Arnaud and Sabatier, and a German, Ferdinand Werne. The last-named wrote a scientific account of the second expedition and drew a map of the Nile between Khartoum and Gondokoro. An Austrian Roman Catholic mission was established in the Sudan, and in 1850 one of its members, Dr. Ignatz Knoblecher, sent to Europe reports, gleaned from the natives, of the existence of great lakes to the south. About the same time two Protestant missionaries, Ludwig Krapf and John Rebmann, stationed on the Zanzibar coast, sent home reports of a vast inland sea in the direction where the Nile sources were believed to be. This sea was supposed to extend from 0° 30' N. to 13° 36' S. These reports revived interest in Ptolemy's Geography. The exploration of the Bahr-el-Ghazal by John Petherick, Miss Tinné and her companions, and others followed the opening of the White Nile (*see* BAHR-EL-GHAZAL). The result of the work carried on from the north was that by 1858 the Nile system was known as far south as the rapids at Bedden.

On Aug. 3, 1858 the English explorer J. H. Speke (*q.v.*) discovered the large *nyanza* (lake), which he rightly conceived to be the head reservoir of the White Nile, and which in honour of the queen of England he named Victoria Nyanza. Captain (Sir Richard) Burton and Speke had gone inland from Zanzibar to investigate the reports concerning the vast lake which Rebmann and Krapf had called the Sea of Unyamwezi. These reports proved to be exaggerated accounts of three distinct lakes—Nyasa, Tanganyika and Victoria Nyanza. In 1860 Speke returned to Zanzibar accompanied by J. A. Grant (*q.v.*), bent on solving the problem of the Nile. In spite of great difficulties he made his way to Uganda, on the north-west of Victoria Nyanza and (without exploring the lake) succeeded in reaching its outlet. On the 28th of July 1862 Speke stood by the Ripon Falls—the birthplace of

the Nile. In his journey he had discovered the Kagera river, now known to be the most remote headstream of the Nile, a fact of which Speke was uncertain, though he recognized that it was the largest river entering the nyanza. Speke and Grant paddled down the Nile a short distance, but before reaching Lake Kioga they were stopped by hostile natives and compelled to go westward to Unyoro. There they heard of another great lake farther west, but the king of Unyoro refused them permission to visit it. In the end they descended the Kafu river to its confluence with the Nile and then down the main stream to the Karuma Rapids. Here Speke and Grant left the river, and travelled overland east of the stream, which they did not strike again until just above the Ausa confluence. Thence they travelled down the Nile to Gondokoro, reached on Feb. 15, 1863.

This remarkable journey virtually solved the Nile problem so far as the source of the main stream was concerned, but there remained much to be done before the hydrography of the whole Nile basin was made known. At Gondokoro, Speke and Grant met Mr. (afterwards Sir Samuel) Baker and his wife—a Hungarian lady—who had journeyed thither to afford the explorers help. To Baker, Speke communicated the news he had heard concerning the western lake, and this lake Baker determined to find. On the 26th of March 1863 Baker and his wife left Gondokoro, and despite much opposition, especially from slave-dealers, followed, in the reverse direction, the route of Speke and Grant as far as Unyoro, whence they journeyed west. On March 14, 1864, they struck the lake (Albert Nyanza) on its south-east side. They paddled up the lake to the point where a large river coming from the east poured its waters into the lake. This stream, which they rightly conjectured to be Speke's Nile, they followed up to the Murchison Falls. Thence they went overland to the Karuma Rapids, and so back to Gondokoro by their old tracks. It fell to the lot of General C. G. Gordon (when that officer administered the Egyptian Equatorial provinces) and his assistants to fill up the gap left by Speke and Baker in the course of the main stream. In 1874-75 two English engineer officers—Lieut. (afterwards Colonel Sir Charles M.) Watson and Lieut. H. Chippendall—followed the river between Gondokoro and Albert Nyanza; in 1876 an Italian, Romolo Gessi Pasha, circumnavigated that lake, proving Baker's estimate of its size to be vastly exaggerated; Gordon in the same year traced the river between Murchison Falls and Karuma Rapids, and an American, Colonel C. Chaillé-Long followed (1874) the Nile from the Ripon Falls to the Karuma Rapids, discovering in his journey Lake Kioga (which he named Ibrahim). In this manner the identity of the Victoria Nile with the river which issued from the Albert Nyanza was definitely established.

In 1874 H. M. Stanley (*q.v.*) went to Africa with the object of completing the work left unfinished by David Livingstone, who believed, erroneously, that the ultimate sources of the Nile were far to the south (*see* CONGO). Stanley, in 1875, circumnavigated Victoria Nyanza, setting at rest the doubt thrown on Speke's statement that it was a huge sheet of water¹, but proving Speke mistaken in believing the Nyanza to have more than one outlet. On the same journey Stanley encamped at the foot of the Ruwenzori range, not knowing that they were the "Mountains of the Moon," whose streams are the chief feeders of Albert Nyanza. (At the time of his visit the snow-peaks and glaciers were hidden by heavy clouds.) In 1888, however, Stanley saw the mountains in all their glory of snow, and ice, discovered Albert Edward Nyanza, and traced the river (Semliki) which connects it with Albert Nyanza. The Semliki had been discovered, and its lower course followed in 1884 by Emin Pasha. Thus at length the riddle of the Nile was read, though much was still to do in the matter of scientific survey, and in the exploration of the valley of the Sobat (*q.v.*). The Kagera had been partly explored by Stanley (1875), by whom it was called the Alexandra Nile, and between 1891-98 its various branches were traced by the German travellers Oscar Baumann, Richard Kandt and Captain H. Ramsay, and by Lionel Dècle, a Frenchman. A British officer, Colonel C. Delmé-Radcliffe, made the first accurate survey (1900-1901) of the

¹In the map issued in 1873 to illustrate Schweinfurth's book, *The Heart of Africa*, Victoria Nyanza is shown as five small lakes.

Nile between Albert Nyanza and Gondokoro. In 1903 an Anglo-German commission under Colonel Delmé-Radcliffe and Captain Schlobach made a detailed survey of the Kagera from 30° E. to its mouth. The Kioga system was surveyed in 1907-08 by Lieut. C. E. Fishbourne. A trigonometrical survey of the upper river was begun by Colonel M. G. Talbot, director of Sudan surveys, in 1900, and since then much has been done by the Sudan Survey Department and the Irrigation Service.

The Removal of Sudd.—The sudd (see p. 452, *The Region of Swamps*) above the Sobat confluence seems to have stopped the Roman centurions sent by the emperor Nero to explore the Nile. When the river above the Sobat was again reached by white men (1840) the stream was clear of sudd, and so continued until 1863-1864, when both the Bahr-el-Jebel and the Bahr-el-Zeraf became blocked by floating masses of vegetation. When Baker proceeded to Gondokoro in 1870 he thus described the increase that neglect had caused in the obstruction: "The immense number of floating islands that were constantly passing down the stream of the White Nile had no exit; thus they were sucked under the original obstruction by the force of the stream, which passed through some mysterious channel, until the subterranean passage became choked with a wondrous accumulation of vegetable matter. The entire river became a marsh, through which, by the great pressure of water, the stream oozed through innumerable small channels. In fact, the White Nile had disappeared." Baker, who had to cut through 50 m. of sudd in his passage to Gondokoro, urged the Khedive Ismail to reopen the Nile. This work was efficiently done by Ismail Ayub Pasha, and the White Nile was clear for large vessels when Gordon reached Khartoum in 1874. The river did not long remain free, for in 1878 Emin Pasha was unable to ascend the Bahr-el-Jebel from the south on account of sudd. It was cleared in 1879-80 by officials in the Egyptian service, but had again accumulated in 1884. In consequence of the Mahdist movement nothing could then be done to clear the river, and the work was not taken in hand again until 1899, when, by direction of Sir William Garstin, the under secretary of state for public works in Egypt, an expedition under Major Malcolm Peake, R.A., was sent to cut through the sudd, which then extended from the Bahr-el-Ghazal confluence almost to Gondokoro. During 1900 a channel was cut through the northern and heaviest portion of the sudd. The work was one of much difficulty, some of the blocks being 1 m. long and 20 ft. deep; the water beneath flowed with great velocity. To remove the obstruction the surface was first burnt; then trenches were cut dividing the sudd into blocks 10 ft. square, and each of these was hauled out with wire hawsers and chains by gunboats working from below. For a distance of 172 m. north of Shambe (i.e., about midway between the Ghazal confluence and Gondokoro) the true bed of the river could not, in many places, be found, but Major Peake forced a passage to Gondokoro through a spill channel or series of shallow lakes lying west of the main stream. In 1901 Lieut. Drury, a British naval officer, removed many of the remaining blocks of sudd, opening to navigation a further 147 m. of the river. Beyond this point for a distance of 25 m. the Bahr-el-Jebel could not be traced, so completely was the channel choked by sudd. In 1902, however, Major G. E. Matthews discovered the true bed of the river, which by 1904 was completely freed from obstructions, and freedom of navigation between Khartoum and Gondokoro was permanently secured. The effect of the sudd-cutting operations on the supply of water available for irrigation purposes in the lower river was slight but it has made it available for transport, and communication up to Rejaf is now regularly maintained.

Political Relations.—Explored in part by Egyptian government expeditions, the upper Nile as far south as Albert Nyanza became subject, between 1840 and 1882, to Egypt. Possession of the greater part of the river above Wadi Halfa then fell to the followers of the Mahdi. In 1896-98 an Anglo-Egyptian army reconquered the country, and from Victoria Nyanza to the Mediterranean the main river came under British or Egyptian administration. The west bank of the Bahr-el-Jebel, as far north as 5° 30' N., was in 1894 taken on lease from Great Britain by the Congo Free State during the sovereignty of Leopold II., the territory

leased being known as the Lado enclave (q.v.), but the lease was terminated in 1910.

BIBLIOGRAPHY.—For the story of exploration, see the works of Bruce, Speke, Grant, Baker and other travellers (whose books are mentioned in the biographical notices). Their achievements, and those of ancient and mediaeval explorers, are ably summarized in *The Story of Africa*, vols. ii. and iii., by Dr. Robert Brown (1893-04), and *The Nile Quest*, by Sir Harry Johnston (1903). See also J. Pertsch, *Des Aristoteles Buch: "Über das Steigen des Nil"* (Leipzig, 1909). For the Kagera region consult *Caput Nili*, by Richard Kandt (Berlin, 1904). Latest additions to geographical knowledge are recorded in the *Geographical Journal* (London) and the *Cairo Scientific Journal*. For the hydrography, geology and climate see *The Physiography of the River Nile and its Basin*, by Captain H. G. Lyons, director-general, survey department, Egypt (Cairo, 1906), an authoritative work, and numerous other publications of the Survey of Egypt and of the Physical Department; "Notes on the History of the Nile and its Valley," by W. F. Hume, in *Geog. Jnl.* (Jan. 1906); *Egyptian Irrigation* (2nd ed., 1899) and the *Nile Reservoir Dam at Assuan and After* (1901), both by Sir William Willcocks; the *Annual Reports* (1899 and after) of the Egyptian Public Works Department. Of special value is the Blue Book *Egypt No. 2, 1904*, which is a report by Sir William Garstin on the basin of the upper Nile, dealing at length with the lake area, the Nile affluents and the main river as far south as Khartoum, from the topographical as well as the hydrographical aspect. Sir W. Garstin and Captain Lyons give full bibliographical notes.

The study of the zoology of the Nile valley was the special object of a Swedish scientific expedition in 1901, under the direction of Prof. L. A. Jägerskiöld. The *Results* were published at Uppsala, pt. iii. appearing in 1909. For the botanical and other aspects of the Nile valley, see the works of Petherick, Heuglin, Schweinfurth, Junker and Emin. (F. R. C.)

DISTRIBUTION OF WATERS

Although the geographical problems connected with the origin of the river have been solved, the Nile continues to offer problems of extraordinary interest in connection with the conservation and distribution of its waters. The energy formerly directed to exploration has only been diverted to a closer and more scientific study of the hydrography of the river, with a view to determining how the available flow of water in its various tributaries can be most advantageously and economically protected from dissipation and wastage in the swamps of the upper river, and stored in reservoirs for utilisation as required. These studies have mostly been directed by the Egyptian Government to increasing the flow of the river in the early summer months, when its natural flow falls short of requirements for irrigation in Egypt; it has come to be realised that the control of the Nile waters is not wholly an Egyptian question but concerns the countries higher up the river.

The Assuan, Gebel Aulia and Makwar Dams.—The original Assuan dam, which was opened in 1902, was raised in height by seven metres in 1912 and the storage capacity of the reservoir increased from 1,000 million cu. metres to 2,250 million cu. metres of water. Following on Sir William Garstin's report on the basin of the Upper Nile (British Blue Book, *Egypt No. 2, 1904*), schemes for constructing a large reservoir on the lower White Nile by means of a dam at Gebel Aulia some 20 m. south of Khartoum, and for a canal to irrigate the great Gezira plain between the Blue and White Niles, began to take definite form about 1913. Progress with these schemes was necessarily suspended during the World War, and in the meanwhile the increasing tendency towards the development of an independent existence by the Sudan caused all schemes for the control of the river beyond the limits of Egypt proper to be viewed with some apprehension and mistrust in Egypt. The general position was summed up to date by the then adviser to the Egyptian Ministry of Public Works, Sir Murdoch MacDonald, in *Nile Control* (published by the Egyptian Government in 1920), and an international commission was appointed by the Egyptian Government to report on the proposed works.

The commission reported favourably on the general scheme outlined in *Nile Control*, and pointed out that under a carefully considered scheme of control there was sufficient water to meet any possible developments in both Egypt and the Sudan for many years to come. Financial considerations, complicated by the political position, again led to the temporary suspension of the works and to the preparation of further reports on the irrigation programme by Mr. C. E. Dupuis, formerly adviser to the Egypt-

tion Ministry of Public Works (issued by the Egyptian Government in 1925). The construction of the Gezira canal was then resumed by the Sudan Government, and the canal, with its great dam and reservoir, with a capacity of nearly 500,000 million cu. metres of water, at Makwar, near Senaar, on the Blue Nile, was completed to the extent necessary for the irrigation of 300,000 ac. in 1925, and formally opened in 1926. The Egyptian Government also started preliminary work on the Gebel Aulia dam and reservoir (White Nile), with a storage capacity of about 2,500 million cu. metres of water, and is studying the scheme for the canalization of the river through the swamps, on which some preliminary work was done between 1904 and 1913. (See DAMS; IRRIGATION.) At present work at Gebel Aulia has been suspended and the heightening of the Assuan Dam by 8 metres is under consideration.

Lake Albert.—It is further recognized that to be fully effective this canalization of the river must be supplemented by further storage works higher up the river, presumably by the conversion of Lake Albert into a reservoir, but this scheme has not yet emerged from the stage of preliminary consideration. The most recent information concerning the physical conditions and régime of the great lakes forming the basin of the upper White Nile, essential to the consideration of this project, has been collected in a report on *The Lake Plateau Basin of the Nile* by Mr. H. E. Hurst (published by the Egyptian Government in 1925).

Lake Tsana.—The study of the possibilities of Lake Tsana as a reservoir for the Blue Nile, originally reported on by Mr. C. E. Dupuis in 1903, has been continued by expeditions visiting the lake under Mr. A. B. Buckley in 1916-17, and under Mr. G. W. Grabham in 1920-21. The results of these studies were published by the Egyptian Government and the *Report of the Mission to Lake Tsana in 1920-21* by Messrs. G. W. Grabham and R. P. Black is particularly full and interesting. All reports agree in emphasising the extreme suitability of Lake Tsana for conversion into a reservoir of a capacity of between 3,000 and 4,000 million cu. metres. The political questions arising from the gradual conversion of the Nile from a natural river into an artificially regulated stream, whose flow is controlled by reservoirs at various points on its course in several different countries, have begun to make themselves felt, and a comprehensive solution of the resulting difficulties has yet to be found.

Navigation and Water Power.—From the point of view of navigation and trade no new developments have taken place on the Nile in recent years. The river remains a most useful highway for local traffic in the various sections into which its length of 4,000 m. is divided by the occurrence of falls and rapids; but the nature of these breaks is such that the development of through traffic on any scale is never likely to be economically possible. There are considerable possibilities for the development of water-power on the Nile especially at the Ripon and Murchison falls in Uganda; and the utilization of the large amount of power running to waste at the Assuan dam has been repeatedly considered and discussed; but the localities in which these opportunities occur are remote, and no useful application of them to practical purposes has yet been devised; in the case of Assuan the intermittent character of the power obtainable, which though very large when the reservoir is full in the early part of the year is practically nil during the flood season, has hitherto proved an insurmountable objection to economic utilization. (C. E. D.)

NILE, BATTLE OF THE. The battle of the Nile was fought in Aboukir Bay, near Alexandria, on Aug. 1, 1798. It arose out of Napoleon's famous Egyptian Expedition, the first news of which had reached Jervis, off Cadiz, earlier in the year, in the shape of rumours of great activity in the port of Toulon. In the previous year the first European coalition against revolutionary France had been finally dissolved by the elimination of Austria, the result being that in 1798 France was at war with England only, and this eastern expedition with its proposed, though unlikely, result of an attack on India, was considered by Napoleon to be the most hopeful means of embarrassing England, while at the same time keeping himself in the limelight. As soon as Jervis heard of the preparations at Toulon, the object of which was, of

course, unknown to him, he despatched Nelson with a small force to reconnoitre, and soon afterwards he had an opportunity of reinforcing him. Pitt was trying to build a new coalition against France, and was approaching Austria who made England's re-entry into the Mediterranean, which she had been forced to evacuate, a condition of acceptance. Jervis was thus ordered to send a detachment through the Straits of Gibraltar with instructions to find out whether a re-entry into the Mediterranean was feasible; what he did was to reinforce Nelson so as to bring his strength up to 14 ships, 13 of them seventy-fours and one a fifty.

Before Nelson was joined by his reinforcements and while he commanded only three seventy-fours and some frigates, he was forced from his station, off Toulon, by a gale. He suffered severely in this and—perhaps worst misfortune of all—was separated from his frigates which went to Gibraltar in the expectation that the admiral would go there to refit. The absence of "the eyes of the fleet" during the ensuing search for the French was obviously a great handicap. The remaining ships were repaired somehow and by May 31 they were back off Toulon, having been absent ten days, but the French were gone. The direction of the wind led Nelson to believe that the kingdom of the two Sicilies was the danger-point, and that the French had not made for the Straits of Gibraltar as it was believed in England they would. Consequently he made for the Bay of Naples, and on June 7 was joined by the reinforcements from Jervis. Malta was the next point at which it was decided to aim, but, while the fleet was in the neighbourhood of Cape Passaro, news reached it that the island had fallen to the French. It was this news that shook the public confidence, generally so strong, in Nelson, and for a time it was considered that he was being out-manoeuvred. The problem before him was certainly a hard one. With the intuition, however, for which he was so famous, he decided on Egypt as Napoleon's next stopping-place, and made sail for Alexandria. He found it empty and impetuously left, on June 30, to search elsewhere. On the following day the French arrived, actually sighting the topsails of the last ships of the departing English fleet, which ranged the coast of Asia Minor in its search and finally arrived at Syracuse. Here, by the kind influence of Lady Hamilton with the Neapolitan court, the fleet was entirely revictualled and immediately sailed again for the East. After further searching, Nelson decided to try Alexandria once more, and this time was rewarded by the sight of the republican tricolour floating over the town. A little later the French fleet could be seen anchored in Aboukir Bay. The long search was ended.

Aboukir Bay is situated about fifteen miles north-east of Alexandria and is about fifteen miles wide, extending from Aboukir Point on its westerly side to the Rosetta mouth of the Nile. The bay was silted up and its western curve offered exactly the sort of refuge de Brueys, the French Admiral, was seeking for the protection of his fleet which consisted of nine seventy-fours, three eighties, "L'Orient" of 120 guns, and four frigates. He had hoped to station this fleet in such a manner that it would be impossible for an attacking enemy to do more than fight him from seawards. The curving shoals seemed to offer him such a position, and he had drawn up his fleet facing north and north-west in a very obtuse angle, with his own ship, "L'Orient," at the apex, and the ships at the extremities of the line close to the shallows. The frigates he placed between this line and the shoals. So certain was de Brueys that this arrangement would prevent the British getting between him and the land that his ships were not even prepared for action on the landward side. An ordinary attack on his seaward side would, he thought, favour him, since the enemy would be under sail and, further, he had prepared batteries ashore which would enfilade their position. To Nelson's experienced eye, however, a weakness in these dispositions was at once apparent. The French ships were anchored in such a manner that there was nothing to prevent them swinging, and, as Nelson himself put it, "where there is room for a Frenchman to swing, there is room for a Briton to anchor"; in other words it would, for all de Brueys's care, be possible to attack the French on the landward side, either by cutting in between the leading ship and the shoals, or by breaking through between two ships. The British fleet was approaching from the

north with the wind a little west of north, so that there was nothing to prevent their doing either or both. Nelson's orders were that part of the fleet was to get to landward of the enemy and part was to remain to seaward; the northern end of the line was to be attacked first and the English ships were to anchor only by the stern so that, by merely paying out cable, they would be able, as each French ship was demolished, to move on to deal with others which would, owing to the direction of the wind, have found it impossible to come to the assistance of those attacked first.

It was nearly dark when Captain Foley, of the "Goliath," leading the English line, took his ship between the "Guerrier," the leading French ship, and the shore. Raking the "Guerrier" in passing, he went on to anchor on the port quarter of the next French ship, the "Conquerant." Captain Hood, who followed, in the "Zealous," anchored on the port bow of the "Guerrier." The three following ships, the "Audacious," the "Theseus" and the "Orion" broke through the French line and took up positions between the enemy and the shoals. Next came Nelson, in the "Vanguard," and his was the first ship to take up her station to seaward, anchoring opposite the "Spartiate," the third French ship, which was already receiving the attentions of the "Theseus" on the other side and was thus doomed to an eventual surrender. All the remaining ships took up their positions to seaward of the French, with the exception of the "Majestic" and the "Alexander," which broke through, and of the "Culloden," commanded by Nelson's friend, Troubridge, which was unfortunate enough to run ashore on a projecting sandbank before getting into action. Even this was not without its blessings, since, by hanging out signal lights, Troubridge was able to warn the ships following against suffering a similar fate, and they all escaped it. The enormous "Orient" was engaged first by the "Bellerophon" and then by the "Swiftsure" and "Alexander," which were the last ships into action, one on each side of her. The French flagship fought stubbornly, but she was set on fire and at ten o'clock blew up with a colossal explosion. Surrenders to the British were now becoming frequent, and as each ship was taken, the victors were able to move on and engage others which, no doubt mystified and confused in the darkness, were complacent enough to wait their turn. In this way the entire French fleet was accounted for with the exceptions of the two rear battleships and two frigates which made off in time; it is interesting to note that they were all taken or destroyed in subsequent actions. The victory of the Nile was one of the most complete in the annals of naval history, and was rich in results. It enabled England to capture Minorca and Malta; it completely restored her position and prestige in the Mediterranean; and this, in turn, enabled Pitt to conclude successfully his negotiations for the formation of a new coalition.

See Southey, *Life of Nelson*, ed. G. A. R. Callender (1922, bibl.). (G. A. R. C.; J. G. B.)

NILES, a city of Berrien county, Michigan, U.S.A., 93 m. E. of Chicago, on the St. Joseph river. It is on Federal highway 31; has a municipal airport; and is served by the Big Four and the Michigan Central railways, and by interurban trolley and motorbus lines. The population was 7,311 in 1920, 90% native white, and was estimated locally at 12,500 in 1928. It is the shipping and trading point of a rich farming and dairying region; has a mushroom industry which supplies most of the markets of the Middle West; and is an important manufacturing centre, with numerous and diversified industries. The Michigan Central railroad has its largest classification yards here, as well as repair shops and roundhouses. On or near the site of Niles French Jesuits established a mission in 1690, and the French government in 1697 erected Ft. St. Joseph, which was captured from the English by the Indians in 1763 and in 1781 was seized by a Spanish party from Saint Louis. The present city was founded in 1826 and incorporated in 1859.

NILES, a city of Trumbull county, Ohio, U.S.A., on the Mahoning river, 10 m. above Youngstown; served by the Baltimore and Ohio, the Erie and the Pennsylvania railways. Pop. 13,080 in 1920 (25% foreign-born white); estimated locally at 20,000 in 1928. It is an important industrial centre, manufacturing especially steel sheets, glass and fire-brick, with a factory output in 1925 valued at \$25,263,634. Niles was settled in 1832, incorpo-

ated as a village in 1865 and chartered as a city in 1895. It was named (1834) after Hezekiah Niles (1777-1839), founder and editor of *Niles's Register* (1811-49); and was the birthplace of President McKinley, to whose memory a memorial has been erected.

NILGAI ("blue bull"), the largest antelope (*Boselaphus tragocamelus*) found in India, where it represents the kudu and eland group of Africa. Only the bulls have horns, and these are short. The general colour of old bulls is bluish-grey, but younger bulls and cows are browner. It is about the size of a mule (see ANTELOPE).

NILGIRIS, THE (Blue Mountains), a system of hills in southern India, which gives its name to a district of the Madras Presidency. The Nilgiris form a plateau rather than a range, rising abruptly from the plains on most sides, with a general elevation about 6,500 ft. above sea-level.

The DISTRICT OF THE NILGIRIS is the smallest administrative district in Madras. It was formerly confined to the plateau, but was increased by the addition of portions of the Wynnad, making a total area of 982 sq.m. The administrative headquarters are at Ootacamund (q.v.). There is an abrupt descent of about 6,000 ft. from the plateau to the plains, save on the north, where the base of the mountains rests upon the elevated land of Wynnad, and Mysore, standing between 2,000 and 3,000 ft. above sea-level. The Ochterlony valley and Wynnad country consist of a series of broken valleys, once forest-clad throughout, but now studded with tea and coffee-gardens. The highest peak is Dodabetta, 8,760 ft. There are six well-known passes or *ghats* by which the district communicates with the neighbouring plains, three of which are practicable for wheeled traffic. The chief rivers are the Moyar, Paikara and Calicut, none of which is navigable. The forests consist of fine timber trees, and eucalyptus and Australian wattle have been extensively planted in the higher grounds of the Wynnad. Large game animals of many kinds are numerous. The hill tribes include Todas, Badagas and Kotas. The population of the district in 1921 was 126,519. The commercially important products are coffee, tea and cinchona. The latter is cultivated by the government, and also in private gardens, and there is a government quinine factory. The climate of the Nilgiri hills is extremely equable. A branch of the Madras railway runs from Podanur to Mettupalaiyam, whence a metre-gauge line on the rack principle goes to Coonoor, where there is a silk-farm, and Ootacamund. The Lawrence Memorial School at Ootacamund is maintained by government. The military quarters are at Wellington.

NILOTES, certain peoples of the Anglo-Egyptian Sudan, of whom the Shilluk and Dinka, best known representatives of these tall "black"-skinned dolichocephals, have an average stature of about 1.78m. (about 70in.) or perhaps a little more, and a cephalic index which varies around 72. In these tribes, as well as in the Nuer and Anuak, there is an Hamitic element, and although the majority have coarse features, with broad noses, among the Shilluk and probably the Anuak men with shapely features, including thin lips, long, relatively high-bridged, narrow noses, and well modelled foreheads are not uncommon.

The languages of the Nilotes form a sub-group of the family of languages called by Meinhof "Sudanic," characterized by the absence of inflection and grammatical gender and by the use of tone rather than accent, while typically each word consists of one syllable (see AFRICAN LANGUAGES). Shilluk so closely resembles Anuak that the two peoples can understand one another, and the same probably holds for Dinka and Nuer.

Mode of Life.—The Nilotes are essentially pastoral and largely riverain, their interest in their cattle being so far predominant that they usually grow scarcely enough grain to supply themselves till the next harvest. For the most part the men go absolutely naked, the women wear a pair of leather aprons reaching from waist to knee. The forehead is often scarred, and the lower incisors are generally removed. The skin is commonly smeared with the ash of wood and cattle dung. Ivory armlets are worn and the hair may be worked into elaborate head-dresses. Cannibalism is unknown and human sacrifice is almost entirely absent. The number of cattle constituting the bride price is a matter of

great importance, and this is usually paid in instalments. Certain iron-making groups of Dinka living near the Nile-Congo Divide, having few or no cattle, pay for their wives in iron. Widows are inherited by their husband's heirs, the children that they bear being counted as children of the first husband. Psychically the Nilotes, especially the Dinka, are distinguished from all other groups in their extreme aloofness and pride of race, showing absolutely no desire for European clothes or trade objects.

The social organization of the Shilluk is into a number of exogamous groups, but whether these are totemistic must be left for future investigation. Among the Dinka, who consist of a congeries of independent tribes, there are typical totemistic clans with descent in the male line, the totem being an animal, plant or even a natural object such as a meteor or fire. Almost all the clans whose totem is an animal derive their origin not from the animal itself but from a man born as one of twins, his fellow twin being an animal of the totem species, though sometimes the association is not quite so close, as when the totem animal lays certain commands upon members, offering in return certain privileges.

Religion.—Among the Dinka and Shilluk, the only two Nilotic tribes of whose religious ideas there is definite knowledge, the king (Shilluk *ret*) or chief (Dinka *bain*) is the rain-maker and belongs to the class of rulers called by Sir James Frazer Divine Kings, *i.e.*, there is immanent in each a divine spirit upon which depends the fertility and well-being of the universe. Such divine kings are not allowed to go to battle and were formerly killed ceremonially with their own consent when they showed signs of ill-health, or sometimes even of diminishing strength, lest the decline in vigour of their body—the living shrine of the divine spirit—should entail the weakness of the latter, when the cattle would sicken and fail to bear their increase, the crops would rot in the fields, and men, stricken by disease, would die in ever increasing numbers. The Shilluk king is indeed the classical example of the divine king, and two stages of his treatment can be traced; the earlier, preserved alone in folklore, refers to a time when anyone could kill the king and become his successor until he in turn was killed by a stronger, while in more recent times the killing of the king has become a ceremonial affair, the leading part being assigned to certain families called the Ororo.

In the case of the Shilluk the divine spirit incarnate in each king is *Nyakang*, the historic founder of the Shilluk kingdom and their culture hero. Like so many divine or semi-divine characters he did not die but vanished in a great storm. He has ten cenotaph tombs, the most sacred perhaps being that of Fenikang, the village in which he lived for a great part of his life. It is the presence of the divine spirit of *Nyakang* in the ruling king which enables the latter to move the High God, Juok, to send rain.

See W. Hofmeyer, *Die Shilluk* (1925); C. G. Seligman, "The Cult of Nyanking," *Fourth Report of the Wellcome Laboratory*, 1911, Vol. B. (C. G. S.)

NILSSON, CHRISTINE (1843–1921), Swedish singer, was born at Wederslöff, near Wexjö, Sweden, on Aug. 20, 1843, of poor parents. She studied in Paris, where she made her début in the rôle of Violetta at the Théâtre Lyrique on Oct. 27, 1864. Between that date and 1872, when she married M. Auguste Rouzaud, she was the leading prima donna. Her first appearance in London was in 1867. A year later, on the 9th of March, she made her first appearance in the Paris Opera House as Ophélie in *Hamlet*; and she visited the United States in 1870. After her marriage her appearances in public were rare. After her second marriage in 1887, with Count A. de Casa Miranda, she retired from the stage.

Madame Nilsson died at Copenhagen on Nov. 22, 1921.

NIMBUS: see AUREOLA.

NÎMES, a city of southern France, capital of the department of Gard, 174 m. S. by W. of Lyons on the P.L.M. railway,

between Avignon and Montpellier. Pop. (1926) 74,102.

Nîmes, the ancient *Nemausus*, was named from the sacred wood in which the Volcae Arecomici (who surrendered to Rome in 121 B.C.) held their assemblies. Strabo states that it was the metropolis of a district containing 24 dependent towns, and that it was independent of the proconsuls of Gallia Narbonensis. Constituted a colony of veterans by Augustus, and endowed with numerous privileges, it built a temple and struck a medal in honour of its founder. The medal, which afterwards furnished the type for the coat of arms granted to the town by Francis I., bears on one side the heads of Caesar Augustus and Vipsanius Agrippa (the former crowned with laurel), while on the other there is a crocodile chained to a palm-tree, with the legend COL. NEM. Agrippa built the public baths, the temple of Diana and the aqueduct of the Pont du Gard. The city-walls, erected by Augustus, were nearly 4 m. in circuit, 30 ft. high and 10 ft. broad, flanked by 90 towers and pierced by ten gates. Hadrian on his way back from Britain erected at Nîmes two memorials of his benefactress Plotina. In the very height of its prosperity the city was ravaged by the Vandals; the Visigoths followed, and turned the amphitheatre into a stronghold, which at a later date was set on fire along with the gates of the city when Charles Martel drove out the Saracens. Nîmes became a republic under the protection of Pippin the Short; and in 1185 it passed to the counts of Toulouse, who enclosed it with ramparts, less extensive than that of Augustus, still to be traced in the boulevards. The city took part in the crusade against the Albigenses in 1207. Under Louis VIII. it received a royal garrison into its amphitheatre; under Louis XI. it was captured by the duke of Burgundy, and in 1420 was recovered by the dauphin (Charles VII.). On a visit to Nîmes Francis I. enriched it with a university and a school of arts. By 1558 about three-fourths of the inhabitants had become Protestants, and in 1567 a massacre of Catholics took place on St. Michael's day. From the accession of Henry IV. till the revocation of the edict of Nantes (1685) the Protestant community devoted itself to active industry; but after that disastrous event great numbers went into exile or joined the Camisards. Louis XIV. built a fortress (1687) to keep in check the disturbances caused by the rival religious parties. Nîmes passed unhurt through the storms of the Revolution; but in 1815 Treillaillon and his bandit followers pillaged and burned and plundered and massacred the Bonapartists and Protestants.

Nîmes lies at the foot of the Garrigues, a range of barren hills on the north and west. The most prominent of these is the Mont Cavalier, on the summit of which is the Tour Magne, a ruined Roman tower. To the south and east the town overlooks the plain of the Vistre, largely used for the vine. The central and oldest part of the town consists of low buildings and is encircled by boulevards, which occupy the site of the old fortifications. Here are to be found the majority of the Roman remains for which Nîmes is remarkable. The most celebrated is the amphitheatre, the best preserved in France. It dates from the 1st or 2nd century A.D. and was used as a fortress for some time during succeeding centuries. Occupied during the middle ages by a special quarter, with a church, it was cleared in 1809. It is built of large stones fitted together without mortar. In form it is elliptical, measuring approximately 440 by 336 ft. externally; the arena is 227 by 126½ feet. The elevation (70 ft. in all) consists of a ground story of 60 arches, an upper story of 60 arches and an attic with consoles pierced with holes for supporting the *velarium* or awning. The building, which was capable of holding nearly 24,000 persons, has four main gates, one at each of the cardinal points; and 124 doorways gave exit from the 35 tiers of the amphitheatre to the inner galleries. Originally designed for gladiatorial shows, naval spectacles, chariot races, wolf or boar hunts, the arena has in recent times been used for bull-fights. The celebrated Maison Carrée, a Roman temple 82 ft. long by 40 wide, is a famous monument, and according to an inscription is dedicated to Gaius and Lucius Caesar, adopted sons of Augustus, and dates from the beginning of the Christian era. It contains a collection of antique sculptures and coins. The so-called temple of Diana, which adjoins the Fountain

A YOUNG DINKA WOMAN

gardens, was probably connected with the baths of which remains are visible near by. Two Roman gates, the *Porte d'Auguste*, consisting of two large archways flanked by two smaller ones and dating from A.D. 16, and the *Porte de France* remain. The *Tour Magne* (*Turris Magna*) is still 92 ft. in height, and was formerly higher. It is the oldest monument of Nîmes, but its use is not clear. It was turned into a fortress in the middle ages by the counts of Toulouse. Near the *Tour Magne* has been discovered the reservoir from which the water brought by the *Pont du Gard* (see *AQUEDUCT*) was distributed throughout the city.

With its capital, the temple of Augustus, the basilica of Plotina erected under Hadrian, the temple of Apollo, the baths, the theatre, the circus, constructed in the reign of Nero, the *Campus Martius* and the fortifications built by Augustus, Nîmes must have been one of the richest of the Roman cities of Gaul. The cathedral (*St. Castor*), occupying, it is believed, the site of the temple of Augustus, is partly Romanesque and partly Gothic in style. The churches of *St. Paul* and *St. Baudile* are modern. The *Fountain gardens* owe their name to a spring of water which fluctuates considerably in volume, and discharges into the *Vistre*; the town water comes from the *Rhone*. *Alphonse Daudet* and the *Provençal* poet *Jean Reboul* were natives of the town.

The city is the seat of a bishop under the archbishop of Avignon, a prefect, a court of appeal and a court of assizes, and has tribunals of first instance and of commerce, a board of trade-arbitrators and a chamber of commerce. At the close of the middle ages the industries of Nîmes received an impetus from a colony from Lombardy and Tuscany, and maintained their importance, so that before the Revolution about half of the whole community were engaged in manufactures, chiefly that of silk. Upholstery materials, shawls, carpets, handkerchiefs, tapes and braidings, brandy, hosiery, leather, clothes, candles, machinery and boots and shoes are now manufactured, and there are a number of foundries. Nîmes is, besides, a great market for wine and brandy, and there is a good trade in grain, groceries and colonial wares. Quarries of hard limestone, used for the amphitheatre and other Roman buildings, are still worked in the vicinity.

NIMROD is described in *Genesis* x. 8-12 as the first "to be a mighty one in the earth," which Skinner in his commentary paraphrases as "originator of the idea of the military state, based on arbitrary force." Apart from *1 Chron.* i. 10, which quotes this description, the only other reference to Nimrod in the Old Testament is *Micah* v. 6, where Assyria is called the land of Nimrod. Unlike the other names in the *Genesis* context, which are names of peoples, Nimrod is that of an individual. He is a son of Cush, which cannot mean, as it usually does, Ethiopia, but possibly stands here for the *Kashshu*, a people who conquered Babylon in the 18th century B.C. The beginning of Nimrod's kingdom is said to be Babel, Erech, Accad and Calneh, in the land of Shinar. Babel is Babylon; Erech, a city of Babylonia, is the present-day Warka; Accad, "Agade," the royal city of Sargon I., was the capital of a district of the same name in N. Mesopotamia; Calneh is unknown. Shinar, which the O.T. sometimes identifies with Babylonia, was, as Egyptian and Hittite records show, a distinct country, probably in N. Mesopotamia, which was prominent 1500-1200 B.C. Nimrod is said to have built Nineveh, Calah, an Old Assyrian town on the left bank of the Tigris, south of Nineveh, Rehoboth-Ir and Resen, both of which are unknown. It is in accordance with historical truth that Assyria was developed from Babylonia. The description of Nimrod as a "mighty hunter before the Lord," that is, a supreme hero of the chase, is an intrusion in this context, but probably, like the historical notices, derived from some old Babylonian saga. The Assyrian kings were noted for their prowess in hunting. But though we may feel reasonably sure that the Nimrod traditions were derived from Babylonian sources no equivalent of the name has yet been found in the cuneiform records. In character there is a certain resemblance between Nimrod and the hero Gilgamesh. Jensen, and later, with some hesitation, Jirku, suggested that the name *NIN-IB* of a Babylonian god might be read phonetically *Namurtu*, and compared with Nimrod. But Clay (*The Origin of Biblical Traditions*, p. 22 seq.) seems to have demonstrated that

the correct reading is *Nin-martu*. Meyer points out that the name Nimrod is common in Libya, but his theory that the saga was originally Libyan, and came to Israel via Egypt, seems very improbable. (W. L. W.)

NINEBARK (*Physocarpus opulifolius*), a North American shrub of the rose family (Rosaceae), native from Quebec to Manitoba, south to Georgia and Kansas, and commonly planted for ornament. It grows from 5 to 10 ft. high, with strong, recurving stems, exfoliating bark and small, white or pinkish flowers, in umbel-like clusters, followed by conspicuous, inflated, reddish pods.

NINEVEH. The ancient capital of the Assyrian empire lay on the right bank of the Tigris opposite the modern city of Mosul. It consists of two great mounds, *Kouyunjik* and that on which to-day is the reputed tomb of the prophet *Jonah* (*Nebi Yunus*). The river has now shifted a short distance to the west so that the mounds are isolated from the present bed, although in ancient times the city abutted on the river. The city is situated on the north west corner of a plain about 25 by 15 miles in extent, formed by the Tigris and its tributaries, the *Khosr* on which Nineveh was built, which bounds the plain on the northwest, the *Gomal*, which forms the northeastern boundary, and the *Upper Zab* on the southeast. The western and south flank is protected by the Tigris itself. The whole plain slopes gently to the Tigris and provides a strong position, being protected by the foothills and the *Gomal* on the northeastern side, and on the south and west by the Tigris and the *Upper Zab*. The *Khosr*, although impassable enough when flooded forms at other times no barrier to attack. The position of Nineveh therefore astride this stream at its confluence with the Tigris is of great strategic importance. The *Khosr* was used to supply water to fill the protective works of the city and elaborate measures of river conservancy were taken to protect the plain against its most destructive inundations. Although the country is a fertile and prosperous wheat growing land, a fact which no doubt accounts for the many ancient cities so close to one another, owing to the slope of the plain the city itself is badly supplied with water and Sennacherib was compelled to build water conduits to conduct water from the hills into the *Khosr* and its canal system. The city then, although formerly, as is its modern descendant Mosul, the centre of a rich district, was suited particularly to military efficiency.

The city itself was surrounded by immense walls, which enclosed an irregularly shaped space, about three miles long and about a mile broad at the north where the walls were double, narrowing to about three quarters of a mile at the southern end. The walls were pierced by fifteen gates. As in so many walled cities the actual dwellings did not occupy the whole of the space within the walls, there were parks watered by the elaborate aqueducts which brought water from the *Khosr* and other open spaces. The two great mounds formed two great fortified strongholds, and were joined together by a wall, part of which formed the west wall of the city. The mound of *Kouyunjik*, which is at present being explored by Campbell Thompson on behalf of the British Museum, contains an important series of buildings. On the north lay the palace of *Ashur-banipal*. South of this lay the Temple of *Nabu*. On this spot a great rectangular building was found, 100 × 80 feet which probably included part of the temple buildings and of the courtyard. Directly south of this again is to-day a broad pit which may possibly represent the site of the temple of *Ishtar* which is known to have existed on the mound. To the east is a building of Sennacherib, whose purpose does not seem to have been identified. Finally at the southwestern extremity of the mound is the palace of Sennacherib. This palace is of great architectural magnificence and is especially remarkable for the bas-reliefs which have so far been discovered. On the other mound Sennacherib built a military depot; his son *Esar-Haddon* built himself a palace on this mound, which has not at present been fully explored.

Although the greatness of Nineveh covers a comparatively short period there are indications that the city was Sumerian in origin, and early pottery and obsidian flakes have been found on the site. It has been suggested that possibly the Sumerians occupied this whole area before migrating south. The true history of Nine-

veh however begins at a comparatively late date. Hammurabi restored a temple of Ishtar, probably in Nineveh and Shalmaneser I., nearly a thousand years later, about 1300 B.C. restored the temple again, but although Sennacherib states that some of his ancestors were buried there the city was small and unimportant. He built the great building and walls which have already been described and made a great triumphal way. His son Esar-Haddon rebuilt the temple of Ashur but started to rebuild Babylon, and did not carry out Sennacherib's purpose of making Nineveh the capital city of the Assyrian empire. Ashur-banipal however enriched the city with some of its greatest treasures, including a great library of clay tablets. Finally in 612 B.C. the men of Nineveh were defeated by the Medes and the city was looted and destroyed.

It seems probable that Mespila, referred to by Xenophon in the *Anabasis* refers to this site, and if so the spot was deserted at this time, but the name of Nineveh was applied to the site even in the middle ages, so an ancient tradition must have existed as to the location of the town. The site however did not become of any importance again till the time of the Arab conquest, when it lay on the opposite bank of the Tigris. (For later history see MOSUL.) The site has been attacked by numerous excavators from Layard onwards. In 1903-5 it was excavated by L. W. King and R. Campbell Thompson.

NINGPO ("City of the peaceful waves"), an important Chinese city and chief commercial centre of the province of Chekiang, lying in a fertile plain backed by mountains on the south side of Hangchow Bay, and about 16 miles upstream from the mouth of the Whangpoo. The district of Ningpo, covering an area of 66 square *li* has a population of about 680,000, of whom 212,397, according to a recent census (1928), live in the city. The city is of great antiquity and has occupied its present site since A.D. 713. It was one of the earliest centres of European settlement in China, the Portuguese arriving there about 1520. The early colony, known as Liampo, flourished until 1545, when the traders, owing to their illegalities, were driven out by the Chinese. Subsequent regulations and restrictions made foreign trade with Ningpo virtually impossible. In 1840 British war-vessels blockaded Ningpo and the following year, after the fall of Chinhai, a fortified town at the mouth of the Whangpoo, it was entered without resistance. In 1842, by the Treaty of Nanking, Ningpo was opened to foreign trade, and the question then arose as to whether Shanghai or Ningpo should become the commercial metropolis at the mouth of the Whangpoo. Shanghai assumed that rank and since then has impeded the growth of Ningpo's trade. The opening of Wuhu (1877) and Hangchow (1896) also contributed to the diversion of this trade. Since the War, however, it has increased considerably; the total value, in millions of Haikwan taels, rising from 34.4 in 1921 to 44.9 in 1924.

	Haikwan taels
1926: Net foreign imports	20,270,580
Net Chinese imports	14,000,331
Exports	16,205,494
Total	50,566,405

These figures show an apparently unfavourable trade balance, but the regular remittances of numerous natives of Ningpo in business at Shanghai and elsewhere, more than counterbalance the trade deficit. Ningpo is the port of shipment for cotton grown in the neighbouring districts; the annual export to Shanghai amounting to about 180,000 bales, for native drugs, tea, and more especially, fish and fish products. It has about 1,500 "couples" of junks engaged in the sea-fisheries around the Chusan archipelago and supplies large numbers of fishermen. Ningpo is also noted for its grass mats, made of reed or grass grown locally. These mats find a market even in Japan, despite keen competition, owing to their cheapness. Rush is also specially grown and made

into braids for straw hats, while laces are knitted in the neighbourhood and shipped chiefly to Shanghai. On the import side, Shanghai supplies Ningpo with considerable quantities of cotton yarn and cotton piece-goods. There are also large imports of kerosene oil and drugs. The total value of the sugar trade of Ningpo is approximately \$1,500,000 a year; 70% of the sugar comes from foreign sources and the remainder from Fukien province.

Inland waterway communication in the vicinity of the city is provided by the Whangpoo and Fenghwa-kiang, as well as by canals. There is a daily steamer service to Shanghai, and regular sailings to Chusan and as far afield as Wenchow. Railway-connection with Hangchow, the capital of Chekiang province and 160 miles distant, is not yet complete, the railway from Ningpo running as far as Tsao-o. The chief crops in the district, in order of importance, are rice, beans, wheat, cotton, rush and reed.

Various modern manufacturing industries have been established in the city. Of the cotton-mills the Ho Fêng is the largest, drawing the bulk of its raw cotton supply from the neighbouring district of Yuyao. Its yarns are sold chiefly on the local market or elsewhere in Chekiang. About 1,000 looms in small factories and households produce each year 30-40,000 pieces of silk, the bulk of which is dyed in Shanghai. There are, in addition, electrical supplies, hardware, knitting and sewing companies, candle, soap, and canning factories, and numerous tin-foil makers.

The city, set amid pleasant surroundings, is encircled by a fine old wall, containing six gates, and from 4-5 miles in length. Among its most prominent features are the numerous tall ice-houses, the picturesque T'ien-fêng-t'a or Ningpo pagoda, a tall white tower rising to a height of 160 feet, and the Drum Tower, many centuries old. The city has long been famous as a centre of learning and religion, and numerous temples, monasteries and colleges are representative of old Ningpo.

NINIAN, ST., a Briton, probably from Strathclyde, who was trained at Rome and founded a church at Whithorn on the west side of Wigtown Bay. Whithorn has been identified with the Leukopibia of Ptolemy, but this is uncertain. Bede, writing three centuries after Ninian, ascribes the name Ad Candidam Casam to the fact that the church of Ninian was built of stone. We are told by Bede that St. Ninian dedicated his church to St. Martin of Tours, who died between 397 and 400, but Ailred of Rievaulx is our only authority for the statement that St. Martin supplied him with masons. The legends of his work in Ireland probably arise from the influence exercised in that country by the church of Whithorn. The date of Ninian's death is given by Archbishop Ussher as 432, but there is no authority for this statement.

See Bede, *Hist. Eccl.* (ed. C. Plummer, Oxford, 1896), iii., iv.; Ailred of Rievaulx, "Life of St. Ninian," in the *Historians of Scotland* vol. v. (Edinburgh, 1874); W. F. Skene, *Celtic Scotland* (Edinburgh, 1877), vol. ii. 2 ff.; J. Rhys, *Celtic Britain* (London, 1904), p. 173; and A. B. Scott, *S. Ninian, Apostle of the Britons and the Picts* (1916).

NIOBE, in Greek mythology, daughter of Tantalus and Dione, wife of Amphion, king of Thebes. Proud of her sons and daughters (numbers variously given by different authors), she boasted of her superiority over Leto, the mother of only two children, Apollo and Artemis. As a punishment, Apollo slew her sons and Artemis her daughters. Their bodies lay for nine days unburied, for Zeus had changed the people to stone; on the tenth day they were buried by the gods. Out of pity for her grief, the gods changed Niobe herself into a rock on Mt. Sipylus in Phrygia, in which form she continued to weep (Homer, *Iliad*, xxiv. 602-617; Apollodorus iii. 5; Ovid, *Metam.* vi. 146-312). This "Niobe," described by Pausanias (i. 21) and Quintus Smyrnaeus (i. 293-306), both natives of the district, was the appearance assumed by a cliff on Sipylus when seen from a distance and from the proper point of view (see Jebb on Sophocles, *Antigone*, 831). It is to be distinguished from an archaic figure still visible, carved in the northern side of the mountain near Magnesia, to which tradition has given the name of Niobe, but which is really intended for Cybele.

The tragic story of Niobe was a favourite subject in literature and art. Aeschylus and Sophocles wrote tragedies upon it; Ovid has described it at length in his *Metamorphoses*. In art, the most

famous representation was a marble group of Niobe and her children, taken by Sosius to Rome and set up in the temple of Apollo Sosianus (Pliny, *Nat. Hist.* xxxvi. 4). What is probably a Roman imitation of this work was found in 1583 near the Lateran, and is now in the Uffizi gallery at Florence.

BIBLIOGRAPHY.—C. B. Stark, *Niobe und die Niobiden* (1863), the standard work; for the Niobe on Mount Sipylus, see J. G. Frazer, *Commentary on Pausanias*, iii. 555; for vase-paintings, see H. Heydemann, *Niobe und Niobiden auf griechischen Vasenbildern* (1875); in general, Enmann in Roscher's *Lexikon s.v.* (bibl.); Sauer, *ibid.* (Niobe in art).

NIOBIUM, a metal which occurs associated with tantalum (*q.v.*) in the rare mineral tantalite or columbite. It was given this name (from Niobe, the daughter of Tantalus) by H. Rose (1846), but is now usually called *columbium* (*q.v.*).

NIORT, a city of France, chief town of the department of Deux-Sèvres, 42 m. E.N.E. of La Rochelle by rail to Saumur. Pop. (1926) 23,121. Up to the 7th century the Niort plain formed part of the Gulf of Poitou; and the mouth of the Sèvre lay at the foot of the hills now occupied by the town which grew up round the castle erected by Henry Plantagenet in 1155. The place was captured by Louis VIII. in 1224. By the peace of Brétigny it was ceded to the English; but its inhabitants revolted against the Black Prince, and most of them were massacred when his troops recovered the town by assault. In 1373 the French regained the town. Protestantism made numerous proselytes at Niort, and Gaspard de Coligny made himself master of the town, which successfully resisted the Catholic forces after the battle of Jarnac, but surrendered without striking a blow after that of Moncontour. Henry IV. rescued it from the League. It suffered severely by the revocation of the edict of Nantes. Niort is on the Sèvre Niortaise. The tower of the church of Notre-Dame (15th and 16th centuries) has a fine stone spire and a north doorway with a carved balustrade. The donjon of the old castle remains. The old Renaissance hôtel-de-ville contains a collection of antiquities. Near Niort are the feudal ruins of the fortress of Coudray-Salbart. Niort is the seat of a prefect and a court of assizes. Tanning, currying, shammy-dressing, glove-making and the manufacture of brushes and boots are the staple industries.

NIPIGON, a lake and river of Thunder Bay district, Ontario, Canada. The lake is 30 m. N. of the bay of the same name on Lake Superior, at an altitude of 852 ft. above the sea. It is 70 m. long and 50 m. wide; contains over 1,000 islands, is very deep, and has a much-indented shore-line measuring upwards of 580 m. The river, which drains the lake, descends 250 feet in the 40 m. of its course and is the largest stream flowing into Lake Superior. It is widely known for its trout fishing.

NIPISSING, a lake of the district of the same name in Ontario, Canada, situated nearly midway between Lake Huron and the Ottawa river, at an altitude of 644 ft. above the sea. It is of irregular shape, with bold shores, and contains many islands; from the north it receives the waters of Sturgeon river. It is 50 m. in length and 20 in breadth; discharges its waters by French river into Lake Huron, and is separated by a low watershed from the Mattawa river, a tributary of the Ottawa. It has been proposed as the summit level of the projected Ottawa and Georgian Bay canal. With the Ottawa, Mattawa and French rivers it formed the old *voyageur* route from Montreal to the Great Lakes.

NIPPON GINKO (Bank of Japan) was established in 1882 as a joint-stock company and its authorised capital, which was at first 10,000,000 yen was increased three times, in 1927 standing at Y 60,000,000 of which Y 37,500,000 has been paid up.

The Bank of Japan has the privilege of issuing bank-notes against gold and silver coins and bullion and, further of issuing such notes on the security of Government bonds and Treasury bills and other bonds and commercial bills of a reliable nature. One maximum amount allowed to cover the latter style of notes is Y120,000,000. In case of necessity, the Bank may be given authority to issue notes beyond this maximum. If such notes are issued they are subject to a tax of not less than 5% per annum.

The Bank is principally concerned with business of the following types: the discount or purchase of government bills, bills of exchange and commercial bills; the buying or selling of gold and

silver bullion; the making of loans on security of gold and silver coins and bullion; the collecting of bills for banks, companies and merchants, who are its regular customers; the receiving of deposits and the acceptance of the custody of articles of value, such as gold, silver, other precious metals and documents, and the making of advances to current accounts, or loans for fixed periods on security of Government bonds, Treasury bills and other bonds guaranteed by the Government. The Bank also manages the receipts and disbursements of the Treasury. The issue of notes in 1926 reached the figure of Y1,631,783,959. (S. YA.)

NIPPON YUSEN KAISHA (Japan Mail Steamship Company Ltd.). The N.Y.K. was founded in 1885, having as its nucleus the Mitsubishi Company, established by the late Mr. Yataro Iwasaki in 1871. When complaints were uttered against the Mitsubishi Company, the *Kyodo Unyu Kaisha* (Union Transport Company) began, in 1882, a competition with it. This struggle became so acute that in 1885 the two were united in the Nippon Yusen Kaisha.

The new Company, maintaining the old services, opened new lines to Korea and north China as well as one between Shanghai and Vladivostok. In 1891 the Company inaugurated a service between Kobe and Manila and began sending steamers to Australia; in the following year the Japan to Bombay Service was opened, this constituting the first regular Japanese Steamship service with a distant overseas country. In 1896 three main services were inaugurated (1) the Yokohama-London-Antwerp line; (2) the Hong Kong-Japan-Seattle line and (3) the Yokohama-Manila-Australia line; the first two were fortnightly and the last-mentioned four-weekly. The company's capital was increased to double the previous amount, viz., 22,000,000 yen. In 1905 the Company owned 73 steamers, gross tonnage 250,100. In 1915 the number had risen to 93 steamers with a gross tonnage of over 428,000 tons gross, and the capital of the Company was increased to Y44,000,000.

In the period 1914-1918 further regular lines (*e.g.*, Japan-Liverpool Line, Japan-Java-Calcutta Line, Calcutta-New York Line, Japan-Calcutta-Seattle Line, South Sea Islands Line, etc.). In 1917, the Company's reserves grew to Y77,000,000, its fleet was 99 vessels (453,000 tons gross), and the share capital was increased to Y100,000,000. A noteworthy addition to the Company's fleet was the s.s. "Nagasaki Maru" followed by the sister ship the s.s. "Shanghai Maru" (1922).

In March 1923 the Company separated the near sea services by the formation of the *Kinkai Yusen Kaisha* (Near Seas Mail S.S. Company) and in May 1926, the N.Y.K. absorbed the two services of the *Toyo Kisen Kaisha* (Pacific S.S. Company) running between Japan and San Francisco, China and Valparaiso; and the N.Y.K. increased its capital to Y106,250,000 (paid up Y64,250,000). With the completion of the new motor vessels under construction in 1928 the company's fleet will consist of 152 vessels with a gross tonnage of 886,000. (J. BLA.)

NIPPUR, an ancient sacred city of Mesopotamia. Nippur lay on the bank of the old course of the Euphrates in 32° N., 45° E. The old bed of the river is represented by present Shatt al Nil, whose dry bed now separates the two main groups of ruins. The city lies in the very heart of Sumeria, between the northern cities of Kish, Cutha and Babylon, to whom it is nearest in position, and the cities of the south. It was the centre of the national cult of the god Enlil, and no doubt owing to its position was the ecclesiastical rival of the southern cities, especially Eridu. The possession of Nippur was an essential for every great dynasty, because the rulers of all the cities throughout the whole of Sumer and Akkad ultimately derived their authority from Enlil, and it is essential in studying the ancient geography of Mesopotamia to remember that the monarchy of the region took its rise from prince-priests, and that even the most powerful monarchs could never afford to separate themselves from the powerful and dominant priesthood. Nippur therefore, although probably never a lay capital, except possibly in later times, throughout its long history always played a very prominent part in Mesopotamian history, and, owing to the passion exercised by the priests for recording every transaction, however minute, on clay tablets, has

left us a most complete record both of its life and of the part which it played in national politics. To-day the wide gap between the two rivers has made the irrigation problem a very difficult one but in ancient times the twin rivers approached one another more closely. The narrow strip between the rivers, scarcely more than thirty miles, could be irrigated by water run from the Euphrates to the Tigris and the land between the Euphrates on which there lay a string of cities and the Tigris was of great agricultural value. Nippur, therefore, apart from its sacred position was a land of great wealth.

The prehistoric city was built on the west bank of the Euphrates, and was grouped about the temple of the earth god. The mound now lies on the east bank of the Shatt al Nil. Extensive remains of cremation have been found in all the earlier pre-Sargonic periods and as a matter of comparison it is interesting to note that in the earliest graves at Ur cremation appears to be a purely ritual survival, and that so far at Kish, even in the earliest graves, no signs of cremation have been found. Painted pottery was also found. In the period of Ur-nina, that is, the end of the fourth millennium B.C., the temple area was enlarged and a great rectangular terrace of plano-convex bricks was built. This terrace extended far beyond the temple area and was large enough to include both the temple and its stage tower (*ziggurat*) at the southern end. There were also store houses, cloisters and priests' rooms on the terrace and a large court north of the temple. This building had an inner court, which was surrounded by thick walls and included rooms in which the temple archives were stored.

The restoration of the original form of the city, especially in later times, is made possible by the discovery of a tablet of the Kassite period, now unfortunately lost, which had upon it a sketch plan of the city. It shows part of the city east of the river and enclosed within its own walls, like the forbidden city of Peking to-day, which lies within its own walls and surrounded by the city itself. This inner city formed an irregular square, with sides about 900 yards long and was surrounded by canals, with quays along the walls. The inner city was itself also divided into two by a canal. The temple enclosure was oriented, its angles pointing towards the cardinal points of the compass. The tower of the pre-Sargonic period was on the north side of the inner court. On the east side, next to the tower, was the temple of Ekur, with its chapels and other buildings.

All the important kings held this temple in great veneration and considered its repair and reconstruction as a very necessary pious duty. Under the Semitic occupation Naram-sin rebuilt the temple and the city walls. His building was partly destroyed by Ur-Engur, whose restoration gave the area the form in which we have it recorded. His terrace of sundried bricks covered an area of about eight acres. The ziggurat at the northwestern edge was approached by an inclined plane on the south-east side and was made of crude bricks faced with burnt bricks, set in bitumen. It contained three stages. The city walls built by Ur-Engur followed the general lines of the walls built by Naram-Sin.

The whole sanctuary was later restored by Ashur-banipal of Assyria in the 7th century. The city had previous to this time been allowed to fall into comparative decay, partly owing to the predominance of Marduk, the god of Babylon, when that city was politically dominant, but it enjoyed a period of renewed splendour under the Kassite dynasty, but this was only a temporary respite. Ashur-banipal's restoration however gave it a form in some ways more magnificent than it had ever enjoyed, his great ziggurat measuring 128×190 feet. This was the end of Nippur's glories.

It gradually fell into decay. In the Seleucid period it became a fortress, and was used as such until the close of the Parthian period, in the middle of the third century A.D. From this time onwards the city ceased to be of any importance. It degenerated into a mere village, while some of the old sacred area was used, as in so many Sumerian cities as a cemetery. In the tenth century A.D. the site again became of some importance as a Jewish settlement, although it is possible that there may have been Jews settled on the site even earlier, possibly at the time of the exile. In the 12th century it was the site of a Christian bishopric.

The condition of the ruins to-day is thus described by Langdon: "They are not so extensive as Kish but more compact and massive. . . . The grandeur of these lofty unbroken lines of mountainous ridges, whose concealed buildings lie deep beneath the plain level, cannot be described to conjure sufficiently the imagination of the reader. They do not belie the fame of Nippur in cuneiform inscriptions."

ANCIENT DOCUMENTS

The excavators of the site were particularly fortunate in the number of ancient documents discovered. The ancient temple library and its archives were not in the temple itself but in a mound to the south. West of the temple there was a commercial and residential quarter, and here, separated from the temple by a canal, were found the important archives of the Kassite kings and business houses of the Neo-Babylonian and Persian periods.

These archives show that the district was a great centre of the cattle industry. Cattle and sheep were driven to Nippur for the different feast days and careful records of every transaction were kept. The details are so full that an issue is recorded of barley porridge to such humble members of the temple staff as the dogs. There were three main sources of revenue for the temple. First there were a series of tolls or dues of various forms. Secondly the temple was a great owner of property and received considerable revenues as rent. Thirdly cattle breeding was carried on. Nippur under the Kassites was an administrative centre, possibly even a capital city. The taxes, which were paid in kind, were either stored here or at the chief city of the district. The record of these taxes is instructive for the side lights thrown on the economic geography of Mesopotamia nearly four thousand years ago. The products which were paid included wheat, sesame, oil, dates, flour and live stock.

The majority of these temple archives of Nippur have been found at Tal Duraihim (Drehem) a city site about six miles south of Nippur, and three miles S.E. of the modern village of Afaj. This city apparently served as the collecting place for the animals used for sacrifices at Nippur. These animals formed part of the taxes payable under the kings of the third dynasty of Ur, and the records are therefore of the greatest value in giving lists of the towns at the time and their assessable value. The ruins of this site to-day consist of a large crescent-shaped mound, some 300 feet from north to south, and 200 feet in width, while the height above the plain is about 40 feet. Langdon is of opinion that whatever the building under this mound may prove to be it is certainly not a temple.

NIRVĀNA, in Buddhist dogmatics, means literally "blowing out," i.e., the blowing out or extinction of the fire of passion in one who attains release. Whether such a person became extinct at death is classed in the Scriptures among the questions which the Buddha refused to answer. The term is probably originally Buddhist, but it is also found in Vedānta to express union with Brahma. (See **BUDDHISM**.)

NISH, the capital of the Nish department of Serbia, Yugoslavia. Pop. (1921) 25,096, comprising Serbs, Turks, Albanians, Bulgars, Greeks and a Jewish colony. Nish is not only important commercially, but also strategically since (1) it commands the only two valleys affording easy access from Central Europe to the Aegean, (2) it is the meeting-point of several of the chief Balkan highways, and (3) it is the junction on the Belgrade-Nish railway for both Sofia and Salonika, and fortunately, in this respect, is within easy reach of good coal supplies. The town is the headquarters of one of the five Serbian army provinces, and is the principal fortress, the perimeter of the entrenched camp being about 30 m. with outlying modern works. The surrounding heights were fortified after 1886. The Turkish town, on the N. bank of the Nishava, contains the citadel and many mosques and

picturesque old houses among its winding alleys. It is connected by three bridges with the more modern Serbian town on the south bank, which has wide, fairly well-paved streets, a royal palace surrounded by gardens, a cathedral, government offices, banks and several trading associations. Here too, are the government railway repairing sheds, factories for trucks, engines and carriages, an iron foundry, a pork factory, steam flour mills and an electric power station. The barracks are outside the town. Nish is the see of a bishop and the seat of a district prefecture and a tribunal.

The ancient Roman city *Naissus*, which probably superseded a Celtic settlement, was mentioned as an important place by Ptolemy of Alexandria, and the old fortress on the right bank of the river is believed to have been erected on its site. Under its walls in A.D. 269 the Emperor Claudius destroyed the army of the Goths, and within it, in A.D. 274, Constantine the Great was born. The emperor Julian improved its defences but the town was destroyed by the Huns under Attila in the 5th century, and restored by Justinian. In the 9th century the Bulgarians conquered it, but ceded it to the Hungarians in the 11th century, from whom the Byzantine emperor Manuel I. took it in 1173. Towards the end of the 12th century the town was in the hands of the Serbian prince Stephen Nemanya, who there received hospitably the German emperor Frederic Barbarossa and his Crusaders. In 1375 the Turks captured Naissus from the Serbians. In 1443 the Hungarians and the Serbians retook it from the Turks, but in 1456 it again came under Turkish dominion, and remained for more than 300 years the most important Turkish military station on the road between Hungary and Constantinople. In the frequent wars between Austria and Turkey during the 17th and 18th centuries, the Austrians captured Naissus twice (in 1689 and 1737) but were unable to retain it long. In the first Serbo-Turkish rising, the Serbians, defending the approach to Nish in 1809, fired their magazine and destroyed both themselves and the enemy. The Turks built a high brick tower in which they embedded 900 Serbian skulls. The ruins are still called *Tyele-Koula* (Tower of Skulls). In the Russo-Turkish war (1877-8) the Serbians captured Nish and the town was ceded to them by the Treaty of Berlin (1878). Since then the King and the Government have resided there for three months in the year, and here also the National Assembly, before the Constitution of 1901, was regularly held. During the World War (1914-18) the Government withdrew to Nish (1915) when Belgrade was occupied by the enemy, but it was not able to stay there long.

NISHAPUR, a town in the province of Khurasan in Persia, 3,920 ft. above sea-level, in 36° 12' N., and 58° 40' E., 50 m. W. of Meshed in one of the most fertile districts of Persia, which produces much grain and cotton. The town which has somewhat shifted its position with the lapse of ages has low bastioned walls entered by four gates and enclosing a circuit of two miles. It has moderately good caravanserais and public baths, but the narrow covered lanes forming the bazaars are comparatively ill-equipped with shops. The main mosque, Jami Masjid, is fully 300 years old. Pottery making is a special industry.

Nishapur in the Old Persian is *Nev-shapur-nev*. The second element of the name is that of its traditional founder Shapur—some authorities considering that it refers to the first Shapur (241-272), others to the second (309-379). It was once one of the four great cities of Khurasan (*q.v.*), rivalling Rai (Rhages), "the mother of cities"; but the population is now reduced to 10-15,000. It was an important place in the 5th century, for Yazdajird (438-457) resided there mostly. During the later Sasanids it is seldom mentioned and when the Arabs came to Khurasan (641-642) it was of so little importance that, as the historian Tabari relates, it did not even have a garrison. But under the Tahirids (820-872) it became a flourishing city and rose to great importance during the Samanids (874-999). Toghrul, the first Seljuk ruler, made Nishapur his residence in 1037. In 1153, the Ghuzz Turkmans overran the country and partly destroyed it. In 1208 most of the town was destroyed by earthquake and was hardly rebuilt when it was again destroyed by the Mongols. It was rebuilt, suffered again at the hands of the Mongols (1269) and from another earthquake in 1280, and never

rose again to its former greatness.

Four m. S.E. of the town, in a chamber adjacent to the mosque of the Imam-zadeh Mahrak (a Moslem saint of the eighth century), is the tomb of the astronomer-poet Omar Khayyam. The sarcophagus is a simple case of brick and cement. Nearby is the grave of the celebrated poet and mystic Farid ud Din Attar. At Madan, 32 m. N.W. of Nishapur, at an elevation of 5,100 ft. are the famous mines which have supplied the world with turquoises for at least 2,000 years.

NISIBIS (Nisibin), a frontier fortress and trading town of Turkey on the Syrian border about 130 m. N.W. of Mosul, Iraq. It lies on the borderland between the mountains and the plain in 37° N. 41° E. at the point where the Yaghyagha (called in ancient times the Mygdonius) passes through a narrow canyon and enters the plain. In ancient times, and indeed until the 11th century A.D., the plain regions below the town are said to have been wooded and the town was famous for its agricultural products. Strategically, like Edessa (*q.v.*) it commanded the entrance of the valley country from the mountains and has been the site of fighting since Assyrian times to even as late as the 19th century. It also lies on the upper trade route from Mosul to the west and in times of peace has been of importance on this line.

Nisibis has been directed east or west according to the dominant empire of the time. During the Assyrian empire it formed a frontier fort against aggressions from the north, and occupied a similar position in Seleucid times. From the middle of the second century B.C. until the early years of the Christian era it was the residence of the kings of Armenia. Owing to its strength the fortress was of considerable importance during the struggle between Rome and Parthia. It became in early Christian times a religious centre with a Nestorian and a Jacobite bishop. Under the Caliphs it was a frontier fortress and the scene of continuous fighting. Finally it lost most of its prosperity owing to internal troubles, and according to the Arab chroniclers, the compulsory substitution of wheat for fruit crops. It is probable that an insufficient control of the Bedouins of the desert was responsible for much of Nisibis' lost prosperity. To-day it is still a large town of probably over 50,000 inhabitants and the railway to Konla has rendered the site of significance.

NISI PRIUS, in English law, a term used to denote generally all actions tried before judges of the king's bench division. For the history and meaning of this term see *ASSIZE*. As a rule King's Bench actions only are tried at *nisi prius*, and a judge is said to sit at *nisi prius* when he sits for the trial of actions.

NISUS, the name of two Greek legendary figures. (1) Son of Pandion of Athens and king of Megara. He had a purple lock of hair, and as long as it grew on his head the city was safe against all attacks. When Minos (*q.v.*) was besieging the city, Scylla (*q.v.*), daughter of Nisus, was bribed by him or fell violently in love with him, and to gain his favour, cut off the purple lock and gave it to him, thus betraying the city. Nisus fell, or killed himself, during the sack and was turned into a sea-eagle; Scylla swam after Minos' ship, or in punishment for her treachery was tied to the stern and dragged after it, and became a creature called *κῆρυς* or *κίρρις* (*ciris*), usually said to be a bird, as yet unidentified, but sometimes a fish; she is constantly pursued by her father. Nisus is the eponym of Nisaea, the harbour of Megara; Scylla is sometimes confused with the monster of the same name (see *ODYSSEUS*); the story is one quite common in Greek and other folklore; a combination of External Soul (see Frazer, *Golden Bough* 3rd ed., xi., chap. x.) with Maiden Castle (see Rose, *Handbook of Mythology*, chaps. viii., ix.).

See Roscher's *Lexikon*, s.v., for identification of the *ciris*; and D'Arcy Thompson in *Class. Quart.*, xix., 155 ff.

(2) A Trojan, son of Hyrtacus, friend of Euryalus, with whom he is killed in an attempt to get through the besieging force and communicate with Aeneas, Virgil, *Aen.* ix.

NITHARD (d. 844), Frankish historian, was the illegitimate son of Angilbert, the friend of Charlemagne, by Bertha, a daughter of the great emperor. He was educated at the imperial court and became abbot of St. Riquier in *commendam*, never taking the vows. He fought for Charles the Bald at Fontenoy in June 841, and died as the result of wounds received whilst fighting against the Northmen near Angoulême. The date of his death was probably June 14, 844. In the 11th century his body, with the fatal wound still visible, was found in the grave of his father, Angilbert. Nithard's historical work consists of four books on the history of the Carolingian empire under the turbulent sons of the emperor Louis I., especially during the troubled period between 840 and 843. This *Historiae* or *De dissensionibus filiorum Ludovici pii*, dedicated to Charles the Bald, is valuable for the light which it throws upon the disintegration of the Carolingian empire.

The *Historiae* has been printed several times. Perhaps the best edition is in Band ii. of the *Monumenta Germaniae historica: Scriptores*; it has also been edited by A. Holder (Freiburg, 1882). It has been translated into German by J. von Jasmund (1851; new edition by W. Wattenbach, Leipzig, 1889); and into French in tome iii. of Guizot's *Collection des mémoires* (Paris, 1824).

See O. Kuntzemüller, *Nithard und sein Geschichtswerk* (Jena, 1873); G. Meyer von Knonau, *Über Nithards vier Bücher Geschichte* (Leipzig, 1866); and W. Wattenbach, *Deutschlands Geschichtsquellen*, Band i. (1904).

NITHSDALE, WILLIAM MAXWELL, 5TH EARL OF (1676–1744), Jacobite leader, son of Robert the 4th earl (d. 1696), served the exiled house of Stuart in secret, and was suspected as a Jacobite conspirator. In 1712 he resigned his estate to his son William (d. 1776), reserving a life rent to himself. In 1715 he joined the Jacobite rebels in the north of England and was taken prisoner at Preston, being sent to London for trial. His wife followed him to London. The earl and the other Jacobites were brought to trial in Westminster Hall on Jan. 19, 1716, and condemned to death Feb. 9. The execution was fixed for the 24th. The countess presented a petition to George I. which he refused to receive. With the help of two Jacobite ladies, the countess arranged the escape of her husband from the Tower on the eve of the day fixed for his execution. They lived thenceforward in Rome. The earl died on March 20, 1744, and the countess in 1749.

See Sir A. Fraser, *The Book of Carlarverock* (Edinburgh, 1873).

NITON: see RADON.

NITRE, a name given to naturally occurring potassium nitrate; "cubic nitre" is sodium nitrate. The word is adapted from Lat. *nitrum*, which is itself adapted from Gr. *νίτρον*. These terms were originally applied to the naturally occurring sodium carbonate; the connection with potassium nitrate (*sal petrae* or *sal petrosum*) may be traced to Raymondus Lullius's name *sal nitri*, which he distinguished from *nitrum*. In the 16th century the ancient *nitrum* became altered to *natron*, a term still used for native sodium carbonate, while *nitrum*, and its adaptation nitre, were retained for potassium nitrate or saltpetre (*q.v.*).

NITRIC ACID (*aqua fortis*), an important mineral acid, HNO_3 . It is mentioned in the *De inventione veritatis* ascribed to Geber, wherein it is obtained by calcining a mixture of nitre, alum and blue vitriol. It was again described by Albert le Grand in the 13th century and by Raimon Lull, who prepared it by heating nitre and clay and called it "eau forte." Glauber devised the process in common use for many years, viz., by heating nitre with strong sulphuric acid. Its true nature was not determined until the 18th century, when A. L. Lavoisier (1776) showed that it contained oxygen, whilst in 1785 H. Cavendish determined its constitution and showed that it could be synthesized by passing a stream of electric sparks through moist air. The acid is found to exist to a slight extent in the free condition in some waters, but chiefly occurs in combination with various metals, as nitrates, principally as nitre or saltpetre, KNO_3 , and Chile saltpetre, NaNO_3 . It is formed when a stream of electric sparks is passed through moist air, and in the oxidation of nitrogenous matter in the presence of water.

For experimental purposes it is usually obtained by distilling potassium or sodium nitrate with concentrated sulphuric acid. The acid so obtained usually contains more or less water and
